2017 ACCESSORIES AND EQUIPMENT

Bolted Exterior Body Panels and Closures - Bolt EV

SPECIFICATIONS

FASTENER SPECIFICATIONS

Reusable Threaded Fastener Tightening Specifications

Application	Specification
	Metric (English)
NOTE: ***All fasteners listed in this table can be reused after removal.***	
Front Compartment Front Sight Shield Bolt	2.5 N.m (22 lb in)
Front Fender Bolt	9 N.m (80 lb in)
Front Side Door Check Link Bolt	22 N.m (16 lb ft)
Front Side Door Check Link Nut	9 N.m (80 lb in)
Front Side Door Hinge Bolt - Body Side	32 N.m (24 lb ft)
Front Side Door Lower Hinge Bolt	25 N.m (18 lb ft)
Front Side Door Upper Hinge Bolt	25 N.m (18 lb ft)
Headlamp Screw	2.5 N.m (22 lb in)
Hood Hinge Bolt	22 N.m (16 lb ft)
Hood Hinge Bracket Bolt	9 N.m (80 lb in)
Hood Hinge Nut	22 N.m (16 lb ft)
Hood Primary and Secondary Latch Bolt	9 N.m (80 lb in)
Hood Primary Latch Release Cable Handle Screw	2 N.m (18 lb in)
Liftgate Hinge Bolt	22 N.m (16 lb ft)
Liftgate Hinge Nut	43 N.m (32 lb ft)
Rear Side Door Check Link Bolt	22 N.m (16 lb ft)
Rear Side Door Check Link Nut	9 N.m (80 lb in)
Rear Side Door Hinge Bolt - Body Side	32 N.m (24 lb ft)
Rear Side Door Lower Hinge Bolt	25 N.m (18 lb ft)
Rear Side Door Upper Hinge Bolt	25 N.m (18 lb ft)

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B3006: HOOD AJAR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3006 01

Hood Ajar Circuit Short to Battery

DTC B3006 02

Hood Ajar Circuit Short to Ground

DTC B3006 04

Hood Ajar Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B3006 02	B3006 04	B3006 01	-
Ground	-	B3006 04	-	-

Circuit/System Description

The body control module (BCM) applies B+ to the hood ajar signal circuit and monitors the voltage to determine the position of the hood. When the hood is closed, the switch is open and voltage remains high. When the hood is open, the switch is closed and the voltage is pulled low.

Conditions for Running the DTC

The BCM continuously monitors for this DTC

Conditions for Setting the DTC

B3006 01

The BCM detects that the hood ajar switch signal circuit is shorted to battery.

B3006 02

The BCM detects that the hood ajar switch signal circuit is shorted to ground.

B3006 04

The BCM detects that the hood ajar switch signal circuit is open.

Action Taken When the DTC Sets

- The hood ajar switch input will be ignored as a content theft deterrent trigger.
- Remote vehicle start will be disabled.

Conditions for Clearing the DTC

- A current DTC will clear when the conditions for setting the DTC are no longer present.
- A history DTC will clear after 40 malfunction free ignition cycles.

Description and Operation

Keyless Entry System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON.
2. Verify the scan tool Hood Ajar Switch parameter is Open when the hood is open and Closed when the hood is closed.
   - **If the parameter does not change**

  Refer to Circuit/System Testing.

- **If the parameter changes**

3. All OK.

Circuit/System Testing

1. Ignition OFF and all vehicle systems OFF, disconnect the harness connector at the B55 Hood Ajar Switch. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
    - **If 10 Ω or greater**
        1. Ignition OFF
        2. Test for less than 2 Ω in the ground circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. Test for greater than 11.5 V between the signal circuit terminal 1 and ground.
    - **If 11.5 V or less**
        1. Ignition OFF, disconnect the harness connector at the K9 Body Control Module.
        2. Test for infinite resistance between the signal circuit and ground.
            - If less than infinite resistance, repair the short to ground on the circuit.
            - If Infinite resistance.
        3. Test for less than 2 Ω in the signal circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, replace the K9 Body Control Module.
    - **If greater than 11.5 V**
5. Ignition OFF, disconnect the X4 and X7 harness connector at the K9 Body Control Module. Ignition ON.
6. Test for less than 1 V between the signal circuit terminal 1 and ground.
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
7. Test or replace the B55 Hood Ajar Switch.

Component Testing

1. Ignition OFF, disconnect the harness connector at the B55 Hood Ajar Switch.
2. Test for 2738 - 3350 Ω between the signal terminal 1 and the signal terminal 2 with the hood latch in the CLOSED position.
    - **If not between 2738 - 3350 Ω**

      Replace the B55 Hood Ajar Switch.

    - **If between 2738 - 3350 Ω**
3. Test for 658 - 806 Ω between the signal terminal 2 and the ground terminal 3 with the hood latch in the CLOSED position.
    - **If not between 658 - 806 Ω**

      Replace the B55 Hood Ajar Switch.

    - **If between 658 - 806 Ω**
4. Test for 2080 - 2545 Ω between the signal terminal 1 and the ground terminal 3 with the hood latch in the CLOSED position.

- **If not between 2080 - 2545 Ω**

  Replace the B55 Hood Ajar Switch.

- **If between 2080 - 2545 Ω**

5. Test for 2738 - 3350 Ω between the signal terminal 1 and the signal terminal 2 with the hood latch in the OPEN position.
   - **If not between 2738 - 3350 Ω**

     Replace the B55 Hood Ajar Switch.

   - **If between 2738 - 3350 Ω**
6. Test for 2080 - 2545 Ω between the signal terminal 2 and the ground terminal 3 with the hood latch in the OPEN position.
   - **If not between 2080 - 2545 Ω**

     Replace the B55 Hood Ajar Switch.

   - **If between 2080 - 2545 Ω**
7. Test for 658 - 806 Ω between the signal terminal 1 and the ground terminal 3 with the hood latch in the OPEN position.
   - **If not between 658 - 806 Ω**

     Replace the B55 Hood Ajar Switch.

   - **If between 658 - 806 Ω**
8. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Hood Primary and Secondary Latch Replacement
- Control Module References for Body Control Module replacement, programming, and setup

DTC P257D-P257F: ENGINE HOOD SWITCH

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptors

DTC P257D

Engine Hood Switch Performance

DTC P257E

Engine Hood Switch Circuit Low Voltage

DTC P257F

Engine Hood Switch Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hood Ajar Switch Signal 1	B3006 02	B3006 04	B3006 01	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hood Ajar Switch Signal 2	P257E	P257F	P257F	P257D
Ground	-	B3006 04, P257F	-	-

Circuit/System Description

The Hybrid/EV Powertrain Control Module 2 applies B+ to the hood ajar signal 2 circuit and monitors the voltage to determine the position of the hood. The hood ajar switch contains a multiplexed resistor. This resistor will vary the voltage seen by the Hybrid/EV Powertrain Control Module 2 by pulling down the applied voltage based on the position of the switch.

Conditions for Running the DTC

Propulsion system is active.

Conditions for Setting the DTC

P257D

The hood ajar switch signal voltage as measured by the Hybrid/EV Powertrain Control Module 2 is not within a valid voltage range.

P257E

The Hybrid/EV Powertrain Control Module 2 detects a short to ground in the hood ajar switch signal.

P257F

The Hybrid/EV Powertrain Control Module 2 detects a short to voltage or an open/high resistance in the hood ajar switch signal.

Action Taken When the DTC Sets

The engine will start and run whenever the vehicle is in Service Mode or the vehicle speed is less than 5 kph (3 mph).

Conditions for Clearing the DTC

DTCs P257D, P257E, and P257F are Type B DTCs.

Description and Operation

Hood Ajar Indicator Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Hybrid/EV Powertrain Control Module 2 Hood Position parameter is Open when the hood is OPEN and Closed when the hood is CLOSED..
    - **If the parameter does not change**

      Refer to Circuit/System Testing.

    - **If the parameter changes**
3. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B55 Hood Ajar Switch. It may take up to two minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal C and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify DTC P257F is set as current
    - **If DTC P257F is not set as current**
    1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the signal circuit terminal A and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If DTC P257F is set as current**
5. Install a 5 A fused jumper wire between the signal circuit terminal A and ground. Vehicle in Service Mode.
6. Verify DTC P257E is set as current.
    - **If DTC P257E is not set as current**
    1. Vehicle OFF, disconnect the harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If DTC P257E is set as current**
7. Test or replace the B55 Hood Ajar Switch.

Component Testing

1. Vehicle OFF, disconnect the harness connector at the B55 Hood Ajar Switch.
2. Test for 2738 - 3350 Ω between the signal terminal A and the signal terminal B with the hood latch in the CLOSED position.

  - **If not between 2738 - 3350 Ω**

    Replace the B55 Hood Ajar Switch.

  - **If between 2738 - 3350 Ω**

3. Test for 658 - 806 Ω between the signal terminal A and the ground terminal C with the hood latch in the CLOSED position.
   - **If not between 658 - 806 Ω**

     Replace the B55 Hood Ajar Switch.

   - **If between 658 - 806 Ω**

4. Test for 2080 - 2545 Ω between the signal terminal B and the ground terminal C with the hood latch in the CLOSED position.
   - **If not between 2080 - 2545 Ω**

     Replace the B55 Hood Ajar Switch.

   - **If between 2080 - 2545 Ω**

5. Test for 2738 - 3350 Ω between the signal terminal A and the signal terminal B with the hood latch in the OPEN position.
   - **If not between 2738 - 3350 Ω**

     Replace the B55 Hood Ajar Switch.

   - **If between 2738 - 3350 Ω**

6. Test for 2080 - 2545 Ω between the signal terminal A and the ground terminal C with the hood latch in the OPEN position.
   - **If not between 2080 - 2545 Ω**

     Replace the B55 Hood Ajar Switch.

   - **If between 2080 - 2545 Ω**

7. Test for 658 - 806 Ω between the signal terminal B and the ground terminal C with the hood latch in the OPEN position.
   - **If not between 658 - 806 Ω**

     Replace the B55 Hood Ajar Switch.

   - **If between 658 - 806 Ω**

8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Hood Primary and Secondary Latch Replacement**
- **Control Module References** for Hybrid/EV Powertrain Control Module 2 replacement, programming, and setup

SYMPTOMS - BOLTED EXTERIOR BODY PANELS AND CLOSURES

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data links.

2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Hood Ajar Indicator Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **Hood Ajar Indicator/Message Malfunction** in order to diagnose the symptom.

HOOD AJAR INDICATOR/MESSAGE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Callout	Component Name

Callout	Component Name
1	Front Side Door Check Link Bolt **CAUTION:** Fastener Caution **Tighten** 22 N.m (16 lb ft)
2	Front Side Door Upper Hinge Bolt (Qty: 2) **Tighten** 25 N.m (18 lb ft)
3	Front Side Door Lower Hinge Bolt (Qty: 2) **Tighten** 25 N.m (18 lb ft) **Procedure** 1. Apply tape to the fender and door edges to protect the surfaces. 2. Support the door before removing the hinge bolts. 3. Disconnect the electrical connector. 4. Reposition the door away from the vehicle to gain access to the connector.
4	Front Side Door **Procedure** 1. Transfer all of the internal components. 2. Adjust the front side door as needed. Front Side Door Adjustment.

REAR SIDE DOOR ADJUSTMENT

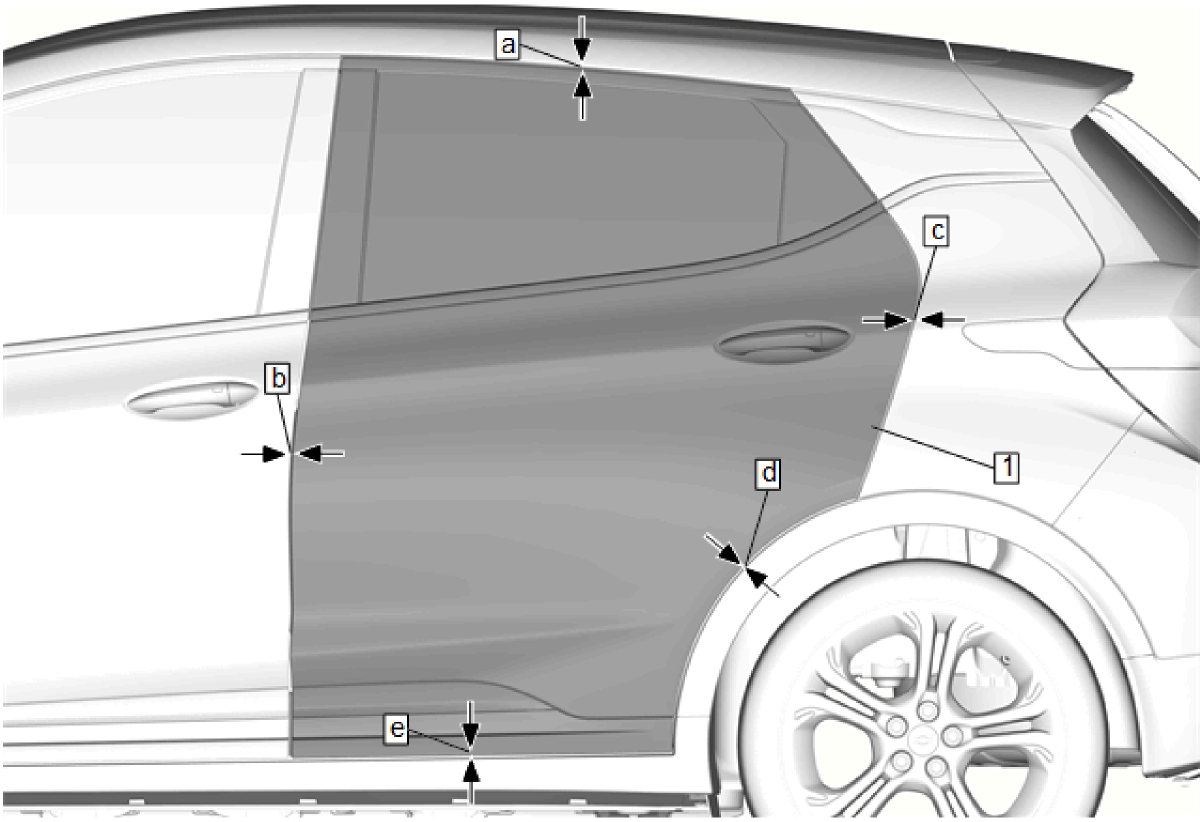

Fig. 24: Adjusting Rear Side Door
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
1	Rear Side Door **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Loosen the 4 rear door hinge bolts to adjust the rear door. 2. Adjust the rear door in order to obtain an even gap between the rear door and the body side, the quarter outer panel, the wheelhouse molding, the rocker panel and the front side door. **Adjustment** • Rear side door to bodyside (a) 5.0 mm Ã,Â± 1.0 mm (0.19 in Ã,Â± 0.04 in) • Rear side door to front side door (b) 4.0 mm Ã,Â± 0.75 mm (0.16 in Ã,Â± 0.03 in) • Rear side door to quarter outer panel (c) 4.0 mm Ã,Â± 0.75 mm (0.16 in Ã,Â± 0.03 in) • Rear side door to wheelhouse molding (d) 4.5 mm Ã,Â± 1.0 mm (0.18 in Ã,Â± 0.04 in) • Rear side door to rocker panel (e) 5.5 mm Ã,Â± 1.5 mm (0.21 in Ã,Â± 0.06 in) **Tighten** 32 N.m (24 lb ft)

REAR SIDE DOOR REPLACEMENT

Callout	Component Name

Callout	Component Name
1	Rear Side Door Check Link Bolt **CAUTION:** Fastener Caution **Tighten** 22 N.m (16 lb ft)
2	Rear Side Door Upper Hinge Bolt (Qty: 2) **Tighten** 25 N.m (18 lb ft)
3	Rear Side Door Lower Hinge Bolt (Qty: 2) **Tighten** 25 N.m (18 lb ft) **Procedure** 1. Disconnect the electrical connector. 2. Support the door before removing the hinge bolts.
4	Rear Side Door **Procedure** 1. Transfer all of the internal components. 2. Adjust the rear side door as needed. **Rear Side Door Adjustment**

FRONT FENDER REPLACEMENT - LEFT SIDE

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

CAUTION: **When removing body panels, apply tape to corners of panel and adjacent**

surfaces to help prevent paint damage.

1. Disable the high voltage system. High Voltage Disabling

LIFTGATE ADJUSTMENT

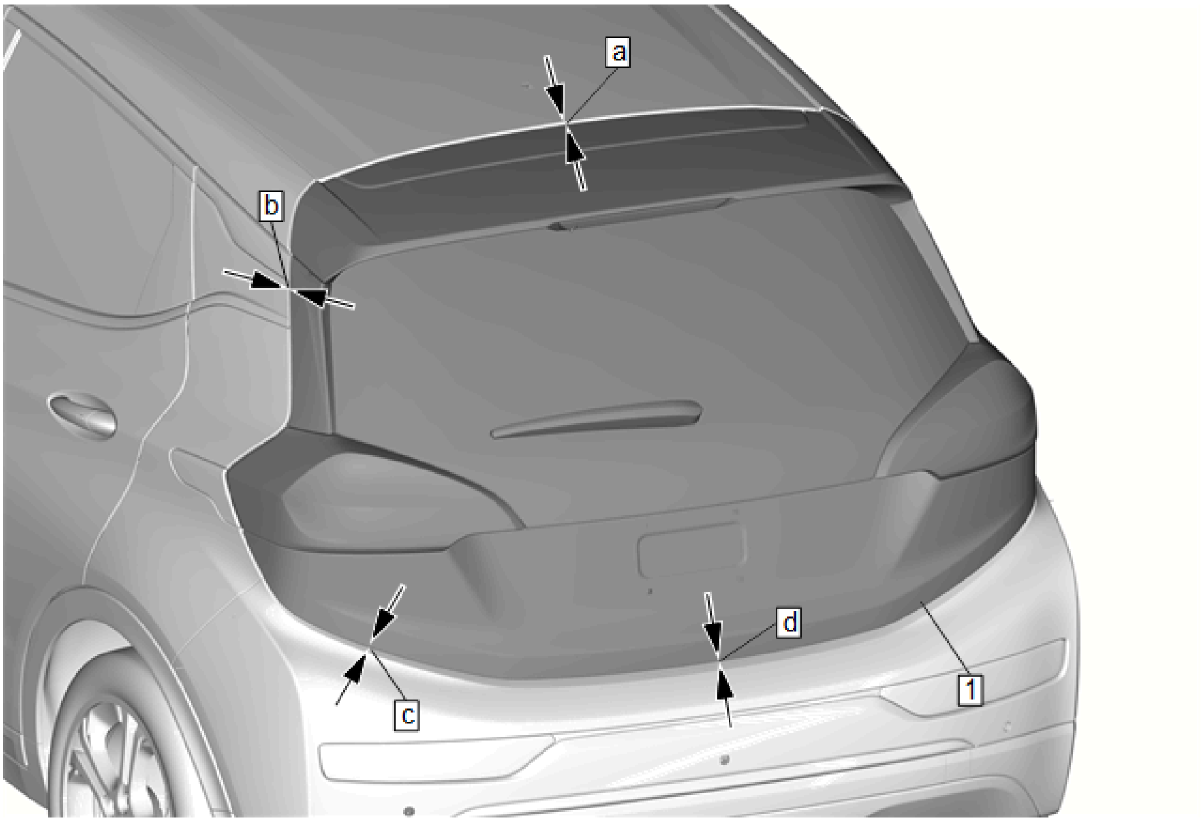

Fig. 43: Adjusting Liftgate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
1	Liftgate **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Loosen the four liftgate hinge bolts to adjust the liftgate. 2. Adjust the liftgate in order to obtain an even gap between the liftgate and the roof, the quarter applique and the rear bumper fascia. **Adjustment** - Liftgate to roof (a) 5.5 mm Ã,Â± 1.0 mm (0.22 in Ã,Â± 0.04 in) - Quarter applique to body side (b) 4.5 mm Ã,Â± 1.2 mm (0.18 in Ã,Â± 0.05 in) - Liftgate to rear bumper fascia (c) 5.0 mm Ã,Â± 1.25 mm (0.19 in Ã,Â± 0.05 in) - Liftgate to rear bumper fascia (d) 5.5 mm Ã,Â± 1.25 mm (0.20 in Ã,Â± 0.05 in) **Tighten** 22 N.m (16 lb ft)

LIFTGATE REPLACEMENT

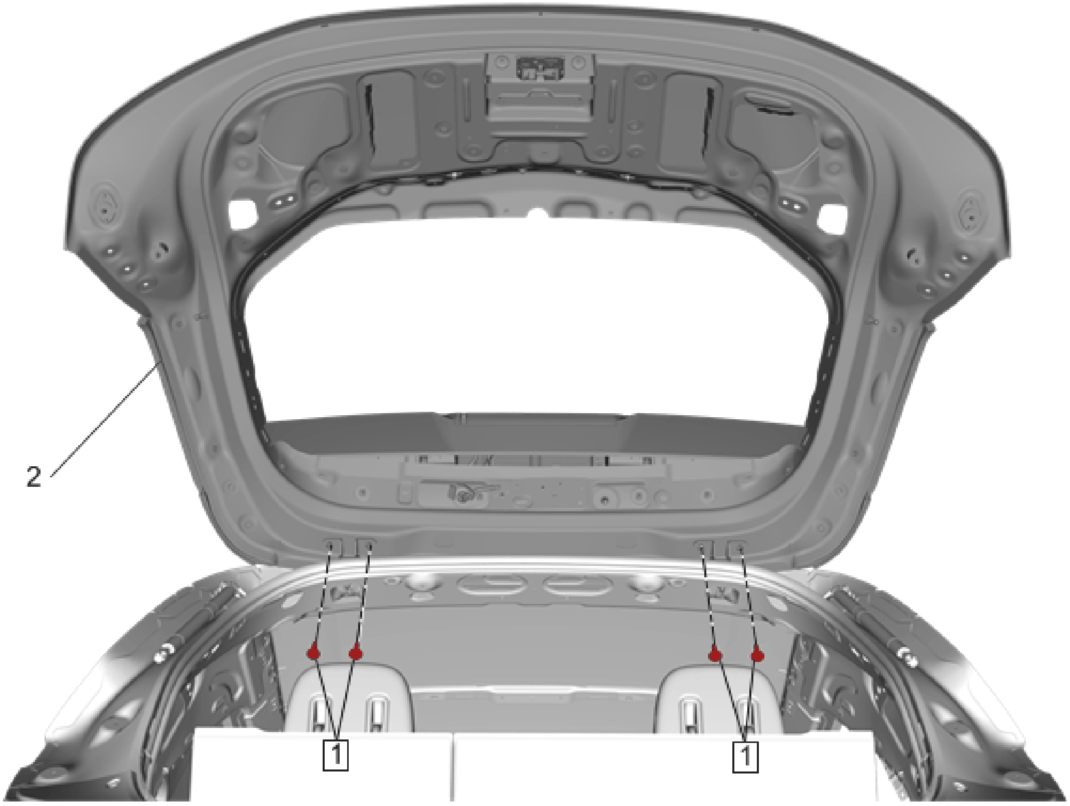

Fig. 44: Liftgate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
	WARNING: **When a lift gate hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.** **Preliminary Procedure** 1. Liftgate Upper Center Trim Finish Panel Replacement 2. Release the liftgate strut from the liftgate. Liftgate Strut Replacement
1	Liftgate Hinge Bolt **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Disconnect the electrical connector. 2. Pull the liftgate wiring grommet, the connectors, and the rear washer hose out of the body. 3. Mark the location of the liftgate hinges to the body with a grease pencil. **Tighten** 22 N.m (16 lb ft)
2	Liftgate **Procedure** 1. With the aid of an assistant, remove the liftgate. 2. Transfer components as necessary. 3. Adjust liftgate as needed. Liftgate Adjustment

FRONT SIDE DOOR WIRING HARNESS REPLACEMENT

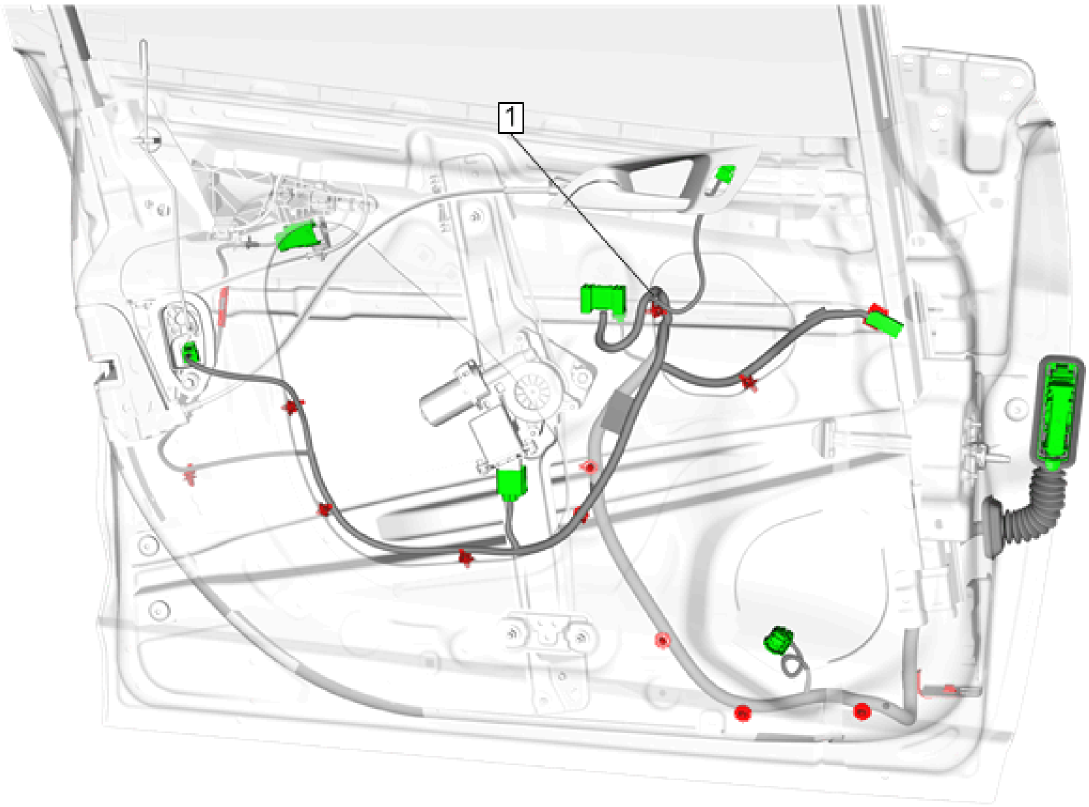

Fig. 45: Front Side Door Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Front Side Door Replacement 2. Front Side Door Trim Replacement 3. Front Side Door Water Deflector Replacement 4. Radio Front Side Door Speaker Replacement	
1	Front Side Door Wiring Harness **Procedure** Disconnect all electrical connectors and unclip harness.

LIFTGATE WIRING HARNESS REPLACEMENT

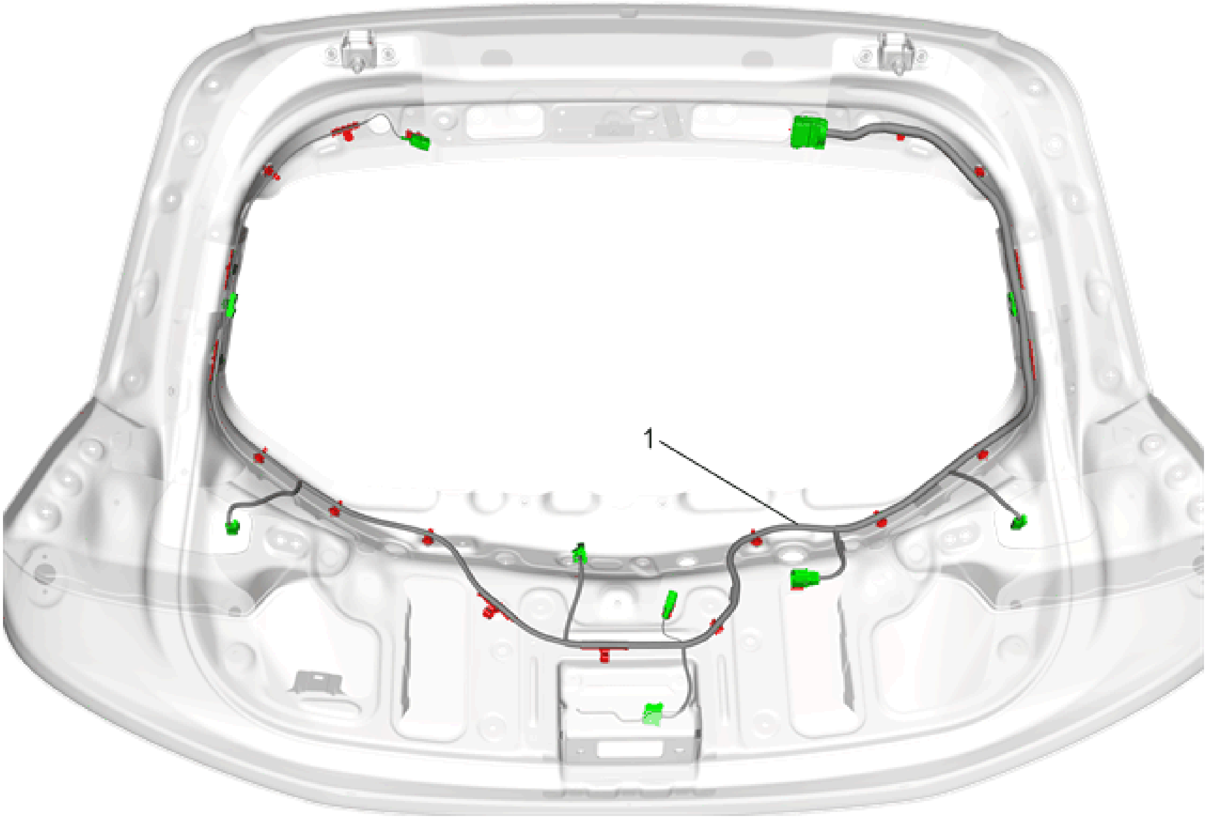

Fig. 46: Liftgate Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Liftgate Upper Side Trim Finish Panel Replacement 2. Liftgate Upper Center Trim Finish Panel Replacement 3. Liftgate Lower Trim Finish Panel Replacement	
1	Liftgate Wiring Harness **Procedure** Disconnect all electrical connectors.

LIFTGATE JUMPER WIRING HARNESS REPLACEMENT

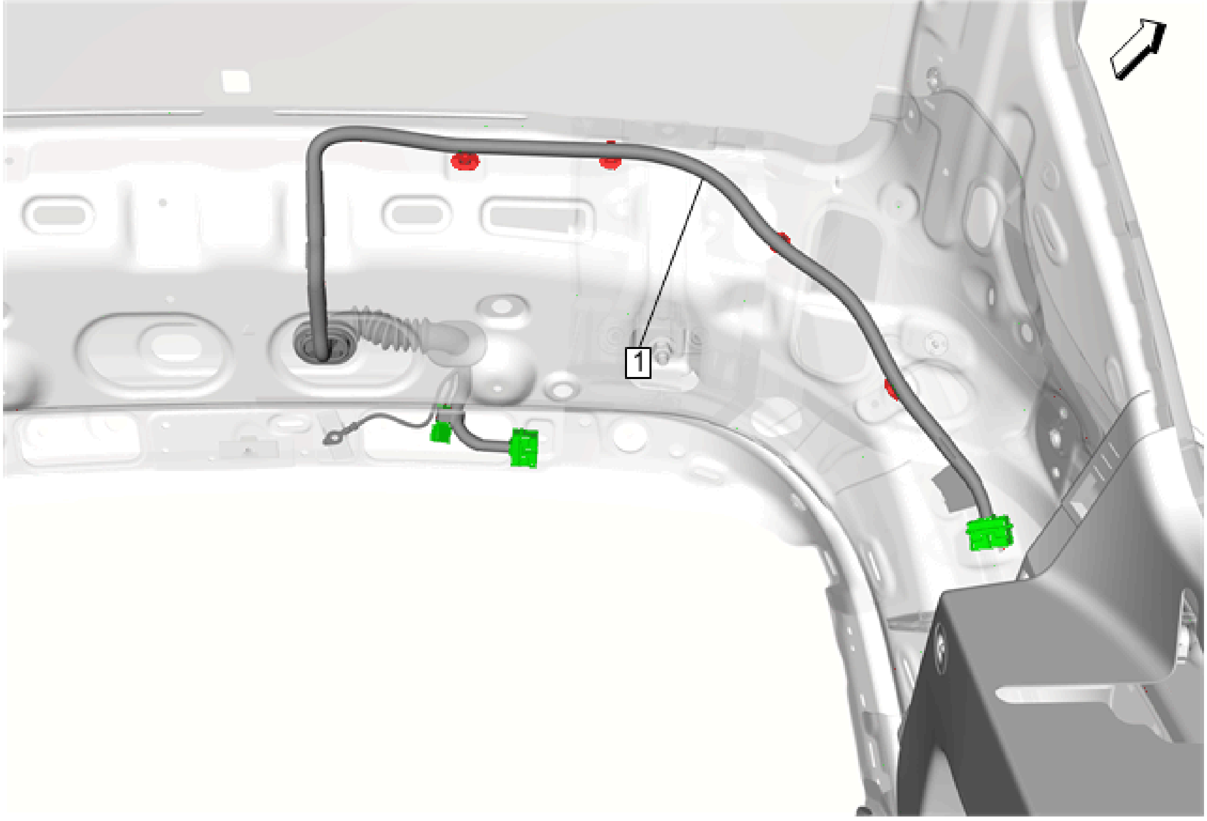

Fig. 47: Liftgate Jumper Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Liftgate Upper Center Trim Finish Panel Replacement 2. Lower the rear portion of headlining trim to gain access. Do not need to completely remove the headlining trim. Headlining Trim Panel Replacement	
1	Liftgate Jumper Wiring Harness **Procedure** Disconnect all electrical connectors.

REAR SIDE DOOR WIRING HARNESS REPLACEMENT

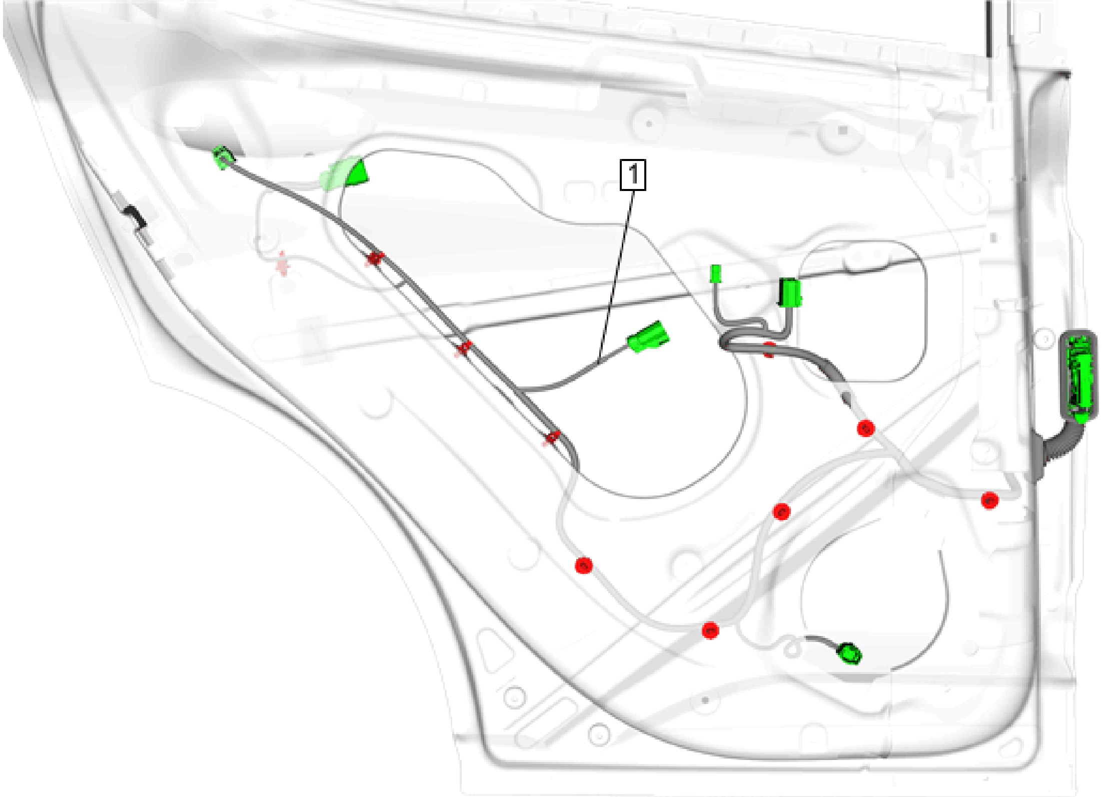

Fig. 48: Rear Side Door Wiring Harness
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Rear Side Door Trim Replacement 2. Rear Side Door Water Deflector Replacement 3. Radio Rear Side Door Speaker Replacement	
1	Rear Side Door Wiring Harness **Procedure** Disconnect all electrical connectors and unclip harness.

HOOD PRIMARY LATCH RELEASE CABLE HANDLE REPLACEMENT

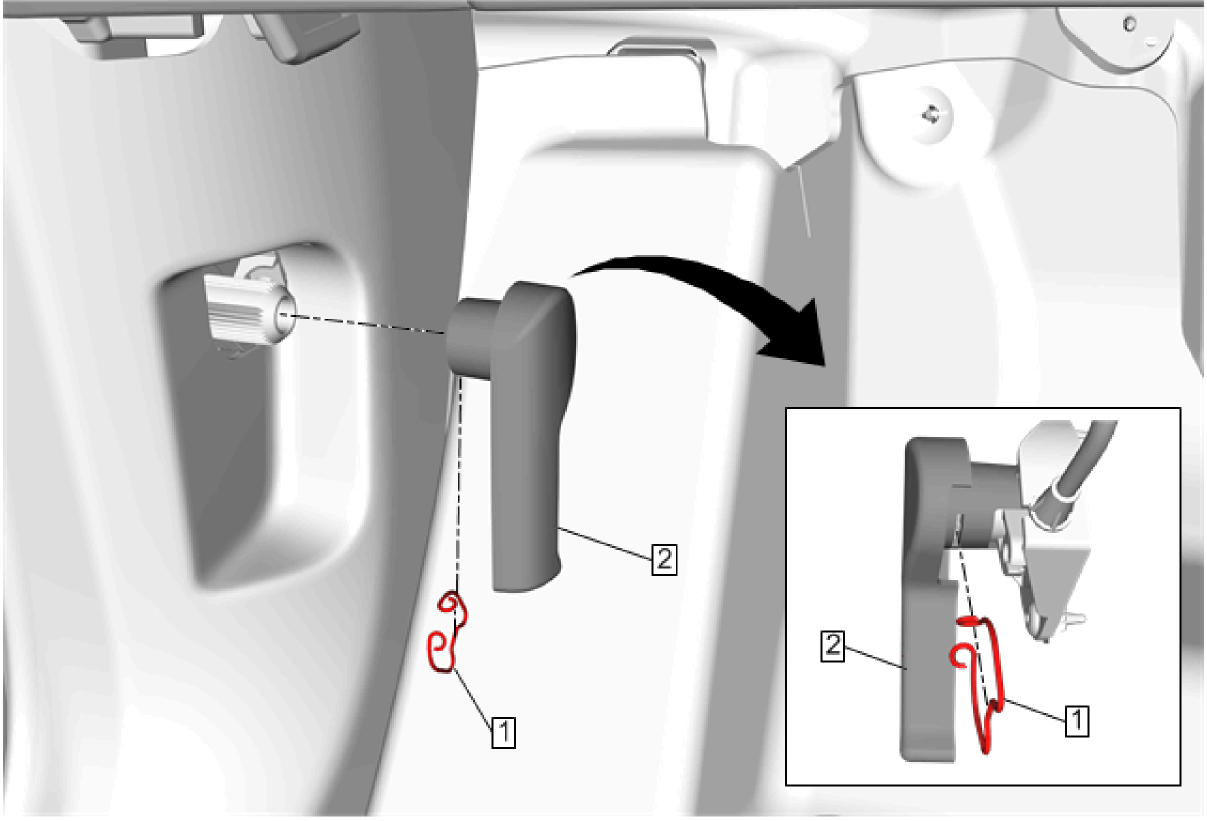

Fig. 49: Hood Primary Latch Release Cable Handle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Hood Primary Latch Release Cable Handle Clip **Procedure** Pull down to remove the clip from the hood primary latch release cable handle.
2	Hood Primary Latch Release Cable Handle

FRONT SIDE DOOR UPPER HINGE AND LOWER HINGE REPLACEMENT

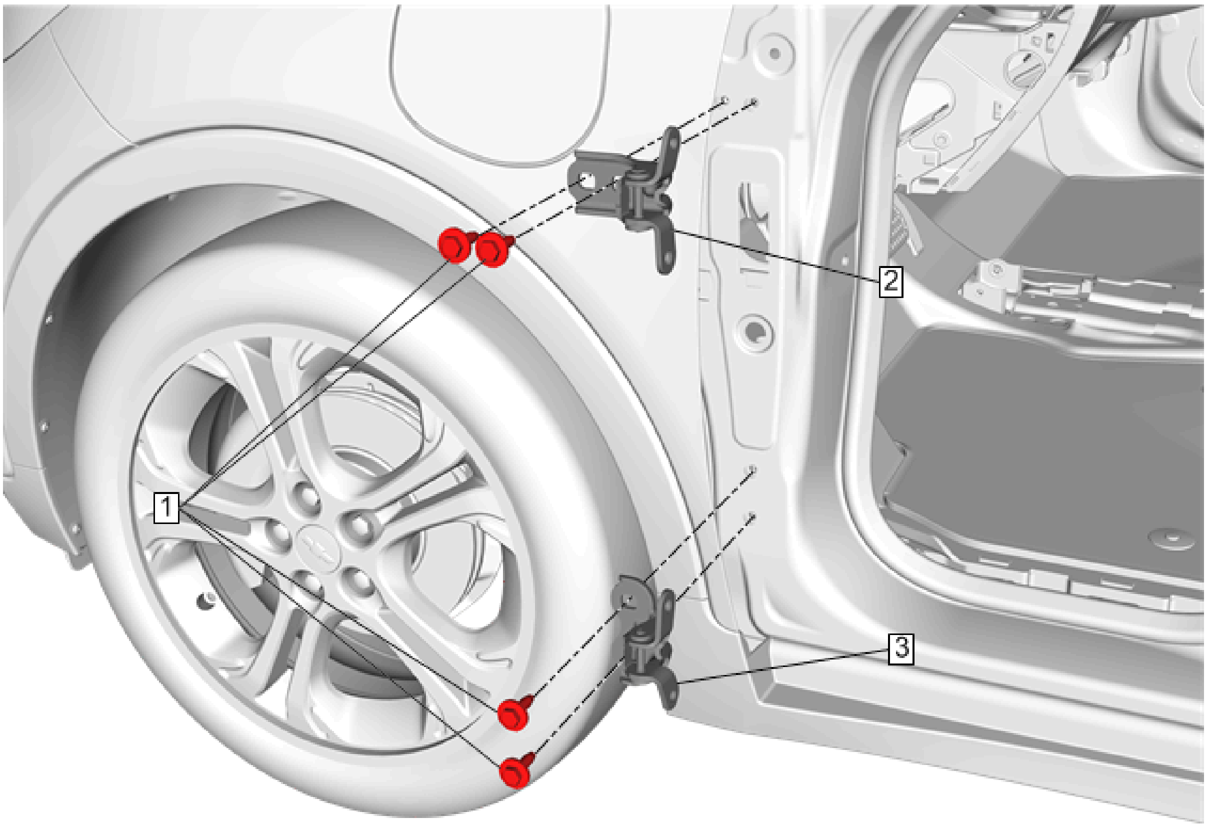

Fig. 50: Front Side Door Upper Hinge and Lower Hinge
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. **Front Side Door Replacement** 2. Mark the location of the old hinges.	
1	Front Side Door Hinge Bolt (Qty: 4) **CAUTION:** **Fastener Caution** **Tighten** 32 N.m (24 lb ft)
2	Front Side Door Upper Hinge
3	Front Side Door Lower Hinge **Procedure** Adjust the front side door as needed. **Front Side Door Adjustment**

HOOD HINGE REPLACEMENT

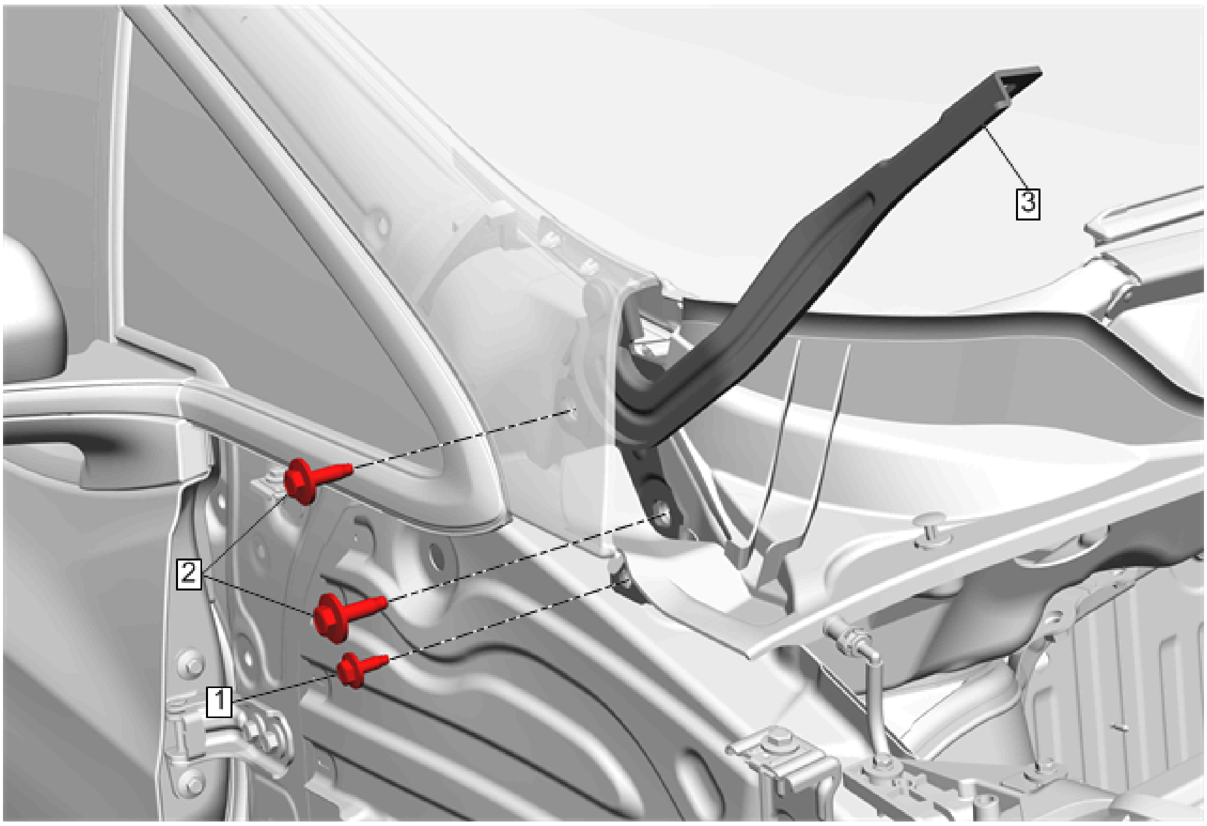

Fig. 51: Hood Hinge
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. **Hood Replacement** 2. **Front Fender Replacement - Left Side** 3. **Front Fender Replacement - Right Side**	

Callout	Component Name
1	Hood Hinge Bracket Bolt **CAUTION:** **Fastener Caution** **Tighten** 9 N.m (80 lb in)
2	Hood Hinge Bolt (Qty: 2) **Tighten** 22 N.m (16 lb ft)
3	Hood Hinge **Procedure** Adjust the hood and hinge if needed. **Hood Adjustment**

LIFTGATE HINGE REPLACEMENT

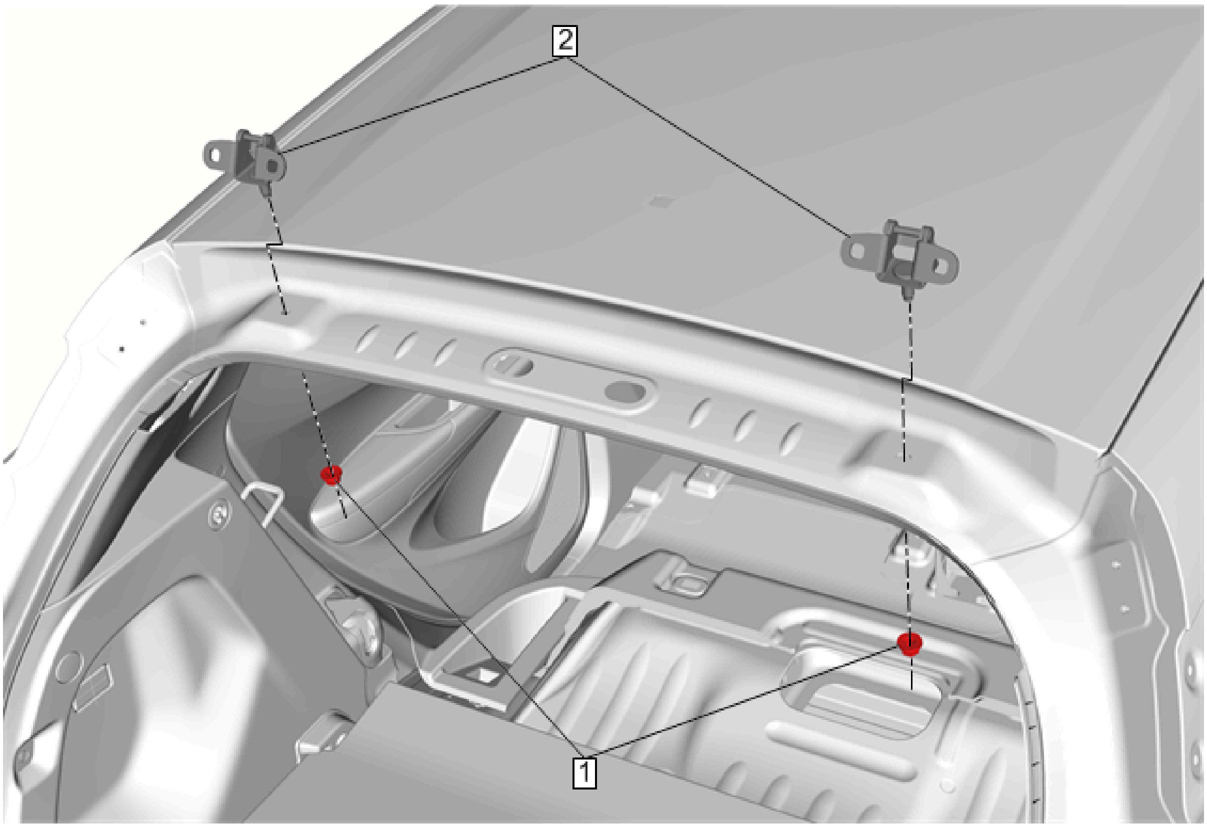

Fig. 52: Liftgate Hinge
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. **Liftgate Replacement** 2. Lower the rear headliner enough to access the liftgate hinge nuts. **Headlining Trim Panel Replacement** . 3. Use a grease pencil to mark the liftgate hinge position to the body prior to removal.	

Callout	Component Name
1	Liftgate Hinge Nut (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 43 N.m (32 lb ft)
2	Liftgate Hinge

REAR SIDE DOOR UPPER HINGE AND LOWER HINGE REPLACEMENT

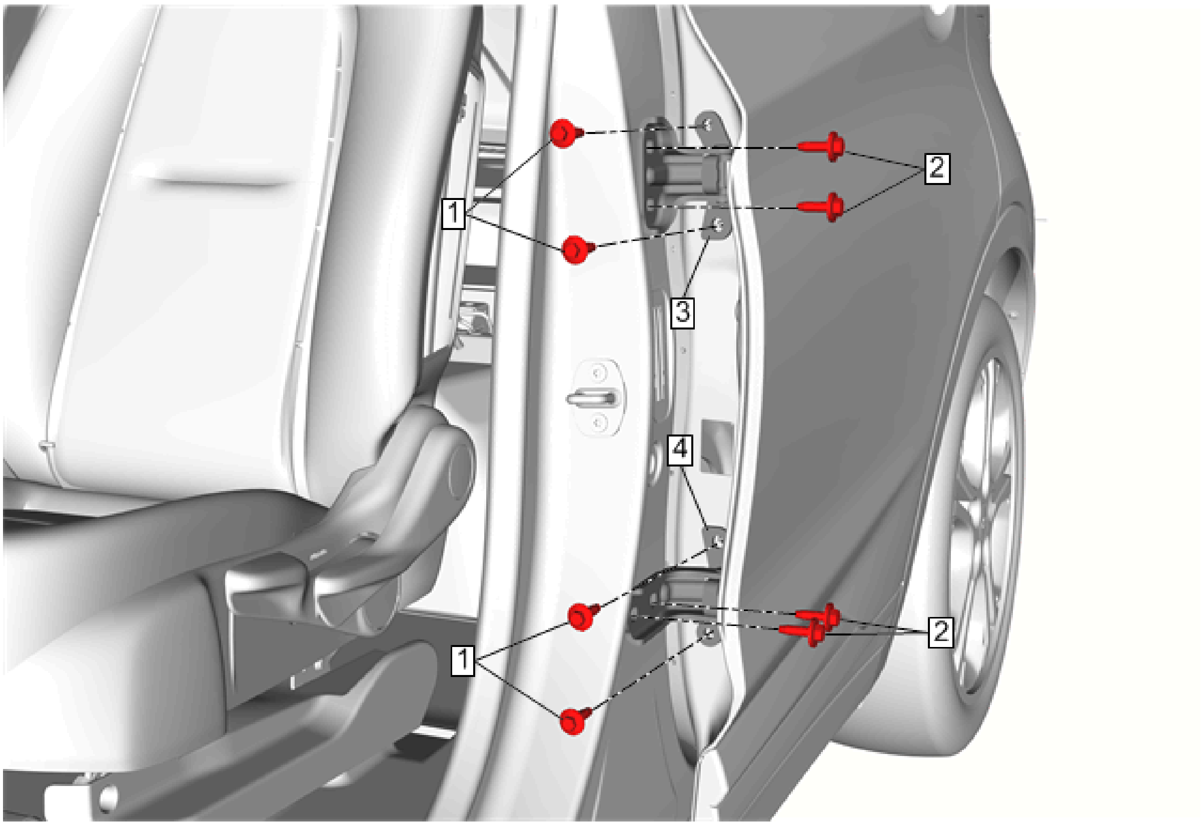

Fig. 53: Rear Side Door Upper Hinge and Lower Hinge
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Mark the location of the old hinges.	
1	Rear Side Door Hinge Bolt-Door Side (Qty: 4) **CAUTION:** **Fastener Caution** **Tighten** 25 N.m (18 lb ft)
2	Rear Side Door Hinge Bolt-Body Side (Qty: 4) **Tighten** 32 N.m (24 lb ft)
3	Rear Side Door Upper Hinge

Callout	Component Name
4	Rear Side Door Lower Hinge **Procedure** 1. Leave the rear door closed. And open the front door. 2. Replace one hinge at a time. 3. Adjust the rear side door as needed. **Rear Side Door Adjustment**

HOOD ADJUSTMENT

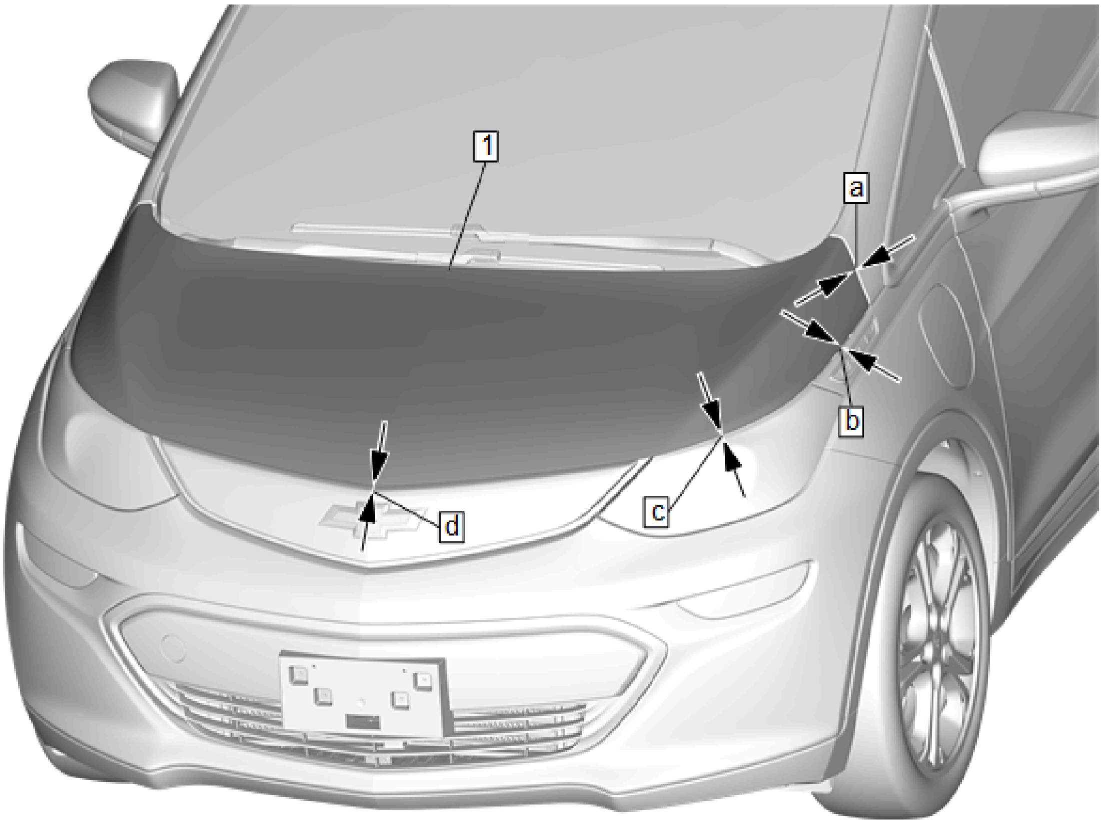

Fig. 54: Adjusting Hood
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
1	Hood **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Loosen the four hood hinge bolt. 2. Adjust the hood in order to obtain an even gap on both sides between the hood and the A-pillar, the fender applique, the headlamp and the grille. **Adjustment** • Hood to A-pillar (a) 3.0 mm Ã,Â± 1.0 mm (0.12 in Ã,Â± 0.04 in) • Hood to fender applique (b) 3.0 mm Ã,Â± 0.75 mm (0.12 in Ã,Â± 0.03 in) • Hood to headlamp (c) 3.0 mm Ã,Â± 0.9 mm (0.12 in Ã,Â± 0.035 in) • Hood to grille (d) 6.0 mm Ã,Â± 1.0 mm (0.24 in Ã,Â± 0.04 in) **Tighten** 22 N.m (16 lb ft)

HOOD REPLACEMENT

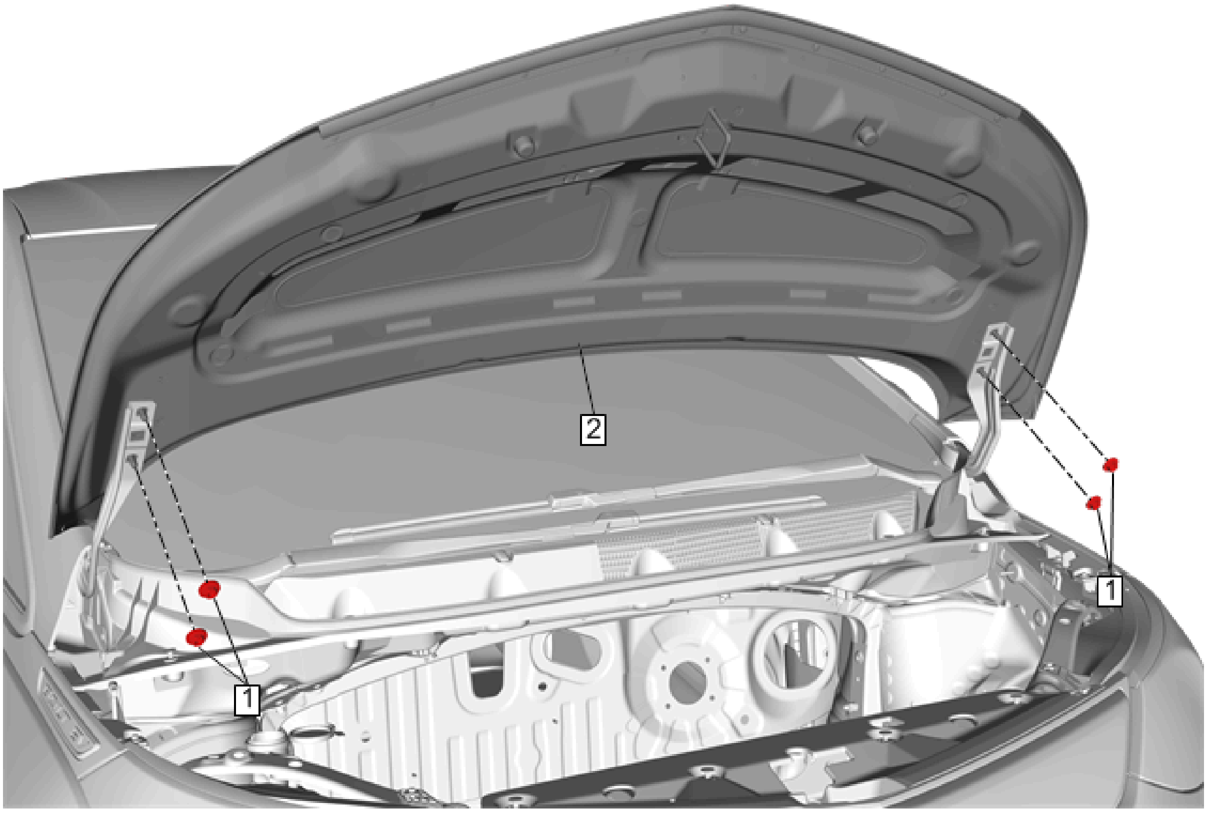

Fig. 55: Hood

Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
1	Hood Hinge Nut (Qty: 4) **CAUTION:** **Refer to Fastener Caution .** **Procedure** Mark the hinge to hood position with grease pencil. **Tighten** 22 N.m (16 lb ft)
2	Hood **WARNING:** **When a hood hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.** **Procedure** 1. Remove the hood with the aid of an assistant. 2. Transfer components as necessary. 3. Adjust hood as needed. **Hood Adjustment**

FRONT FENDER INSULATOR REPLACEMENT

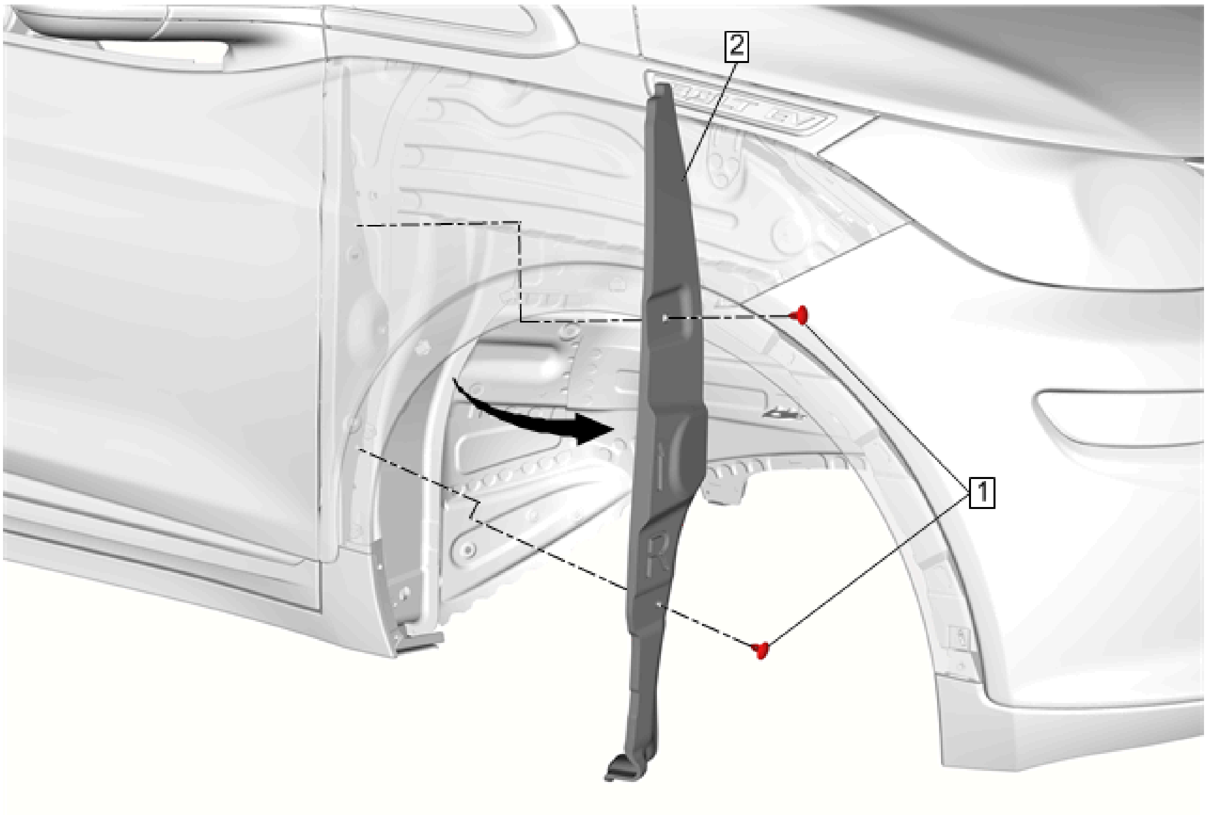

Fig. 56: Front Fender Insulator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure **Front Wheelhouse Liner Replacement**	
1	Front Fender Insulator Retainer (Qty: 2)
2	Front Fender Insulator

HOOD INSULATOR REPLACEMENT

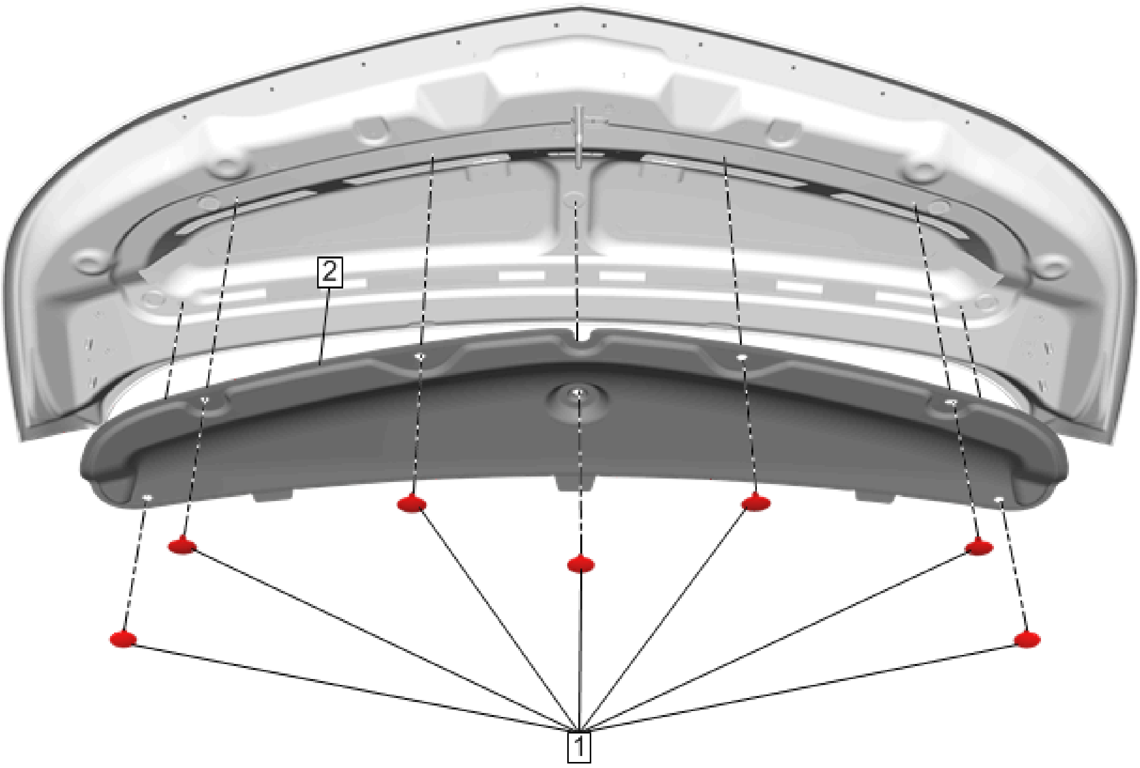

Fig. 57: Hood Insulator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Open the hood.	
1	Hood Insulator Retainer (Qty: 7) **Procedure** Using a suitable flat-bladed tool, remove the hood insulator retainers.
2	Hood Insulator

HOOD PRIMARY AND SECONDARY LATCH REPLACEMENT

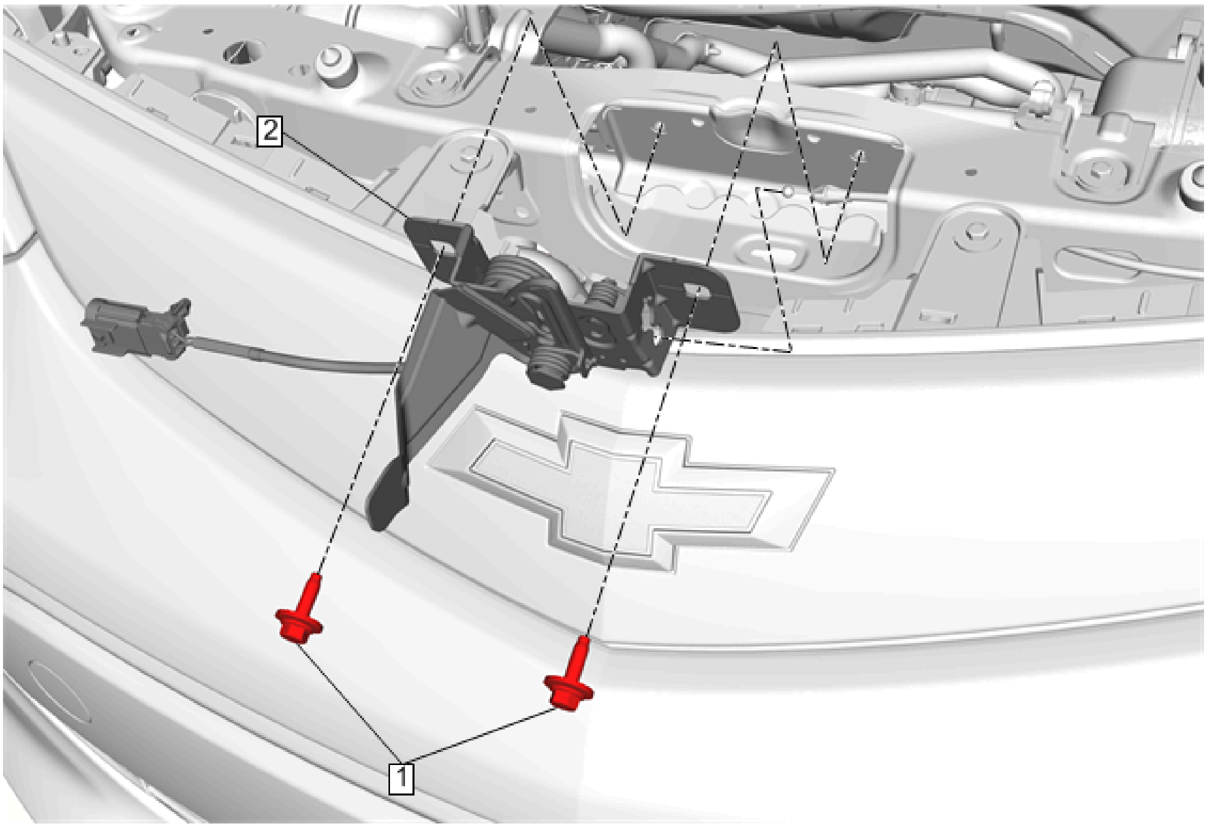

Fig. 58: Hood Primary and Secondary Latch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures Front Compartment Front Sight Shield Replacement	
1	Hood Primary and Secondary Latch Bolt (Qty: 2) **CAUTION:** Fastener Caution **Tighten** 9 N.m (80 lb in)
2	Hood Primary and Secondary Latch **Procedure** 1. Disconnect the release cable from the hood primary latch. 2. Unclip and disconnect the electrical connector.

FRONT SIDE DOOR CHECK LINK REPLACEMENT

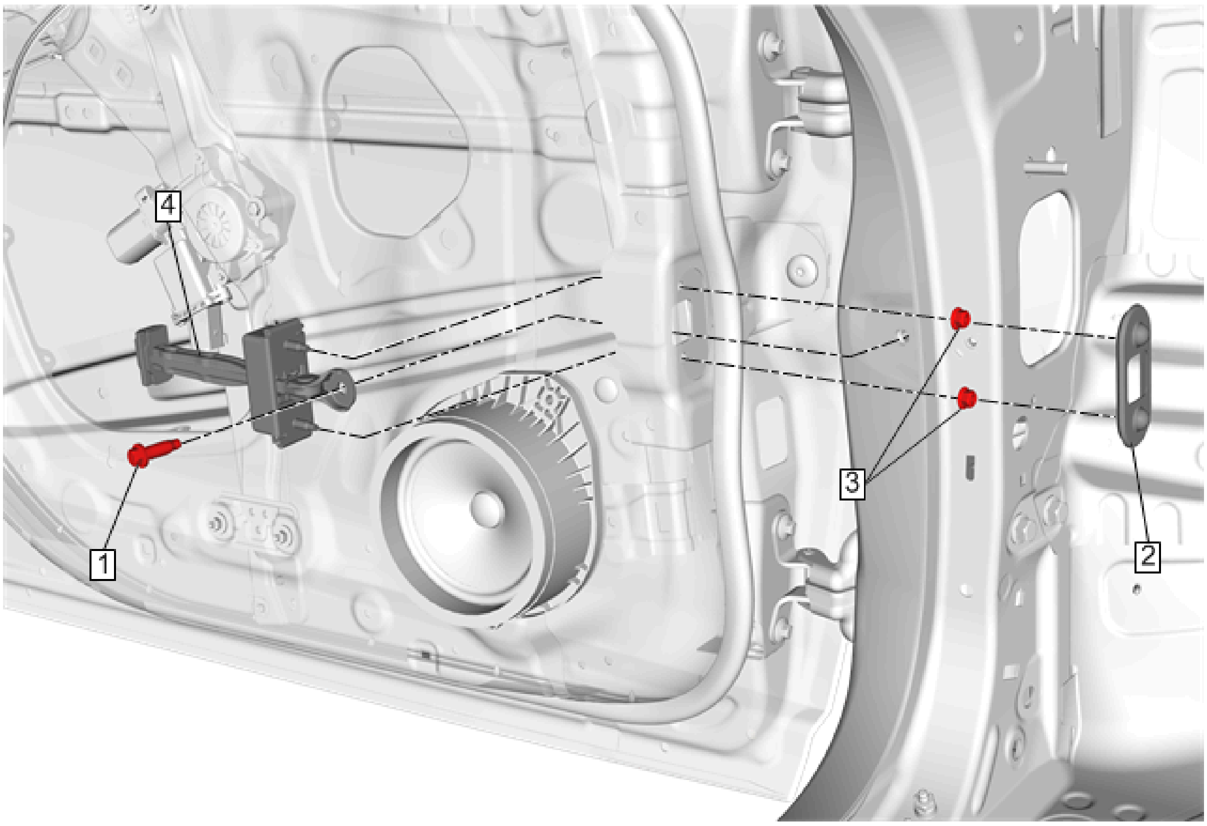

Fig. 59: Front Side Door Check Link
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Place the window in the full up position. 2. Front Side Door Trim Replacement 3. Front Side Door Water Deflector Replacement	

Callout	Component Name
1	Front Side Door Check Link Bolt **CAUTION:** **Fastener Caution** **Tighten** 22 N.m (16 lb ft)
2	Front Side Door Check Link Grommet
3	Front Side Door Check Link Nut (Qty: 2) **Tighten** 9 N.m (80 lb in)
4	Front Side Door Check Link

REAR SIDE DOOR CHECK LINK REPLACEMENT

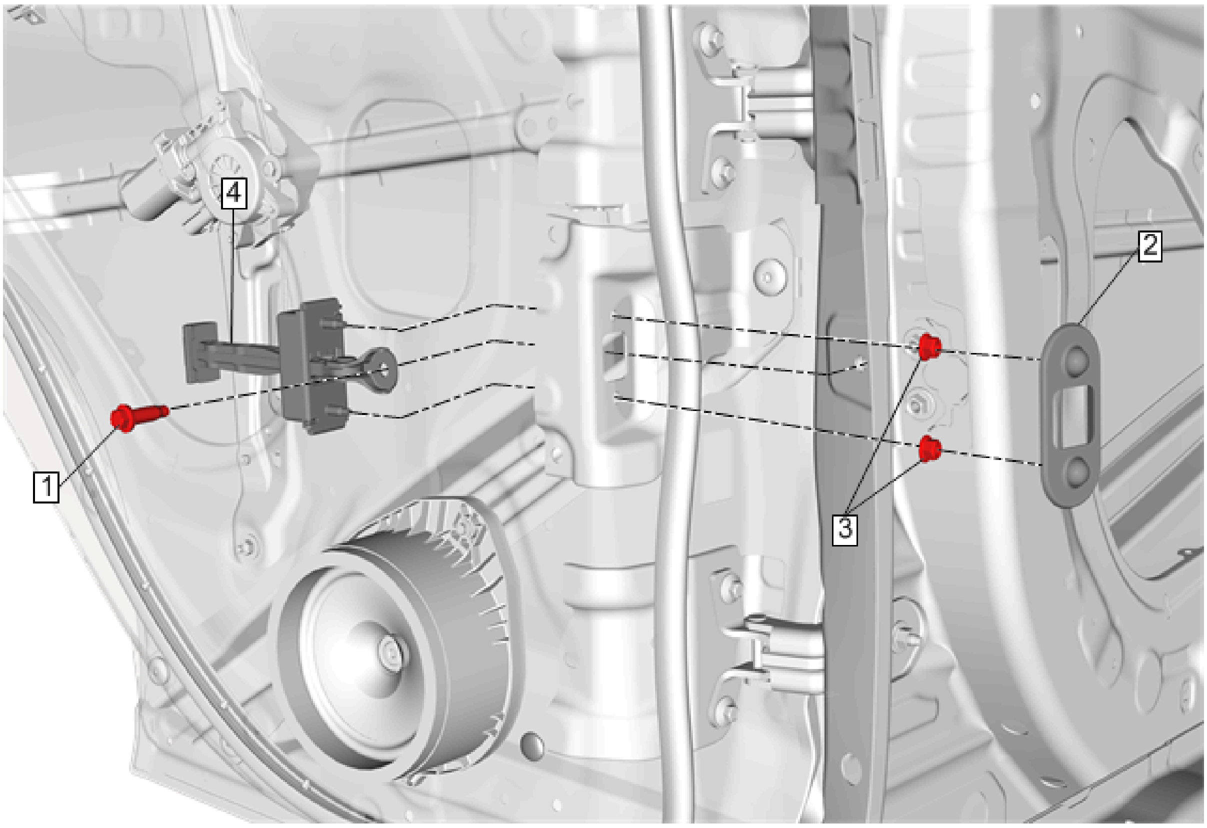

Fig. 60: Rear Side Door Check Link
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Place the window in the full up position. 2. Rear Side Door Trim Replacement 3. Rear Side Door Water Deflector Replacement	
1	Rear Side Door Check Link Bolt **CAUTION:** **Fastener Caution** **Tighten** 22 N.m (16 lb ft)
2	Rear Side Door Check Link Grommet

Callout	Component Name
3	Rear Side Door Check Link Nut (Qty: 2) **Tighten** 9 N.m (80 lb in)
4	Rear Side Door Check Link

HOOD HOLD-OPEN ROD REPLACEMENT

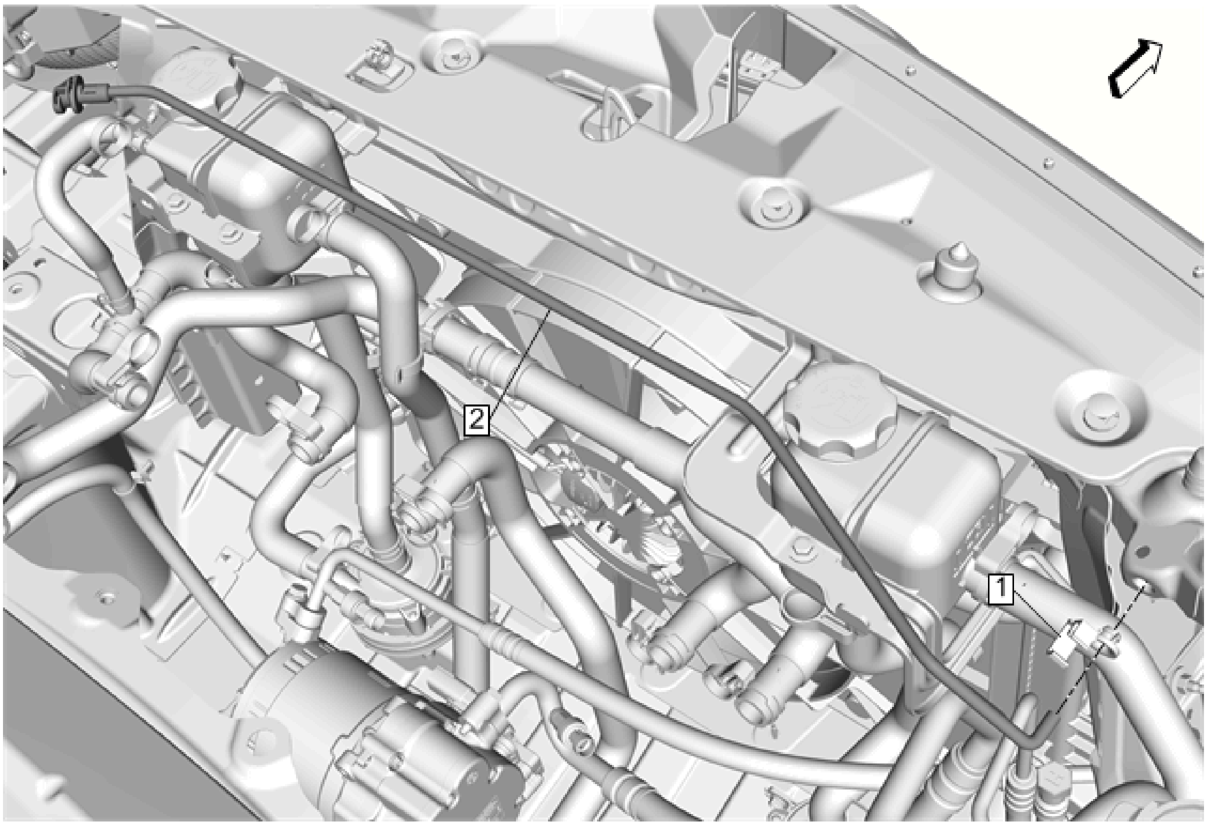

Fig. 61: Hood Hold-Open Rod
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Hood Hold-Open Rod Pivot **WARNING:** **When a hood hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.** **Procedure** 1. Install an alternative hood support. 2. Release the retaining feature on the rod pivot.
2	Hood Hold-Open Rod **Procedure** Remove the rod from the vehicle.

HOOD HOLD-OPEN ROD PIVOT REPLACEMENT

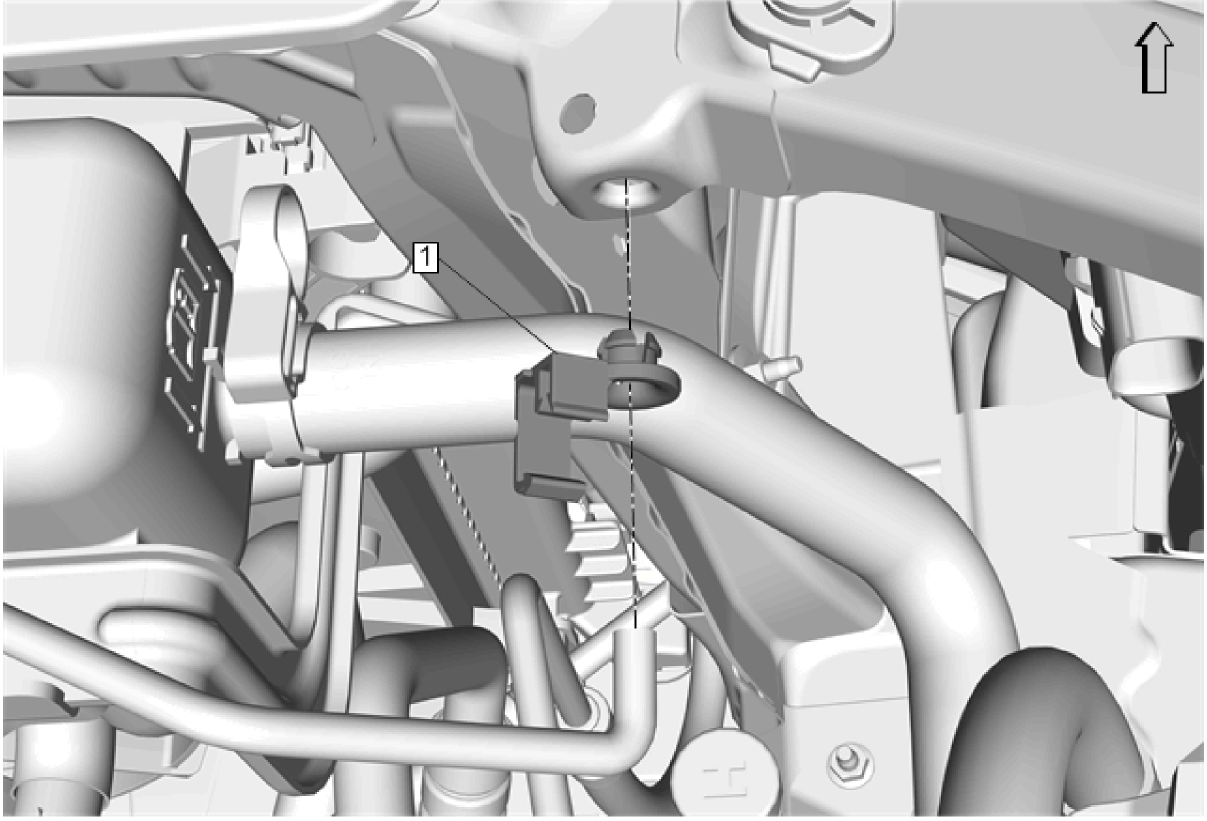

Fig. 62: Hood Hold-Open Rod Pivot
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures Hood Hold-Open Rod Replacement	
1	Hood Hold-Open Rod Pivot **WARNING:** **When a hood hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.**

HOOD FRONT WEATHERSTRIP REPLACEMENT

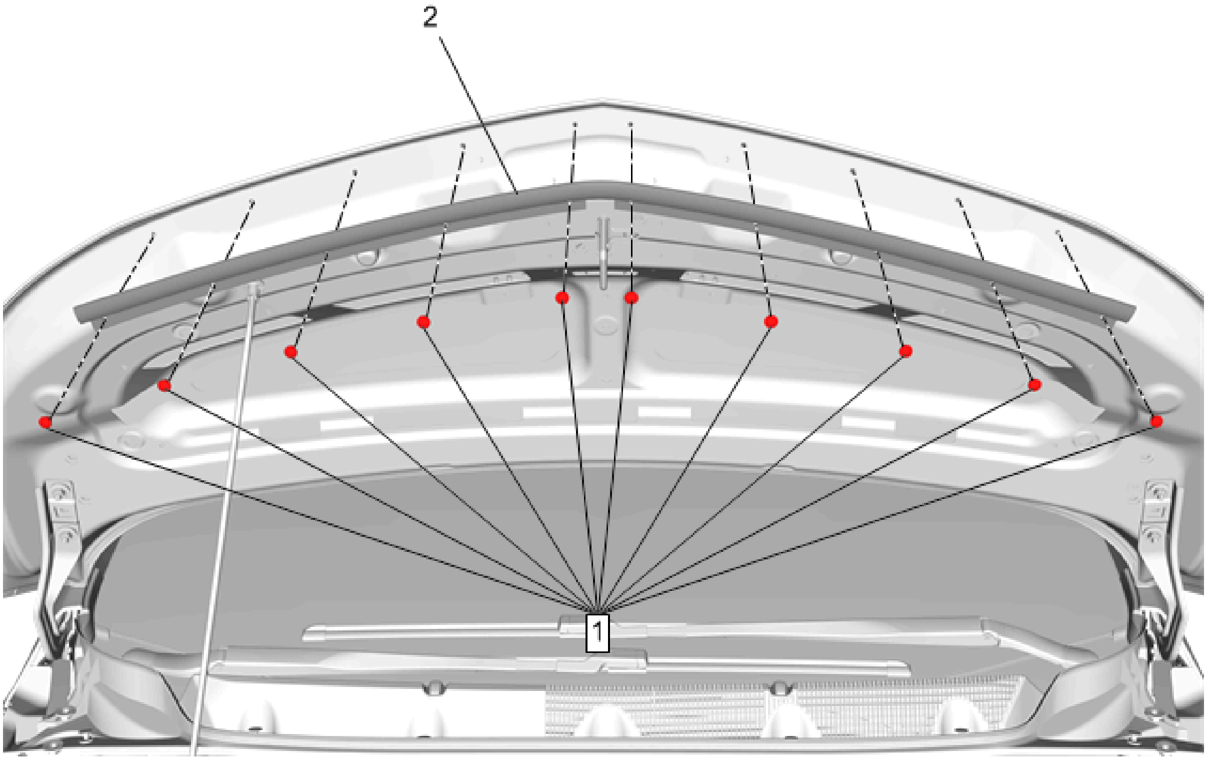

Fig. 63: Hood Front Weatherstrip
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Hood Front Weatherstrip Retainer
2	Hood Front Weatherstrip

FRONT COMPARTMENT FRONT SIGHT SHIELD REPLACEMENT

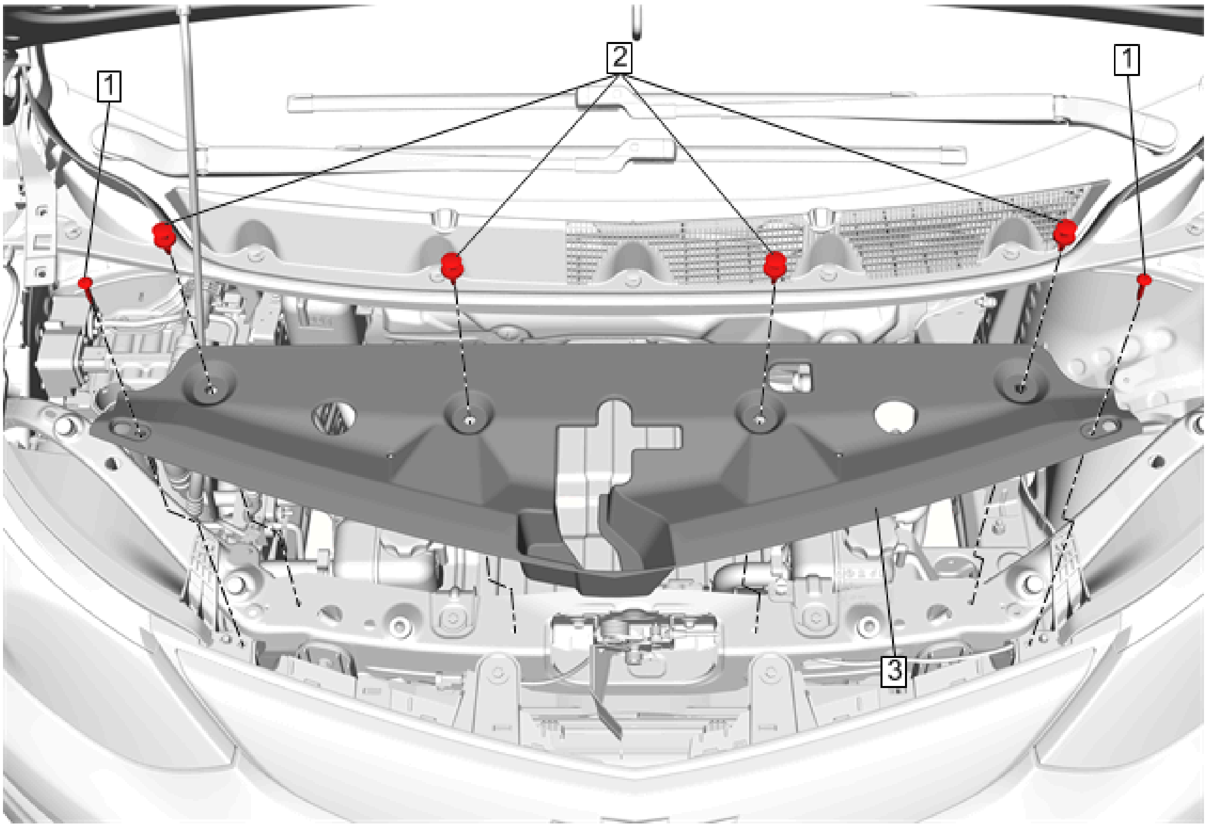

Fig. 64: Front Compartment Front Sight Shield
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
1	Front Compartment Front Sight Shield Bolt (Qty: 2) **CAUTION:** Fastener Caution **Tighten** 2.5 N.m (22 lb in)
2	Front Compartment Front Sight Shield Retainer (Qty: 4)
3	Front Compartment Front Sight Shield **Procedure** Release the four integral retainers.

LIFTGATE STRUT REPLACEMENT

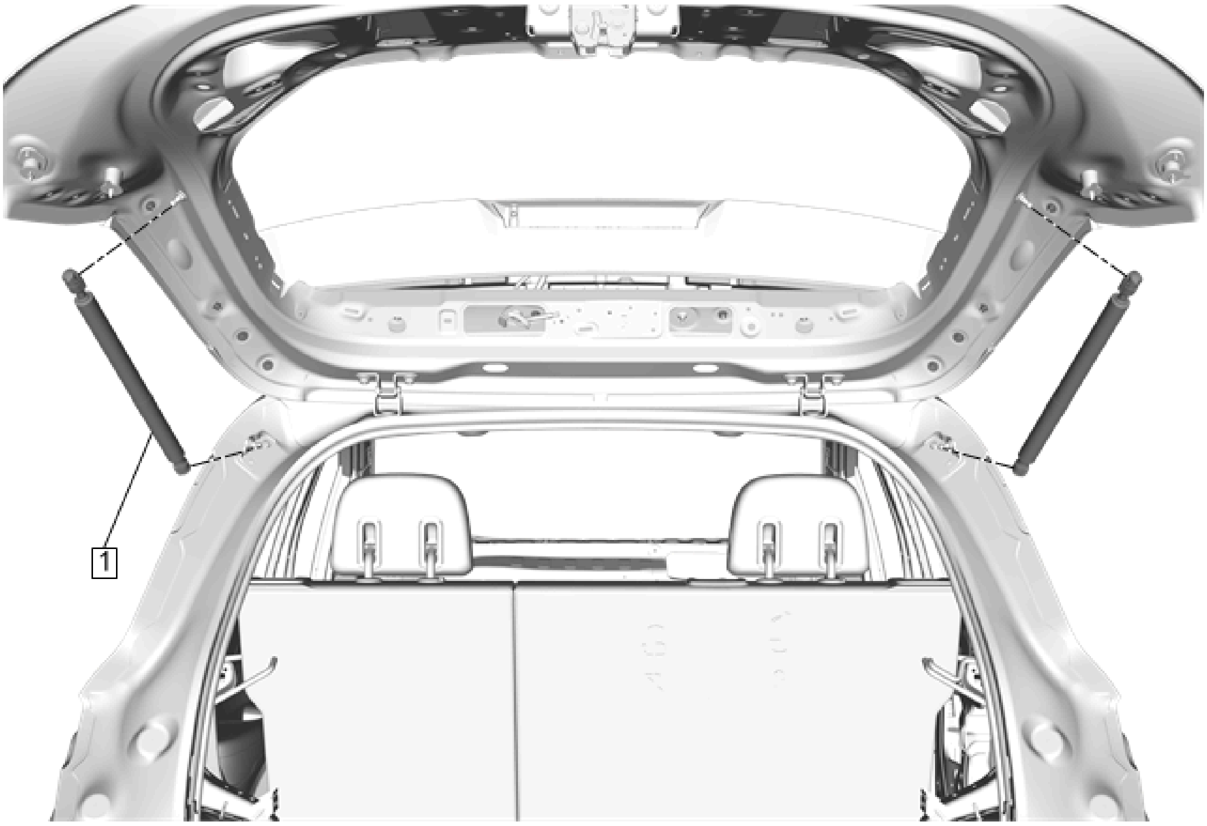

Fig. 65: Liftgate Strut
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
1	Liftgate Strut **WARNING:** **When a lift gate hold open device is being removed or installed, provide alternate support to avoid the possibility of damage to the vehicle or personal injury.** **CAUTION:** **Apply pressure only at the end of the liftgate/hood assist rod that you are removing or attaching. Do NOT apply pressure to the middle of the rod because damage or bending will result.** **Procedure** 1. Release the locking tabs on the strut. 2. Ensure the clip is fully seated when the strut is reinstalled. If the clip cannot be fully seated, a new strut should be installed. 3. Ensure the strut shaft is pointing toward the roof structure.

FRONT SIDE DOOR WEATHERSTRIP REPLACEMENT - DOOR SIDE

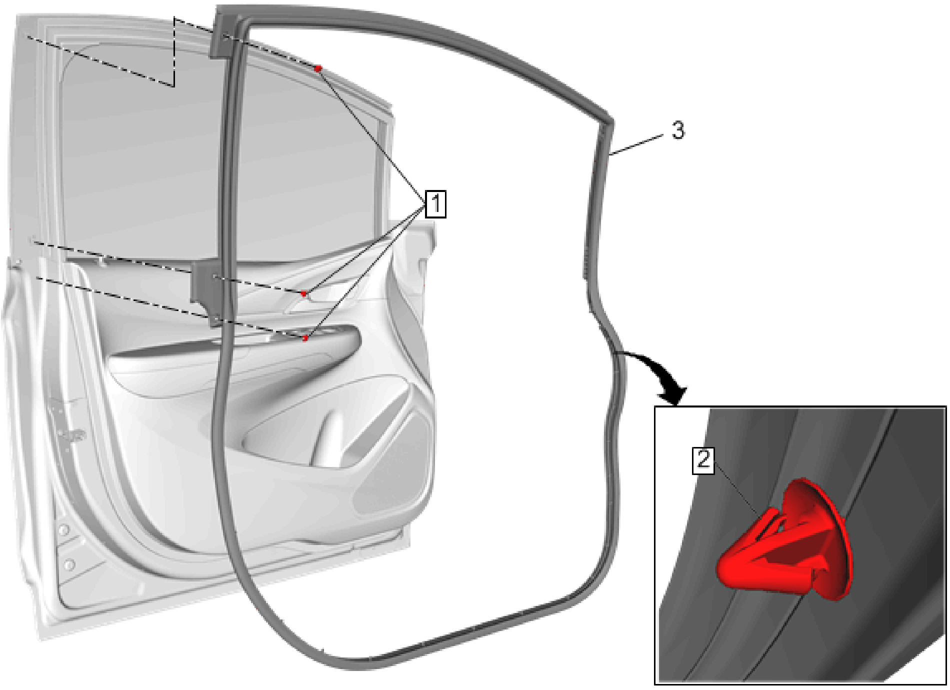

Fig. 66: Front Side Door Weatherstrip - Door Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Open the rear side door to the fully open position. 2. Remove the front side door check link bolt from the body side only. Front Side Door Check Link Replacement	
1	Front Side Door Weatherstrip Upper Retainer
2	Front Side Door Weatherstrip Retainer

Callout	Component Name
3	Front Side Door Weatherstrip - Door Side **Procedure** 1. Ensure that the weatherstrip is fully seated in the door frame retainer. 2. Verify proper door operation. **NOTE:** **Water test the door area after replacing the door weatherstrip to ensure no leaks.**

FRONT SIDE DOOR WEATHERSTRIP REPLACEMENT - BODY SIDE

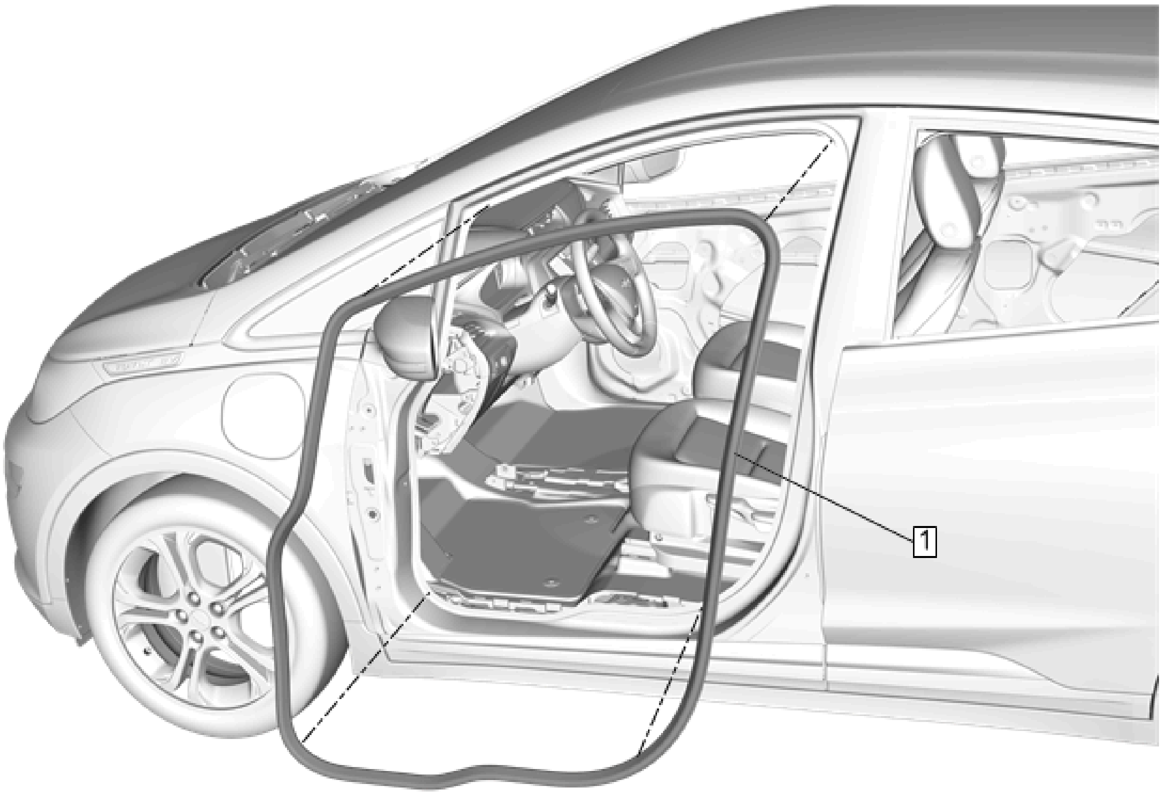

Fig. 67: Front Side Door Weatherstrip - Body Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Side Door Weatherstrip - Body Side **Procedure** 1. Ensure that the weatherstrip is fully seated on the flange. 2. Ensure that the weatherstrip is properly installed around the trim panel. 3. Verify proper door operation. **NOTE:** **Water test the door area after replacing the door weatherstrip to ensure no leaks.**

LIFTGATE WEATHERSTRIP REPLACEMENT

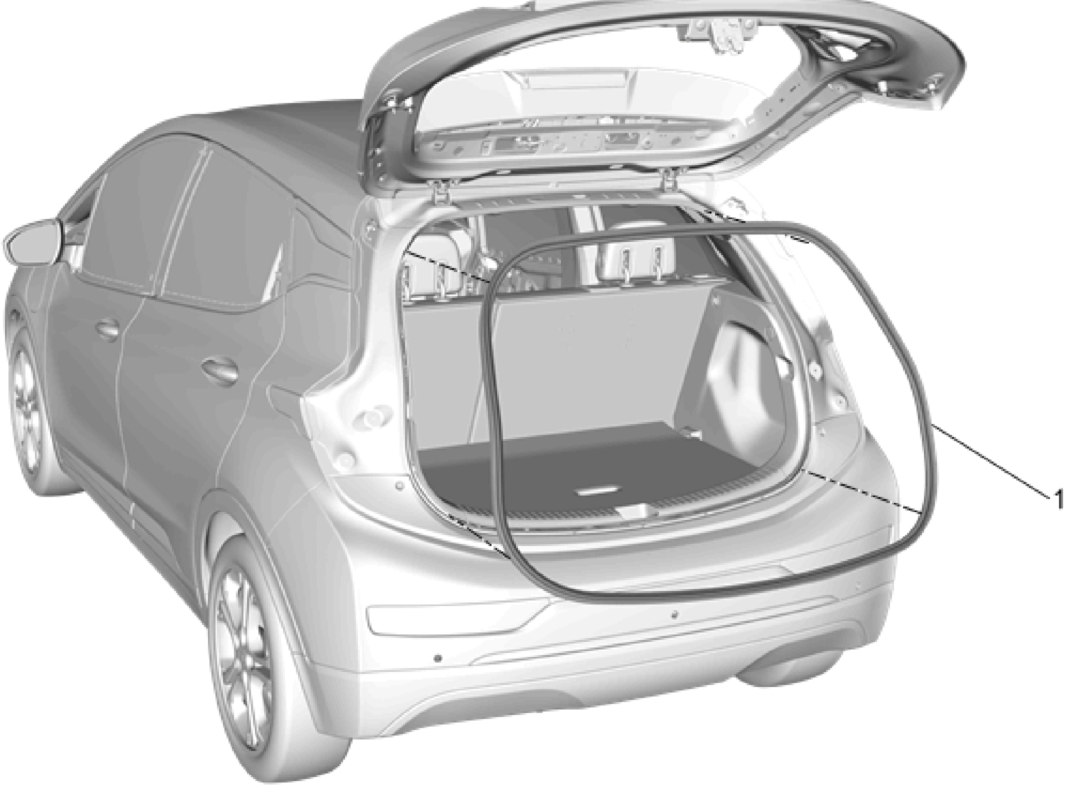

Fig. 68: Liftgate Weatherstrip
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Liftgate Window Weatherstrip **Procedure** 1. Start at the upper corner of the liftgate opening and pull the weatherstrip away from the liftgate opening flange. 2. Position the weatherstrip in the upper corner of the liftgate opening. 3. Working downward along the edge, install the weatherstrip on the liftgate opening flange ensuring that the carrier is fully seated in the corners. 4. Using a rubber mallet, ensure that the weatherstrip is seated on the entire liftgate opening flange.

REAR SIDE DOOR WEATHERSTRIP REPLACEMENT - DOOR SIDE

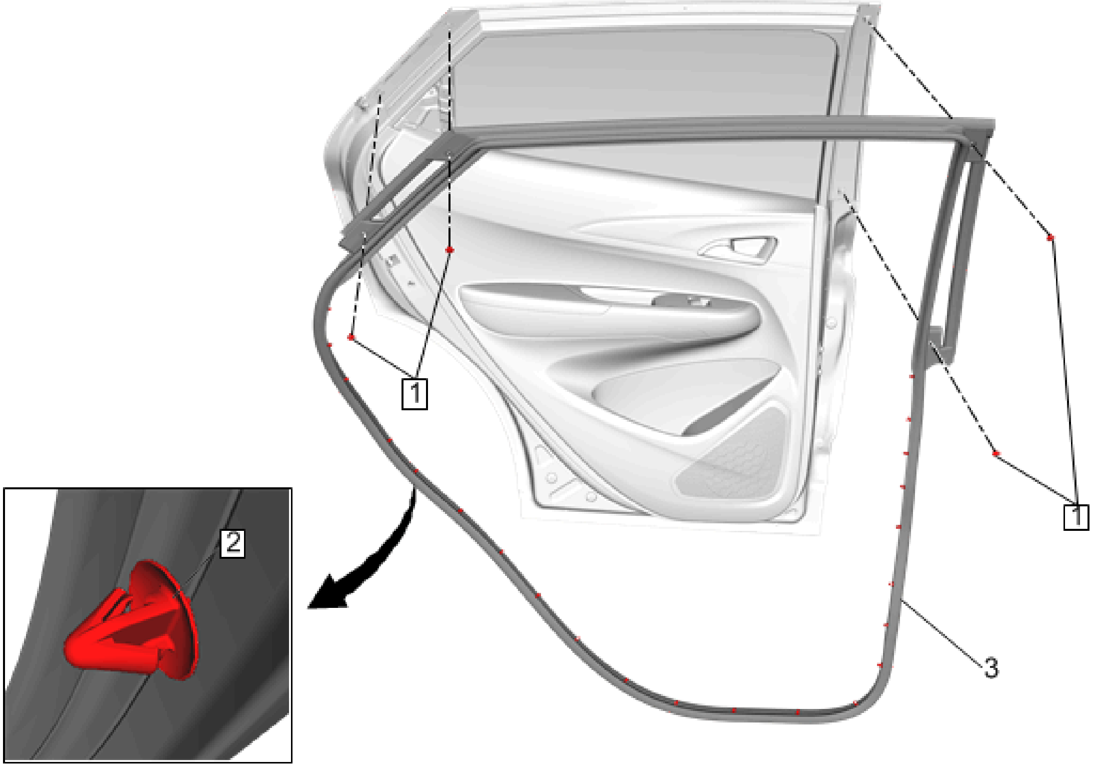

Fig. 69: Rear Side Door Weatherstrip - Door Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Open the rear side door to the fully open position. 2. Remove the rear side door check link bolt from the body side only. Rear Side Door Check Link Replacement	
1	Rear Side Door Weatherstrip Upper Retainer
2	Rear Side Door Weatherstrip Retainer
3	Rear Side Door Weatherstrip - Door Side **Procedure** 1. Ensure that the weatherstrip is fully seated in the door frame retainer. 2. Verify proper door operation. **NOTE:** **Water test the door area after replacing the door weatherstrip to ensure no leaks.**

REAR SIDE DOOR WEATHERSTRIP REPLACEMENT - BODY SIDE

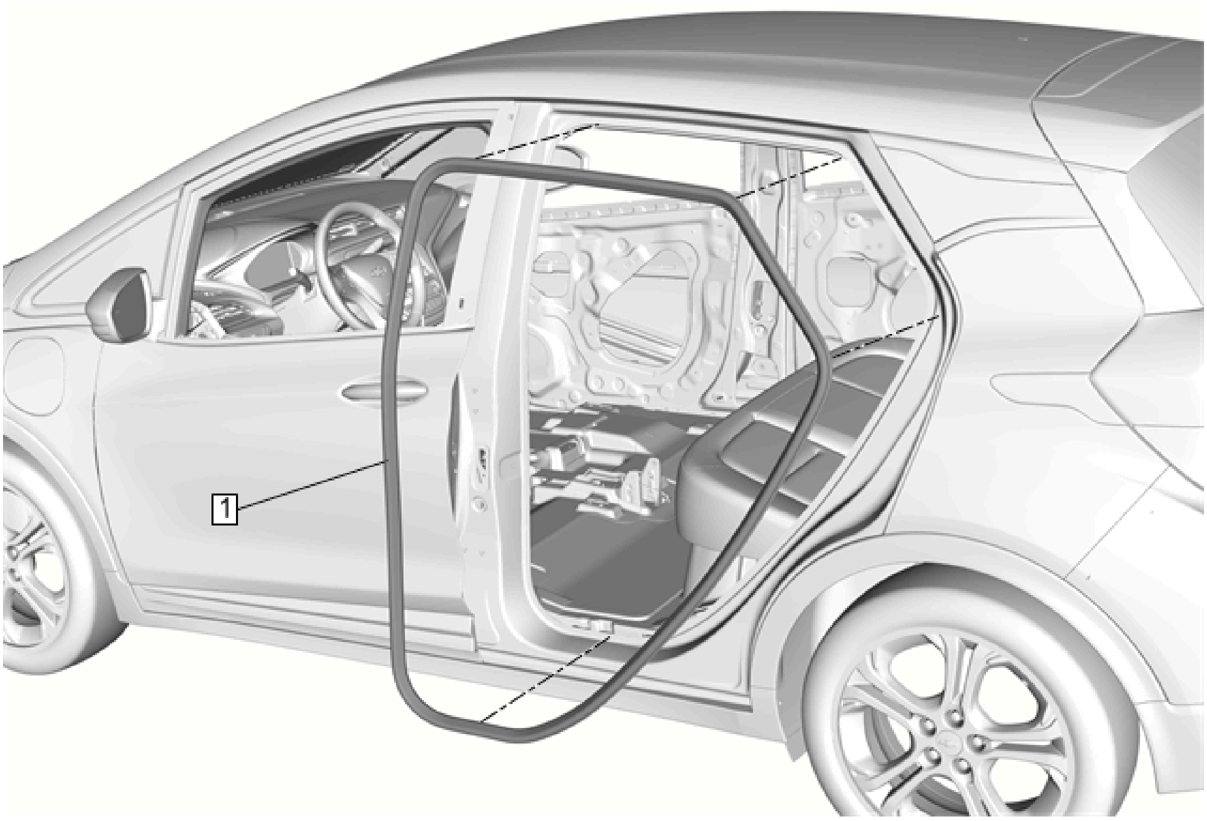

Fig. 70: Rear Side Door Weatherstrip - Body Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Side Door Weatherstrip - Body Side **Procedure** 1. Ensure that the weatherstrip is fully seated on the flange. 2. Ensure that the weatherstrip is properly installed around the trim panel. 3. Verify proper door operation. **NOTE:** **Water test the door area after replacing the door weatherstrip to ensure no leaks.**

DESCRIPTION AND OPERATION

HOOD AJAR INDICATOR DESCRIPTION AND OPERATION

Hood Ajar Switch

The body control module (BCM) applies B+ to the hood ajar signal circuit and monitors the voltage to determine the position of the hood. When the hood is closed, the switch is open and voltage remains high. When the hood is open, the switch is closed and the voltage is pulled low.

The BCM uses the hood ajar switch as a content theft deterrent alarm trigger.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P059F OR P151E: ACTIVE GRILLE AIR SHUTTER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P059F

Active Grille Air Shutter 1 Performance

DTC P151E

Active Grille Air Shutter Actuator 1 Signal Message Counter Incorrect

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P059F, P151E	P059F, P151E	- -	- -
Local Interconnect Network Serial Data Bus	U1510	U1510	U1510	U1510
Ground	-	P059F, P151E	-	- -

Circuit/System Description

The active grille air shutter actuator closes louvers at the front bumper to enhance vehicle aerodynamics in driving situations where cooling and A/C loads are relatively low and high levels of front end airflow are not required. If high levels of airflow are required the active grille air shutter actuator opens the louvers. The Local Interconnect Network (LIN) Serial Data Bus signal from the engine control module, ignition and ground circuits enable the active grille air shutter actuator to operate. If the conditions for opening the louvers are reached the engine control module commands the active grille air shutter actuator to open the louvers.

Conditions for Running the DTC

- Ignition On/Vehicle in Service Mode.
- The battery voltage is greater than 10 V.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

- The DTC P059F will be set during a key cycle when the commanded louver position can not be achieved after 5 attempts are made to move the louver. The DTC will be stored as current for this key cycle but the malfunction indicator lamp (MIL) will not be illuminated. The malfunction indicator lamp will illuminate in the second key cycle after a failed movement attempt is made in each of two back to back key cycles.
- The DTC P151E will set if there is a serial data communication failure.

Action Taken When the DTC Sets

DTC P059F and P151E are type B DTCs.

Conditions for Clearing the DTC

DTC P059F and P151E are type B DTCs.

- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition On/Vehicle in Service Mode.
2. Verify DTC U1510 is not set.
   - **If DTC U1510 is set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** for further diagnosis.

   - **If DTC U1510 is not set**

3. Verify the active grille air shutter position parameter changes from 0% (fully closed) to 100% (fully open) when using the scan tool ECM Active Grille Air Shutter Position control function.
   - **If the louvers at the front bumper do not open and close**

     Refer to Circuit/System Testing.

   - **If the louvers at the front bumper open and close**
4. Verify none of the following conditions are present:
   - Snow or ice packed in the front fascia which prevents the louvers from moving.
   - Debris or foreign objects which prevent the louvers from moving.
   - **If any of the conditions are present**

     Clear any snow, ice or foreign objects from the front grille.

   - **If none of the conditions are present**
5. All OK

Circuit/System Testing

1. Ignition/Vehicle Off and all vehicle systems Off, disconnect the harness connector(s) at the active grille air shutter actuator(s). It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit and ground.
   - **If 10 Ω or greater**
   1. Ignition/Vehicle Off.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition On/Vehicle in Service Mode.
4. Verify a test lamp illuminates between the ignition circuit and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle Off.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse. Refer to **Power Mode Mismatch** .
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle Off.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
   - **If the test lamp illuminates**
5. Ignition/Vehicle Off, disconnect the harness connector at the K20 Engine Control Module.
   1. Test for infinite resistance between the LIN Serial Data Bus circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   2. Test for less than 2 Ω in the LIN Serial Data Bus circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω
   3. Test for less than 1 V between the LIN Serial Data Bus circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
6. Test or replace the M60A Active Grille Air Shutter 1 Motor Module.

7. Verify DTCs P059F, P151E or U1510 are not set while operating the vehicle under the conditions for setting the DTC.
    - **If the DTC is set**

      Replace the K20 Engine Control Module.

    - **If the DTC is not set**
8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup.

SYMPTOMS - ACTIVE GRILLE AIR SHUTTER

NOTE: The following steps must be completed before using the symptom tables:

1. Perform the **Diagnostic System Check - Vehicle** before using the Symptom Tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Active Grille Air Shutter Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which may affect the operation of the system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which may cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Active Grille Air Shutter 1 Malfunction

ACTIVE GRILLE AIR SHUTTER 1 MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P059F

Active Grille Air Shutter 1 Performance

DTC P151E

Active Grille Air Shutter Actuator 1 Signal Message Counter Incorrect

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	P059F, P151E	P059F, P151E	- -	- -
Local Interconnect Network Serial Data Bus	U1510	U1510	U1510	U1510
Ground	-	P059F, P151E	-	- -

Circuit/System Description

The active grille air shutter actuator closes louvers at the front bumper to enhance vehicle aerodynamics in driving situations where cooling and A/C loads are relatively low and high levels of front end airflow are not required. If high levels of airflow are required the active grille air shutter actuator opens the louvers. The Local Interconnect Network (LIN) Serial Data Bus signal from the engine control module, ignition and ground circuits enable the active grille air shutter actuator to operate. If the conditions for opening the louvers are reached the engine control module commands the active grille air shutter actuator to open the louvers.

Conditions for Running the DTC

- Ignition On/Vehicle in Service Mode.
- The battery voltage is greater than 10 V.
- The DTC runs continuously when the above conditions are met.

Conditions for Setting the DTC

- The DTC P059F will be set during a key cycle when the commanded louver position can not be achieved after 5 attempts are made to move the louver. The DTC will be stored as current for this key cycle but the malfunction indicator lamp (MIL) will not be illuminated. The malfunction indicator lamp will illuminate in the second key cycle after a failed movement attempt is made in each of two back to back key cycles.
- The DTC P151E will set if there is a serial data communication failure.

Action Taken When the DTC Sets

DTC P059F and P151E are type B DTCs.

Conditions for Clearing the DTC

DTC P059F and P151E are type B DTCs.

Circuit/System Verification

1. Ignition On/Vehicle in Service Mode.
2. Verify DTC U1510 is not set.
   - **If DTC U1510 is set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle for further diagnosis.

   - **If DTC U1510 is not set**
3. Verify the active grille air shutter position parameter changes from 0% (fully closed) to 100% (fully open) when using the scan tool ECM Active Grille Air Shutter Position control function.
   - **If the louvers at the front bumper do not open and close**

     Refer to Circuit/System Testing.

   - **If the louvers at the front bumper open and close**
4. Verify none of the following conditions are present:
   - Snow or ice packed in the front fascia which prevents the louvers from moving.
   - Debris or foreign objects which prevent the louvers from moving.
   - **If any of the conditions are present**

     Clear any snow, ice or foreign objects from the front grille.

   - **If none of the conditions are present**
5. All OK

Circuit/System Testing

1. Ignition/Vehicle Off and all vehicle systems Off, disconnect the harness connector(s) at the active grille air shutter actuator(s). It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit and ground.
   - **If 10 Ω or greater**
   1. Ignition/Vehicle Off.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition On/Vehicle in Service Mode.
4. Verify a test lamp illuminates between the ignition circuit and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle Off.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse. Refer to Power Mode Mismatch .
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle Off.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
   - **If the test lamp illuminates**
5. Ignition/Vehicle Off, disconnect the harness connector at the K20 Engine Control Module.
   1. Test for infinite resistance between the LIN Serial Data Bus circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.

        - If infinite resistance

    2. Test for less than 2 Ω in the LIN Serial Data Bus circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω
    3. Test for less than 1 V between the LIN Serial Data Bus circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V

6. Test or replace the M60A Active Grille Air Shutter 1 Motor Module.
7. Verify DTCs P059F, P151E or U1510 are not set while operating the vehicle under the conditions for setting the DTC.
    - **If the DTC is set**

      Replace the K20 Engine Control Module.

    - **If the DTC is not set**
8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup.

DESCRIPTION AND OPERATION

ACTIVE GRILLE AIR SHUTTER DESCRIPTION AND OPERATION

The active grille air shutter system closes shutters in the front grille to enhance vehicle aerodynamics in driving situations where cooling and A/C loads are relatively low and high levels of front end airflow are not required. If high levels of airflow are required the active grille air shutter system will open one or both shutters. The control signal from the engine control module, ignition and ground circuits enable the active grille air shutter actuators to operate. If the conditions for opening the shutters are reached the engine control module commands the active grille air shutter actuators to open one or both shutters.

The dual active grille air shutter system consists of two aero shutter mechanisms located in the front grille for controlling the amount of air flowing through the grille. It includes three wires; ground, power and a Local Interconnect Network (LIN) Bus serial data circuit from the engine control module to the shutter actuator. The engine control module determines shutter state based on various vehicle conditions such as vehicle speed, coolant temperature, fan state, refrigerant system pressure, A/C compressor state and ambient temperature. The engine control module has the ability to command each shutter individually to the open or closed positions through communications on the LIN Bus.

The actuators are powered by an ignition circuit that is active when the key is in the RUN position. The vehicle may have to be driven for up to 13 minutes at speeds greater than 41 km/h (25 mph) before a shutter begins to move. If low ambient temperature is detected, the shutters will remain in the closed position.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B123E: RADIO KEYPAD BUTTON SIGNAL CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check - Vehicle
- Review the description of Strategy Based Diagnosis: Strategy Based Diagnosis
- An overview of each diagnostic category can be found here: Diagnostic Procedure Instructions

DTC Descriptor

DTC B123E

Radio Keypad Button Signal Circuit

Symptom Byte Information: Symptom Byte List

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal Terminal 6	B123E 02	B123E 01	B123E 01	-
Low Reference Terminal 10	-	B123E 01	-	-

Circuit/System Description

The radio controls communicate radio control inputs directly to the radio through a discrete circuit for volume up, volume down and power button. It also uses a series of resistors through a signal circuit when the home, seek up, seek down and phone buttons are pressed. After receiving the message the radio will perform the requested function. Messages communicated between the radio and the radio controls include the following:

- Button presses/knob rotations
- Commands for the state of indicators

- Controls back-lighting

Conditions for Running the DTC

- Vehicle in Service Mode/Ignition is ON or in the ACC position
- The system voltage is 9 - 16 V
- The infotainment system is ON
- The test is run once every 250 ms when the infotainment system is operating

Conditions for Setting the DTC

B123E 01

The radio detects an open/high resistance or short to voltage on the radio keypad button signal circuit

B123E 02

The radio detects a short to ground on the radio keypad button signal circuit

Actions Taken When the DTC Sets

Radio control buttons will be inoperative

Conditions for Clearing the DTC

The condition for setting the DTC is no longer detected for 250 ms.

- **Wiring Repairs**

Scan Tool Reference

Control Module References

Circuit/System Verification

1. Ignition On/vehicle in Service Mode.
2. Verify that each button on the A20 Radio/HVAC Controls operates normally by pressing each button individually.
    - **If none of the buttons operate normally**

      Refer to Circuit/System Testing

    - **If some, but not all, of the buttons operate normally**

      Test or replace the A20 Radio/HVAC Controls

   - **If all of the buttons operate normally**
3. All OK

Circuit/System Testing

1. Ignition OFF/vehicle OFF and all vehicle systems OFF. Disconnect the harness connector at the A20 Radio/HVAC Controls. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal 10 and ground.
   - **If 10 Ω of greater**
   1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the P17 Info Display Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the P17 Info Display Module
   - **If less than 10 Ω**
3. Ignition ON/vehicle in Service Mode.
4. Test for 2.5 - 3.5 V on the signal circuit terminal 6 and ground.
   - **If less than 2.5 V**
   1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the A11 Radio.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the A11 Radio.
   - **If greater than 3.5 V**
   1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the A11 Radio.
   2. Ignition ON/vehicle in Service Mode, test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the A11 radio.
   - **If between 2.5 - 3.5 V**
5. Test or replace the A20 Radio/HVAC Controls

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- For control module replacement, programming, and setup refer to: **Control Module References**

DTC B124B: USB 1 CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B124B

USB 1 Circuit

For symptom byte information refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	B124B, 1, 6	1, 5	-	-
Auxiliary Audio Common Signal	-	8	-	-
Auxiliary Detection Signal	7	8	-	-
Left Auxiliary Audio Signal	2	2	2, 4	-
Right Auxiliary Audio Signal	3	3	3, 4	-
USB Cable	B124B	B124B	B124B	-
Ground	-	1	-	-

1. USB port Inoperative
2. No left side audio from device connected to AUX jack
3. No right side audio from device connected to AUX jack
4. Noticeable distortion may be present in affected audio channel
5. Fault may affect one or more components, dependant on fault location
6. Fault affects multiple components, dependant on vehicle equipment
7. Radio does not detect auxiliary device connection, AUX not available as input selection
8. AUX always available as an input selection, with or without auxiliary device connected

Circuit/System Description

The infotainment system has a auxiliary jack and USB receptacle assembly. The auxiliary jack and USB receptacle assembly receives fused battery voltage and ground from the harness to power the internal hub device as well as providing additional amperage to power USB devices. The internal hub device interfaces directly with the radio via a standard USB cable.

Auxiliary Audio Input Jack

When a portable audio playback device is connected to the 3.5 mm (1/8 in.) auxiliary audio input jack an internal switch opens the detection signal circuit. The radio detects the device and AUX becomes available as an audio source. Audio signals from the device are sent to the radio from the auxiliary input jack via the left, right, and common audio signal circuits.

USB Port

The USB receptacle interfaces directly with the radio via a standard USB cable. A Mini type USB connector is used to connect the cable at the radio and at the auxiliary jack and USB receptacle assembly. USB male to female connections are typically used for connecting USB cables together where an in-line connection is required. An in-line cable connection is typically found between the console and I/P harness.

The USB port allows connectivity to the infotainment system from portable media players or a USB storage device (memory stick/flash drive). When a device is connected to the USB port, the system detects the device and USB becomes available as an audio source. Once connected, the device can be controlled from the radio controls.

Not all portable media player devices or file types are compatible. Refer to the owner's manual for information on USB devices, control, and operation.

Conditions for Running the DTC

- Ignition is ON or in the ACC position/vehicle in Service Mode
- The system voltage is 9-16 V
- The infotainment system is ON
- The test is run once per second when the infotainment system is operating

Conditions for Setting the DTC

The radio detects an excessive current condition on the USB 5 V circuit.

Action Taken When the DTC Sets

The USB port is inoperative while the DTC is current.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

This DTC may be set due to the connection of an incompatible or faulty USB device.

Scan Tool Reference

Control Module References for scan tool information

Special Tools

- **EL-50334-20** Multi-Media Interface Tester (MIT)
- **EL-50334-50** USB Cable and Adapter Kit
- **EL-50334-14** Infotainment Test Cable

Circuit/System Verification

1. Verify DTC B124B is not set. Since occurrences of this DTC can be caused by an incompatible or faulty USB device, review with the customer the conditions under which their concern occurred.
   - **If DTC B124B is set.**

     Refer to Circuit/System testing.

   - **If DTC B124B is not set.**
2. Ignition ON/vehicle in Service Mode, infotainment system ON.
3. Connect the EL-50334-20 Multi-Media Interface Tester (MIT) to the X83 Auxiliary Audio Input USB port and select the USB test mode.
4. Verify the audio from the EL-50334-20 Multi-Media Interface Tester (MIT) is heard through the infotainment system while operating the system to play audio from the test tool.
   - **If audio is not heard from the test tool**

     Refer to Circuit/System Testing.

   - **If audio is heard from the test tool**
5. All OK.

Circuit/System Testing

1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the X83 Auxiliary Audio Input.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.

    - **If 10 Ω or greater**
    1. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Verify that a test lamp illuminates between the B+ circuit terminal 6 and ground.
    - **If the test lamp does not illuminate**
    1. Remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - **If the test lamp illuminates**
4. Verify the USB cable is properly connected at all components and any in-line connections, and there is no damage to the cable or connections.
    - **If connection problems or cable damage is noted.**

      Perform the appropriate repair or replacement to correct any issues.

    - **If no connection problems or cable damage is noted.**
5. Disconnect the vehicle USB cable at the A11 Radio and the X83 Auxiliary Audio Input.
6. Connect the EL-50334-14 Infotainment Test Cable and the EL-50334-2 Type-A Female to Mini-B Male Cable together. Connect the assembled test cable to the A11 Radio and the X83 Auxiliary Audio Input.
7. Ignition ON/vehicle in Service Mode, infotainment system ON.
8. Connect the EL-50334-20 Multi-Media Interface Tester (MIT) to the X83 Auxiliary Audio Input USB port and select the USB test mode.
9. Verify the audio from the EL-50334-20 Multi-Media Interface Tester (MIT) is heard through the infotainment system while operating the system to play audio from the test tool.
    - **If audio is not heard from the test tool**
    1. Replace the X83 Auxiliary Audio Input. Connect all harness connectors.
    2. Connect the EL-50334-20 Multi-Media Interface Tester (MIT) to the X83 Auxiliary Audio Input USB port and select the USB test mode.
    3. Verify the audio from the EL-50334-20 Multi-Media Interface Tester (MIT) is heard through the infotainment system while operating the system to play audio from the test tool.
        - If audio is not heard from the test tool, replace the A11 Radio.
        - If audio is heard from the test tool.
    4. All OK.
    - **If audio is heard from the test tool**
10. Replace the USB cable assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Audio Disc Player and USB Receptacle Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

DTC B124F: UNIVERSAL SERIAL BUS (USB) PROGRAMMING

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B124F

Universal Serial Bus (USB) Programming

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Certain devices in the entertainment system must be programmed with specific software and other information to operate correctly. This DTC is the result of an unsuccessful USB programming event of the device. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved

Conditions for Running the DTC

Once upon each USB Programming Event.

Conditions for Setting the DTC

The programming event was incomplete, or completed with errors.

Action Taken When the DTC Sets

The entertainment system has limited or no functionality.

Conditions for Clearing the DTC

The programming event completes successfully.

Diagnostic Aids

DTC B124F could set if a programming attempt was made when the module already had the latest update available installed.

Circuit/System Verification

1. Ignition ON/vehicle in Service Mode.
2. Verify DTC B124F is not set.
   - **If DTC B124F is set**
   1. Program the device that set the DTC.
   2. Verify the DTC does not set.
      - If DTC is set, replace the device that set the DTC.
      - If the DTC is not set
   3. All OK.
   - **If DTC B124F is not set**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for device replacement, programming, and setup.

DTC B125A: ANTENNA SIGNAL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B125A 02

Antenna Signal Circuit Short to Ground

DTC B125A 04

Antenna Signal Circuit Open Circuit

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Radio Antenna Coax	B125A 02	B125A 04	1	-
Antenna Module Ground	-	1	-	-
1. May exhibit possible AM/FM interference.				

Circuit/System Description

The antenna amplifier receives both AM and FM signals from the rear glass antenna. The radio antenna amplifier is enabled when the radio is turned on. The radio provides battery voltage to the antenna amplifier using the center conductor of the antenna coaxial cable. When a 12 V signal is seen by the amplifier on the center conductor of the antenna coax, both AM and FM signals are amplified.

Conditions for Running the DTC

- Ignition ON.
- Battery voltage must be between 9 - 16 V.

Conditions for Setting the DTC

B125A 02

The radio detects a short to ground in the antenna signal circuit center conductor.

B125A 04

The radio detects an open in the antenna signal circuit center conductor.

Action Taken When the DTC Sets

Radio reception may be poor or not available.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clears after 50 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

Poor AM and FM radio reception may be due to multiple influences, some of which may not be vehicle related. Areas which have high RF traffic or block the signal path may cause a degradation in radio reception. Radio reception may also be influenced by items within the vehicle, but not part of the radio system. Such examples are aftermarket electrical accessories or other items which may generate noise in the vehicle electrical system. Aftermarket window tinting, especially when there is a metallic in the film, may reduce radio reception.

AM reception is highly dependent on the antenna amplifier receiving battery voltage from the radio and being properly grounded. The antenna amplifier boosts both AM and FM reception. When the antenna amplifier does not receive power, AM stations may not be received and FM reception will be limited. If the amplifier is not properly grounded, excessive interference in the signal may occur, or reception may be limited.

Description and Operation

Radio/Audio System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, disconnect the radio antenna coax cable from the A11 Radio and from the T23 Radio Antenna Amplifier.
2. Verify the antenna coax cable passes the coax cable component test. Refer to Component Testing.
    - **If the coax cable does not pass the test**

      Replace the antenna coax cable

    - **If the coax cable passes the test**
3. Connect the antenna coax cable to the A11 Radio. Ignition ON, A11 Radio ON.
4. Verify a test lamp illuminates between the antenna coax cable center terminal and ground at the T23 Radio Antenna Amplifier connector.
    - **If the test lamp does not illuminate**

      Replace the A11 Radio.

    - **If the test lamp illuminates**
5. Test or replace the T23 Radio Antenna Amplifier.

Component Testing

CAUTION: **Refer to Test Probe Caution .**

NOTE: **Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.**

To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.
2. Test for less than 5 Ω between coax cable center terminal end to end.
    - **If 5 Ω or greater**

      Replace the coax cable

    - **If less than 5 Ω**
3. Test for less than 5 Ω between the coax cable outer shield end to end.
    - **If 5 Ω or greater**

      Replace the coax cable

    - **If less than 5 Ω**

4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
    - **If less than infinite resistance**

      Replace the coax cable

    - **If infinite resistance**
5. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Radio Antenna Amplifier Replacement**
- Refer to **Control Module References** for radio replacement, programming, and setup.

DTC B125C: SATELLITE ANTENNA CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B125C 01

Satellite Antenna Circuit Short to Battery

DTC B125C 02

Satellite Antenna Circuit Short to Ground

DTC B125C 04

Satellite Antenna Circuit Open

Circuit/System Description

The digital radio receiver, located inside the radio, receives digital radio information from the digital radio antenna located on the outside of the vehicle. The digital radio receiver is connected to the digital radio antenna via a shielded coax cable. The digital radio antenna contains an amplifier which is powered by the radio through the coax cable.

Conditions for Running the DTC

This DTC is run every 300 milliseconds.

Conditions for Setting the DTC

The radio detects a circuit fault in the digital radio antenna.

Action Taken When the DTC Sets

The radio displays No XM Signal or Check Antenna.

Conditions for Clearing the DTC

- A current DTC clears when the condition for setting the DTC is no longer present.
- A history DTC clears after 100 malfunction-free ignition cycles.

Diagnostic Aids

The digital radio antenna requires a clear line of sight to the sky to operate properly. Reception may be limited, intermittent, or unavailable inside structures.

Description and Operation

Radio/Audio System Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Special Tools

EL-48028 Digital Radio Test Antenna

Circuit/System Verification

1. With the vehicle outside in an area with an unobstructed view of the southern sky, tune to XM.
2. Verify DTC B125C is not set as current and the No XM Signal message is not displayed on the radio.
   - **If DTC B125C is set as current or the No XM Signal message is displayed.**

     Refer to Circuit/System Testing.

   - **If DTC B125C is not set as current and the No XM Signal message is not displayed.**
3. All OK.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, disconnect the digital radio antenna coax cable from the A11 Radio. Connect the **EL-48028** Digital Radio Test Antenna to the radio and place on the roof of the vehicle.
2. Ignition ON/Vehicle in Service Mode, radio tuned to XM channel 1.
3. Verify DTC B125C is not set as current and XM reception is improved.
   - **If DTC B125C is set as current or XM reception is not improved**

     Replace the A11 Radio.

   - **If DTC B125C is not set as current and XM reception is improved**
4. Ignition OFF/Vehicle OFF, disconnect the digital radio antenna coax cable from the T2RR Antenna - Roof Rear.
5. Verify the digital radio antenna coax cable passes the coax cable component test. Refer to Component Testing.
   - **If the coax cable does not pass the test**

     Replace the antenna coax cable

   - **If the coax cable passes the test**
6. Test or replace the T2RR Antenna - Roof Rear.

Component Testing

CAUTION: **Refer to Test Probe Caution .**

NOTE: **Before testing the coax cable, check the cable exterior for being pinched, cut,**

damaged, or having loose connections at the components, which can cause reception issues.

To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF/Vehicle OFF, disconnect the coax cable at both components.
2. Test for less than 5 Ω between coax cable center terminal end to end.
   - **If 5 Ω or greater**

     Replace the coax cable

   - **If less than 5 Ω**
3. Test for less than 5 Ω between the coax cable outer shield end to end.
   - **If 5 Ω or greater**

     Replace the coax cable

   - **If less than 5 Ω**
4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
   - **If less than infinite resistance**

     Replace the coax cable

   - **If infinite resistance**
5. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to High Frequency Antenna Replacement
- Refer to Control Module References for radio replacement, programming, and setup.

DTC B1265: SWITCHED 14 VOLT PERFORMANCE SHORT TO GROUND

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC B1265 02

Switched 14 Volt Performance Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Remote Enable	DTC B1265 02 *	1	2	-
* all components requiring remote enable inoperative 1. fault may affect one or more components, dependant on fault location and vehicle equipment 2. components will not power off with infotainment system				

Circuit/System Description

When the radio is on, a discrete 12 V signal is supplied on the entertainment remote enable circuit to the audio amplifier. This signal is used to control the power state of the component.

Conditions for Running the DTC

- The radio is ON.
- The system voltage is 9 - 16 V

Conditions for Setting the DTC

- The radio detects a short to ground on the entertainment remote enable circuit.
- The above condition is present for greater than 250 mS.

Action Taken When the DTC Sets

- The radio implements a current limiting mode and disables the output on the entertainment remote enable circuit.
- All components connected on the entertainment remote enable circuit will be inoperative.

Conditions for Clearing the DTC

- The condition for setting the DTC no longer exists.
- After the ignition has been OFF for a sufficient amount of time to allow the radio to enter a low power/sleep state, the radio will re-enable the output on the following ignition cycle and the DTC will become history.
- A history DTC clears after 50 malfunction-free ignition cycles.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the radio/infotainment systems.
- The radio's current limiting logic may not re-enable the output on the entertainment remote enable circuit until after the radio performs a full power - down. It may be necessary to wait 5 minutes between each test attempt with the key OFF and retained accessory power OFF.

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF, radio OFF, remove the radio B+ fuse.
2. Disconnect the X3 harness connector at the T3 Audio Amplifier.
3. Install the radio B+ fuse. Ignition ON, A11 Radio ON.

4. Verify that a test lamp illuminates between the control circuit terminal 8 and ground:
    - **If the test lamp does not illuminate.**
    1. Ignition OFF. Disconnect the X1 harness at the A11 Radio.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance.
    3. Test for less than 2 Ω in the control circuit end to end.
        - If greater than 2 Ω, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the A11 Radio.
    - **If the test lamp illuminates.**
5. Ignition OFF. Connect the X3 harness connector at the T3 Audio Amplifier.
6. Ignition ON, A11 Radio ON.
7. Verify that DTC B1265 is NOT set.
    - **If DTC B1265 is set.**

      Replace the T3 Audio Amplifier.

    - **If DTC B1265 is not set.**
8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for radio and amplifier replacement, programming, and setup

DTC B1271: THEFT PROTECTION ACTIVE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B1271 00

Theft Protection Active

Circuit/System Description

When the radio is initially installed in the vehicle, the radio receives VIN information via serial data. The radio stores a portion of the VIN and compares this sequence to the VIN information received each time the radio powers on. The VIN in the radio is a single one-time learn.

The radio theft deterrent system is intended to disable or limit radio functionality if incorrect vehicle information is received by the radio. The radio disables functionality if the VIN information received by the radio does not match the VIN information that has been learned by the radio. This DTC is generated by the module when the Theft Protection is activated.

Conditions for Running the DTC

This DTC test runs when the radio changes from OFF to ON.

Conditions for Setting the DTC

The radio has learned a correct VIN sequence and the VIN information received via serial data does NOT match the learned VIN sequence.

Action Taken When the DTC Sets

The radio may be disabled or have limited functionality. The radio display will indicate that theft protection is active.

Conditions for Clearing the DTC

The radio receives the correct VIN information via serial data.

Diagnostic Aids

A possible cause of incorrect VIN info could be the radio was originally installed in another vehicle.

    - **If DTC B1271 is not set**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for radio replacement, programming, and setup.

DTC B1277: CELLULAR PHONE MICROPHONE CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B1277 02

Cellular Phone Microphone Circuit Short to Ground

DTC B1277 04

Cellular Phone Microphone Circuit Open/High Resistance

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	B1277 02	B1277 04	B1277 04	-
Low Reference	B1277 02	B1277 04	B1277 04	-

Circuit/System Description

The radio provides the cellular phone microphone with a supplied voltage on the cellular phone microphone high signal circuit. When the microphone is in use, voice data from the user is sent back to the radio on the cellular microphone low signal circuit.

Conditions for Running the DTC

- The ignition must be in the RUN or ACC position/vehicle in Service Mode.
- The system voltage is at least 9.5 V and no more than 15.5 V.
- All the above conditions are present for greater than 10 s.

Conditions for Setting the DTC

B1277 02

The radio detects a short to ground in the cellular phone microphone high signal circuit for 10 s or greater.

B1277 04

The following conditions will set this DTC:

- The radio detects an open/high resistance in the cellular phone microphone high signal circuit for 10 s or greater.
- The radio detects an open/high resistance in the microphone low signal circuit for 10 s or greater.

Action Taken When the DTC Sets

- The radio will not receive a signal from the cellular phone microphone.
- Calls can be placed but the caller cannot be heard.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF/vehicle OFF, disconnect the harness connector at the B24 Cellular Phone Microphone, ignition ON/vehicle in Service Mode.
2. Test for 9-11 V between the signal circuit terminal B and ground.
    - **If less than 9 V**
    1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the A11 Radio.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the A11 Radio.
    - **If greater than 11 V**
    1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the A11 Radio.
    2. Ignition ON/vehicle in Service Mode, test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the A11 Radio.
    - **If between 9-11 V**
3. Test for less than 1 V between the low reference circuit terminal A and ground.
    - **If greater than 1 V**
    1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the A11 Radio.
    2. Ignition ON/vehicle in Service Mode, test for less than 1 V between the low reference circuit and ground.
        - If 1 V or greater, repair the short to voltage in the circuit.
        - If less than 1 V, replace the A11 Radio
    - **If less than 1 V**
4. Test for greater than 9 V between the signal circuit terminal B and the low reference circuit terminal A.
    - **If less than 9 V**
    1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the A11 Radio.
    2. Test for infinite resistance between the low reference circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the A11 Radio.
    - **If greater than 9 V**
5. Test or replace the B24 Cellular Phone Microphone.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Mobile Telephone Microphone Replacement
- Refer to Control Module References for telematics communication interface control module replacement, programming and setup.

DTC B127E: FRONT VIDEO DISPLAY OUTPUT SIGNAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B127 00

Front Video Display Output Signal Malfunction

DTC B127 01

Front Video Display Output Signal Short to Battery

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Radio Display LVDS Lock Signal	B127E 00	-	-	-
Radio Display LVDS Error Signal	B127E 00	-	-	-
LVDS cable	B127E 00	B127E 00	B127E 01	-

Circuit/System Description

The infotainment display and controls are separate components from the radio. The components are supplied battery voltage and ground from the vehicle harness. The radio communicates digital video data for on-screen display through a dedicated cable containing the LVDS data circuits.

If the radio detects the display is not responding to the output on the LVDS circuits, the radio sets the DTC.

Conditions for Running the DTC

- Ignition is ON or in the ACC position
- The system voltage is 9-16 V
- The infotainment system is ON
- The test is run once every 14 ms when the infotainment system is operating

Conditions for Setting the DTC

The radio detects the display is not responding to the output on the LVDS circuits.

Action Taken When the DTC Sets

- The radio sets this DTC
- No images are shown on the info display module

Conditions for Clearing the DTC

- The radio detects a properly synced digital video signal.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

- EL-50334-2 Type A female to Mini B male USB Cable
- EL-50334-14 Infotainment Test Cable

Circuit/System Testing

1. Vehicle OFF/Ignition OFF, disconnect the X1 harness connector at the P17 Info Display Module
2. Test for infinite resistance between the signal circuits listed below and ground:
    - Radio display LVDS lock signal circuit terminal 5
    - Radio display LVDS error signal circuit terminal 6
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
3. Reconnect the X1 harness connector at the P17 Info Display Module.
4. Disconnect the LVDS interface cable from the P17 Info Display Module.
5. Connect the EL-50334-2 Type A female to Mini B male USB Cable to the P17 Info Display Module. Connect the EL-50334-14 Infotainment Test Cable to the adapter.
6. Disconnect the LVDS interface cable from the A11 Radio. Connect the EL-50334-14 Infotainment Test cable to the A11 Radio.
7. Ignition ON/Vehicle in Service Mode, infotainment system ON.
8. Verify DTC B127E is not set as current.
    - **If DTC B127E is set as current**
    1. Replace the P17 Info Display Module. Connect all harness connectors.
    2. Ignition ON, infotainment system ON.
    3. Verify DTC B127E is not set as current.
        - If DTC B127E is still set as current, replace the A11 Radio.
        - If DTC B127E is not set.
    4. All OK.
    - **If DTC B127E is not set as current.**
9. Replace the vehicle LVDS interface cable from the P17 Info Display Module to the A11 Radio.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Control Module References for replacement, programming, and setup.

DTC B1287: AMPLIFIER CONTROL SIGNAL CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.

- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptors

DTC B1287 01

Amplifier Control Signal Circuit Short to Battery

DTC B1287 02

Amplifier Control Signal Circuit Short to Ground

DTC B1287 04

Amplifier Control Signal Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Amplifier Control	B1287 02	B1287 04	B1287 01*	-
* No audio output.				

Circuit/System Description

The radio amplifier control circuit provides varying pulse width modulated (PWM) signals to control overall muting of the amplifier. The PWM signals are varying duty cycle percentages ranging from 0 - 100 percent. A low duty cycle unmutes all amplifier channels and a high duty cycle mutes all amplifier channels. The amplifier control circuit will measure less than 1 V when the mute function is OFF, and approximately 8 V when at full mute. The radio monitors the amp control circuit for faults.

Conditions for Running the DTC

- The radio is on.
- The system voltage is 9 - 16 V.
- The radio performs the test once during wakeup.

Conditions for Setting the DTC

The radio detects a fault on the amplifier control circuit 400 ms after radio activates the remote enable circuit.

Action Taken When the DTC Sets

Radio sets the DTC and continues to output correct state.

Conditions for Clearing the DTC

- The condition must no longer be present.
- A history DTC clears after 50 malfunction-free ignition cycles.

Circuit/System Testing

NOTE: **To prevent misdiagnosis, the door chime must be OFF during testing. Ensure the driver door latch is closed during testing.**

1. Ignition OFF/vehicle OFF, disconnect the X3 harness connector at the T3 Amplifier. Ignition ON/vehicle in Service Mode, A11 Radio ON, mute ON.
2. Test for 7.5 - 8.5 V between the control circuit terminal 11 and ground.
    - **If greater than 8.5 V**
    1. Ignition OFF/vehicle OFF, disconnect the X2 harness connector at the A11 Radio. Ignition ON/vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the A11 Radio.
    - **If less than 7.5 V**
    1. Ignition OFF/vehicle OFF, disconnect the X2 harness connector at the A11 Radio.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the A11 Radio.
    - **If between 7.5 - 8.5 V**
3. A11 Radio ON, mute OFF.
4. Test for less than 1 V between the control circuit terminal 11 and ground.
    - **If 1 V or greater**

      Replace the A11 Radio.

    - **If less than 1 V**
5. Test or replace the T3 Amplifier.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for radio and amplifier replacement, programming, and setup.

DTC B1446 OR B1447: BACKUP POWER SOURCE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptors

DTC B1446

Replace Backup Power Source Below Minimum Threshold

DTC B1447

Backup Power Source Open Circuit

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Backup Battery B+	B1447 03	B1447 04	-	-
Backup Battery Low Reference	B1447 03	B1447 04	-	-

Circuit/System Description

The backup power source provides voltage to the telematics communication interface control module, to be able to successfully place a call in the event of a main battery disconnect during a collision event.

Conditions for Running the DTC

B1446 03

- Ignition On/Vehicle in Service Mode.
- System voltage is between 9.5 and 15.5 V.
- DTC B1447 is not set.

B1447 04

- Ignition On/Vehicle in Service Mode.
- System voltage is between 9.5 and 15.5 V.
- The above conditions are present for greater than 10 s.

Conditions for Setting the DTC

B1446 03

The telematics communication interface control module detects that the backup power source voltage has dropped below the minimum threshold value.

B1447 04

The telematics communication interface control module detects no voltage from the backup power source.

Action Taken When the DTC Sets

B1446 03

The OnStarÃ‚Â® status LED turns red.

B1447 04

- The OnStarÃ‚Â® status LED turns red.
- The telematics communication interface control module will be unable to place a call in the event of a main battery disconnect during a collision event.

Conditions for Clearing the DTC

- A current DTC B1446 will clear when the telematics communication interface control module detects the voltage of the backup power source is above the minimum threshold value.
- A current DTC B1447 will clear when the telematics communication interface control module detects voltage from the backup power source.
- A history DTC clears after 50 malfunction-free ignition cycles.

Diagnostic Aids

- Shorting the backup power source positive voltage circuit to the backup power source ground circuit or chassis ground will activate the internal circuit protection of the backup power source, rendering the backup power source inoperative.
- DTC B1447 may set if the K73 Telematics Communication Interface Control Module has been incorrectly disconnected or serviced. When disconnecting the K73 Telematics Communication Interface Control Module, disconnect the harness connector X1 at the K73 Telematics Communication Interface Control Module prior to disconnecting any other harness connectors. This will ensure the backup power source is preserved when voltage is removed from the K73 Telematics Communication Interface Control Module.

- **Connector Repairs**

Circuit/System Testing

1. Ignition OFF/Vehicle OFF and all vehicle systems OFF, disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for greater than 12.3 V between the B+ circuit terminal 14 and the low reference circuit terminal 13.
    - **If 12.3 V or less**
    1. Disconnect the C3 Telematics Communication Interface Control Module Battery.
    2. Test for infinite resistance between the circuits listed below and ground.
        - B+ circuit terminal 14
        - Low reference circuit terminal 13.
            - If less than infinite resistance, repair the short to ground in the circuit.
            - If infinite resistance.
    3. Test for less than 2 Ω in the circuits end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the C3 Telematics Communication Interface Control Module Battery.
    - **If greater than 12.3 V**
3. Replace the K73 Telematics Communication Interface Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Communication Interface Module Battery Replacement**
- Refer to **Control Module References** for telematics communication interface control module replacement, programming and setup.

DTC B2455: CELLULAR PHONE MICROPHONE CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B2455 02

Cellular Phone Microphone Circuit Short to Ground

DTC B2455 04

Cellular Phone Microphone Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Microphone Signal	B2455 02	B2455 04	B2455 04	-
Microphone Low Signal	B2455 02	B2455 04	B2455 04	-

Circuit/System Description

The telematics communication interface control module provides the cellular phone microphone with a supplied voltage on the cellular phone microphone high signal circuit. When the microphone is in use, voice data from the user is sent back to the telematics communication interface control module on the microphone low signal circuit.

Conditions for Running the DTC

- The Vehicle must be ON or in Service Mode.
- The system voltage is at least 9.5 V and no more than 15.5 V.
- All the above conditions are present for greater than 10 s.

Conditions for Setting the DTC

B2455 02

The telematics communication interface control module detects a short to ground in the cellular phone microphone signal circuit for 10 s or greater.

B2455 04

The following conditions will set this DTC:

- The telematics communication interface control module detects an open/high resistance in the cellular phone microphone signal circuit for 10 s or greater.
- The telematics communication interface control module detects an open/high resistance in the low signal circuit for 10 s or greater.

Action Taken When the DTC Sets

- The OnStarÃ‚Â® status LED turns red.
- The telematics communication interface control module will not receive a signal from the cellular phone microphone.
- Calls can be placed but the caller cannot be heard.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, disconnect the harness connector at the B24 cellular phone microphone, Ignition ON/Vehicle in Service Mode.
2. Test for 8.0-10.5 V between the signal circuit terminal B and ground.
   - **If less than 8.0 V**
   1. Ignition OFF/Vehicle OFF, disconnect the X2 harness connector at the K73 telematics communication interface control module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground in the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the vehicle K73 Telematics Communication Interface Control Module.
   - **If greater than 10.5 V**
   1. Ignition OFF/Vehicle OFF, disconnect the X2 harness connector at the K73 telematics communication interface control module, Ignition ON/Vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
   - **If between 9.5-10.5 V**
3. Test for less than 1 V between the signal circuit terminal A and ground.
   - **If greater than 1 V**
   1. Ignition OFF/Vehicle OFF, disconnect the X2 harness connector at the K73 telematics communication interface control module, Ignition ON/Vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage in the circuit.
      - If less than 1 V, repair the K73 Telematics Communication Interface Control Module.
   - **If less than 1 V**
4. Test for greater than 8 V between the signal circuit terminal B and the signal circuit terminal A.
   - **If less than 8 V**
   1. Ignition OFF/Vehicle OFF, disconnect the connector X2 at the K73 telematics communication interface control module.

2. Test for infinite resistance between the low signal circuit and ground.
    - If less than infinite resistance, repair the short to ground in the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the signal circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the vehicle K73 Telematics Communication Interface Control Module.

- **If greater than 8 V**

5. Test or replace the B24 Cellular Phone Microphone.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Mobile Telephone Microphone Replacement**
- Refer to **Control Module References** for telematics communication interface control module replacement, programming and setup.

DTC B2462: GLOBAL POSITIONING SYSTEM (GPS) SIGNAL

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B2462 02

Global Positioning System (GPS) Signal Short to Ground

DTC B2462 04

Global Positioning System (GPS) Signal Open Circuit

Circuit/System Description

The Telematics Communication Interface Control Module receives information from the GPS antenna located on the outside of the vehicle. The GPS antenna is connected to the Telematics Communication Interface Control Module via a shielded coaxial cable. The telematics communication interface control module supplies 5 V through the coax cable to power the internal antenna amplifier.

Conditions for Running the DTC

- Ignition is in the RUN or ACC position.
- System voltage is between 9.5 V and 15.5 V.
- The above conditions are present for greater than 1 second.

Conditions for Setting the DTC

B2462 02

The Telematics Communication Interface Control Module detects a short to ground on the GPS antenna signal circuit.

B2462 04

The Telematics Communication Interface Control Module detects an open/high resistance on the GPS antenna signal circuit.

Action Taken When the DTC Sets

- The OnStarÃ‚Â® status LED turns red.

- The OnStarÃ,Â® Call Center cannot locate the vehicle.

Conditions for Clearing the DTC

- The K73 Telematics Communication Interface Control Module detects the presence of a GPS antenna.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Special Tools

EL-49903 GM OnStar Antenna Diagnostic Tool Kit

Circuit/System Testing

1. Ignition OFF/vehicle OFF, disconnect the GPS coax cable connector at the K73 Telematics Communication Interface Control Module.
2. Connect the **EL-49903-1** OnStar Test Antenna, Navn-Cell Comn to the K73 Telematics Communication Interface Control Module. Place the test antenna on the roof of the vehicle, ignition ON/vehicle in Service Mode.
3. Verify DTC B2462 is not set or that the OnStar advisor can locate the vehicle.
    - **If DTC B2462 is set or the advisor can not locate the vehicle**

      Replace the K73 Telematics Communication Interface Control Module.

    - **If DTC B2462 is not set or that the OnStar advisor can locate the vehicle.**
4. Ignition OFF/vehicle OFF, disconnect the **EL-49903-1** OnStar Test Antenna, Navn-Cell Comn from the K73 Telematics Communication Interface Control Module
5. Disconnect the GPS coax cable at the T2RR Antenna - Roof Rear.
6. Test the coax cable between the K73 Telematics Communication Interface Control Module and the T2RR Antenna - Roof Rear. Refer to component testing.
    - **If the coax cable does not pass the test**

      Replace the coax cable.

    - **If the coax cable passes the test**
7. Test or replace the T2RR Antenna - Roof Rear.

Component Testing

CAUTION: Refer to Test Probe Caution

NOTE:

- **Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.**
- **To prevent false readings when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.**

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.
2. Test for less than 5 Ω between the coax cable center terminal end to end.
   - **If 5 Ω or greater**

     Replace the coax cable.

   - **If less than 5 Ω**
3. Test for greater than 5 Ω between the coax cable outer shield end to end.
   - **If 5 Ω or greater**

     Replace the coax cable.

   - **If less than 5 Ω**
4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
   - **If less than infinite resistance**

     Replace the coax cable.

   - **If infinite resistance**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the diagnostic procedure.

- Refer to High Frequency Antenna Replacement
- Refer to Control Module References for Telematics Communication Interface Control Module replacement, programming and setup.

DTC B2470: CELLULAR PHONE ANTENNA CIRCUIT MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptors

DTC B2470 02

Cellular Phone Antenna Circuit Malfunction Short to Ground

DTC B2470 04

Cellular Phone Antenna Circuit Malfunction Open Circuit

Circuit/System Description

The primary cellular phone antenna element is connected to the telematics communication interface control module (violet connector) via a shielded coaxial cable. Cellular communication takes place on both the primary cellular antenna signal circuit and the GPS/secondary cellular antenna signal circuit. This diagnostic only applies to the primary cellular antenna signal circuit. Internal to the antenna on the cellular antenna signal circuit resistance is used to apply a load, which the telematics communication interface control module uses to detect the presence of the antenna.

Conditions for Running the DTC

- Ignition in the RUN or ACC position.
- System voltage is between 9.5 V and 15.5 V.
- The above conditions are present for greater than 1 s.

Conditions for Setting the DTC

B2470 02

The telematics communication interface control module detects a short to ground on the primary cellular antenna signal circuit.

B2470 04

- The telematics communication interface control module detects an open or high resistance on the primary cellular antenna signal circuit.
- The above conditions are present for greater than 1 s.

Action Taken When the DTC Sets

The OnStarÃ‚Â® status LED turns red.

Conditions for Clearing the DTC

- The telematics communication interface control module detects the presence of a cellular antenna.
- A history DTC clears after 50 malfunction-free ignition cycles.

Special Tools

EL-49903-1 Test Antenna Navn-Cell Comn

Circuit/System Testing

NOTE:

- **The vehicle may be equipped with sectioned coax. Test each section and replace only the faulty section, not the entire length of coax.**
- **The following verification requires the vehicle to be outside with an unobstructed view of the southern sky. Allow 5 min after turning the ignition ON for the GPS satellites to acquire vehicle signal.**

1. Ignition OFF/Vehicle OFF and all vehicle systems OFF, disconnect the violet primary cellular coax cable connector at the K73 Telematics Communication Interface Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Using the **EL-49903-1** Test Antenna Navn-Cell Comn connect the violet coax cable to the K73 Telematics Communication Interface Control Module. Place the test antenna on the roof of the vehicle, ignition ON/vehicle in Service Mode.
3. Verify the DTC does not set or a call can be completed to the OnStar Call Center while operating the vehicle within the conditions for running the DTC.
   - **If the DTC sets or a call can not be completed to the OnStar Call Center**

     Replace the K73 Telematics Communications Interface Control Module.

   - **If the DTC does not set or a call can be completed to the OnStar Call Center**
4. Ignition OFF/Vehicle OFF.
5. Disconnect the **EL-49903-1** Test Antenna Navn-Cell Comn from the K73 Telematics Communication Interface Control Module
6. Test the coax cable. Refer to Component Testing.
   - **If the coax cable does not pass the test**

     Replace the coax cable.

   - **If the coax cable passes the test**
7. Test or replace the T2RR Antenna - Roof Rear.

Component Testing

CAUTION: **Refer to Test Probe Caution**

NOTE:

- **Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.**
- **To prevent false readings when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.**

Coax Cable Test

1. Test for less than 5 Ω between the coax cable center terminal end to end.
   - **If 5 Ω or greater**

     Replace the coax cable.

   - **If less than 5 Ω**
2. Test for greater than 5 Ω between the coax cable outer shield end to end.
   - **If 5 Ω or greater**

     Replace the coax cable.

   - **If less than 5 Ω**
3. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
   - **If less than infinite resistance**

Replace the coax cable.

- **If infinite resistance**

4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair procedure.

- Refer to **High Frequency Antenna Replacement**
- Refer to **Control Module References** for telematics communication interface control module replacement, setup, and programming

DTC B2476 OR B2482: CELLULAR PHONE SELECT SERVICE SWITCH

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B2476 or B2482

Cellular Phone Select Service Switch

For symptom byte information refer to **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
10 V Reference	B2476 02	B2476 04	B2476 04	-
Signal	1	1	B2476 59	B2476 59, B2482 00
Ground	-	B2476 04	-	-
1. OnStarÃ‚Â® Buttons Inoperative				

Circuit/System Description

The OnStarÃ‚Â® button assembly consists of 3 buttons: Call/Answer, OnStarÃ‚Â® Call Center, and OnStarÃ‚Â® Emergency. The telematics communication interface control module supplies the OnStarÃ‚Â® button assembly with 10 V via the 10 V reference circuit. Each of the buttons, when pressed, completes the circuit across a resistor allowing a specific voltage to be returned to the telematics communication interface control module over the keypad signal circuit. Depending upon the voltage range returned, the telematics communication interface control module is able to identify which button has been pressed.

Conditions for Running the DTC

- Ignition ON/vehicle in Service Mode.
- Battery voltage must be between 9 - 16 V.

Conditions for Setting the DTC

B2476 02

The telematics communication interface control module detects a short to ground on the 10 V reference circuit

B2476 04

The telematics communication interface control module detects an open/high resistance on the keypad supply voltage circuit or the ground circuit.

B2482 and B2476 59

The telematics communication interface control module detects a valid signal on the keypad signal circuit for longer than 15 s. If one of the OnStarÃ‚Â® buttons is held or stuck for 15 s or greater, the telematics communication interface control module will set this DTC.

Action Taken When the DTC Sets

- The OnStarÃ‚Â® status LED turns red.
- No calls can be placed.
- The telematics communication interface control module will ignore all inputs from the OnStarÃ‚Â® button assembly.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Verification

NOTE: **Contact the OnStarÃ‚Â® Call Center first before pressing the emergency button in order to notify them of the test.**

1. Ignition ON/vehicle in Service Mode.
2. Verify that each button of the S51 Telematics Button Assembly operates normally by pressing each button individually.
    - **If none of the buttons operate normally**

      Refer to Circuit/System testing

    - **If some, but not all, of the buttons operate normally**

      Test or replace the S51 Telematics Button Assembly

    - **If all of the buttons operate normally**
3. All OK.

Circuit/System Testing

1. Ignition OFF/vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S51 Telematics Button Assembly. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
    - **If 10 Ω or greater**
    1. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON/vehicle in Service Mode.
4. Test for 8.0 - 10.5 V between the 10 V reference circuit terminal 1 and the ground circuit terminal 6.
    - **If less than 8.0 V**
    1. Ignition OFF/vehicle OFF, disconnect the harness connector at the K73 Telematics Communication Interface Control Module.
    2. Test for infinite resistance between the 10 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 10 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K73 Telematics Communication Interface Control Module.
    - **If greater than 10.5 V**
    1. Ignition OFF/vehicle OFF, disconnect the harness connector at the K73 Telematics Communication Interface Control Module, ignition ON/vehicle in Service Mode.
    2. Test for less than 1 V between the 10 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
    - **If between 8.0 - 10.5 V**
5. Ignition OFF/vehicle OFF.
6. Test for 500 - 900 Ω between the signal circuit terminal 3 and the ground circuit terminal 6.
    - **If less than 500 Ω**
    1. Disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K73 Telematics Communication Interface Control Module.
    - **If greater than 900 Ω**
    1. Disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON/vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Ignition OFF/vehicle OFF.
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K73 Telematics Communication Interface Control Module.
    - **If between 500 - 900 Ω**
7. Test or replace the S51 Telematics Button Assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Communication Center Call Switch Replacement**

- Refer to Control Module References for telematics communication interface control module replacement, programming and setup

SYMPTOMS - CELLULAR COMMUNICATION

NOTE: The following steps must be completed before using the symptom table.

1. Perform the Diagnostic System Check - Vehicle before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to OnStar Description and Operation (UE3)OnStar Description and Operation (UE1).

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Radio/Audio System. Refer to Checking Aftermarket Accessories .
- Inspect for easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- Bluetooth Malfunction
- No Global Positioning System (GPS) Reception
- OnStar Microphone Malfunction
- OnStar Audio Malfunction
- OnStar Button LED Malfunction
- OnStar Call Center Remote Function Requests Malfunction
- OnStar Button Malfunction
- Unable to Contact OnStar Call Center
- OnStar Voice Recognition Malfunction
- OnStar Steering Wheel Control Functions Malfunction

SYMPTOMS - ENTERTAINMENT

IMPORTANT: The following steps must be completed before using the symptom table.

1. Perform the Diagnostic System Check - Vehicle before using the Symptom Tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to Radio/Audio System Description and Operation.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the Radio/Audio System. Refer to Checking Aftermarket Accessories .
- Inspect for easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Auxiliary Audio Input Malfunction**
- **Bluetooth Malfunction**
- **Digital Radio Poor or No Reception**
- **Radio Controls Malfunction**
- **Radio Information Display Malfunction**
- **Radio Poor Reception**
- **Speaker Malfunction (UQA)Speaker Malfunction (without UQA)**

AUXILIARY AUDIO INPUT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B124B

USB 1 Circuit

For symptom byte information refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	B124B, 1, 6	1, 5	-	-
Auxiliary Audio Common Signal	-	8	-	-
Auxiliary Detection Signal	7	8	-	-
Left Auxiliary Audio Signal	2	2	2, 4	-
Right Auxiliary Audio Signal	3	3	3, 4	-
USB Cable	B124B	B124B	B124B	-
Ground	-	1	-	-
1. USB port Inoperative 2. No left side audio from device connected to AUX jack 3. No right side audio from device connected to AUX jack 4. Noticeable distortion may be present in affected audio channel 5. Fault may affect one or more components, dependant on fault location 6. Fault affects multiple components, dependant on vehicle equipment 7. Radio does not detect auxiliary device connection, AUX not available as input selection 8. AUX always available as an input selection, with or without auxiliary device connected				

Circuit/System Description

The infotainment system has a auxiliary jack and USB receptacle assembly. The auxiliary jack and USB receptacle assembly receives fused battery voltage and ground from the harness to power the internal hub device as well as providing additional amperage to power USB devices. The internal hub device interfaces directly with the radio via a standard USB cable.

Auxiliary Audio Input Jack

When a portable audio playback device is connected to the 3.5 mm (1/8 in.) auxiliary audio input jack an internal switch opens the detection signal circuit. The radio detects the device and AUX becomes available as an audio source. Audio signals from the device are sent to the radio from the auxiliary input jack via the left, right, and common audio signal circuits.

USB Port

The USB receptacle interfaces directly with the radio via a standard USB cable. A Mini type USB connector is used to connect the cable at the radio and at the auxiliary jack and USB receptacle assembly. USB male to female connections are typically used for connecting USB cables together where an in-line connection is required. An in-line cable connection is typically found between the console and I/P harness.

The USB port allows connectivity to the infotainment system from portable media players or a USB storage device (memory stick/flash drive). When a device is connected to the USB port, the system detects the device and USB becomes available as an audio source. Once connected, the device can be controlled from the radio controls.

Not all portable media player devices or file types are compatible. Refer to the owner's manual for information on USB devices, control, and operation.

Conditions for Running the DTC

- Ignition is ON or in the ACC position/vehicle in Service Mode
- The system voltage is 9-16 V
- The infotainment system is ON
- The test is run once per second when the infotainment system is operating

Conditions for Setting the DTC

The radio detects an excessive current condition on the USB 5 V circuit.

Action Taken When the DTC Sets

The USB port is inoperative while the DTC is current.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Diagnostic Aids

This DTC may be set due to the connection of an incompatible or faulty USB device.

Circuit/System Verification

1. Verify DTC B124B is not set. Since occurrences of this DTC can be caused by an incompatible or faulty USB device, review with the customer the conditions under which their concern occurred.
   - **If DTC B124B is set.**

     Refer to Circuit/System testing.

   - **If DTC B124B is not set.**
2. Ignition ON/vehicle in Service Mode, infotainment system ON.
3. Connect the EL-50334-20 Multi-Media Interface Tester (MIT) to the X83 Auxiliary Audio Input USB port and select the USB test mode.
4. Verify the audio from the EL-50334-20 Multi-Media Interface Tester (MIT) is heard through the infotainment system while operating the system to play audio from the test tool.
   - **If audio is not heard from the test tool**

     Refer to Circuit/System Testing.

   - **If audio is heard from the test tool**
5. All OK.

Circuit/System Testing

1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the X83 Auxiliary Audio Input.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
   - **If 10 Ω or greater**
   1. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Verify that a test lamp illuminates between the B+ circuit terminal 6 and ground.
   - **If the test lamp does not illuminate**
   1. Remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
   - **If the test lamp illuminates**
4. Verify the USB cable is properly connected at all components and any in-line connections, and there is no damage to the cable or connections.
   - **If connection problems or cable damage is noted.**

     Perform the appropriate repair or replacement to correct any issues.

   - **If no connection problems or cable damage is noted.**
5. Disconnect the vehicle USB cable at the A11 Radio and the X83 Auxiliary Audio Input.
6. Connect the EL-50334-14 Infotainment Test Cable and the EL-50334-2 Type-A Female to Mini-B Male Cable together. Connect the assembled test cable to the A11 Radio and the X83 Auxiliary Audio Input.
7. Ignition ON/vehicle in Service Mode, infotainment system ON.
8. Connect the EL-50334-20 Multi-Media Interface Tester (MIT) to the X83 Auxiliary Audio Input USB port and select the USB test mode.
9. Verify the audio from the EL-50334-20 Multi-Media Interface Tester (MIT) is heard through the infotainment system while operating the system to play audio from the test tool.

- **If audio is not heard from the test tool**
  1. Replace the X83 Auxiliary Audio Input. Connect all harness connectors.
  2. Connect the EL-50334-20 Multi-Media Interface Tester (MIT) to the X83 Auxiliary Audio Input USB port and select the USB test mode.
  3. Verify the audio from the EL-50334-20 Multi-Media Interface Tester (MIT) is heard through the infotainment system while operating the system to play audio from the test tool.
     - If audio is not heard from the test tool, replace the A11 Radio.
     - If audio is heard from the test tool.
  4. All OK.
- **If audio is heard from the test tool**

10. Replace the USB cable assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Audio Disc Player and USB Receptacle Replacement**
- Refer to **Control Module References** for control module replacement, programming, and setup.

BLUETOOTH MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

BluetoothÃ,Â® wireless technology is a short-range communications technology intended to replace the cables connecting portable and/or fixed devices while maintaining high levels of security. The operating range of the signal is approximately 30 feet.

The available features and functions are determined by the type of device and the software within the devices being used. For a feature or function to operate, it must be supported in both devices.

The BluetoothÃ,Â® hardware is internal to the radio. The radio supports interfacing with cellular phones for hands-free features.

Refer to the vehicle owner manual, supplements, and the device manufacturer's information for information on devices, control, operation. and pairing instructions.

Diagnostic Aids

- Verify the mobile device is properly configured for the feature being used. Refer to the device manufacturer's information.
- Verify the function/feature that is being used is supported by the mobile device.
- The device must be paired to the radio to use the available BluetoothÃ,Â® feature(s). The pairing process must only be performed once for each device, unless that device's information is deleted.
- The system can store pairing information for multiple devices, but can only be actively connected to one at any given time.

Special Tools

EL-50334-20 Multi-Media Interface Tester (MIT)

For equivalent regional tools, refer to **Special ToolsSpecial Tools (MIT Tool Instructions)**.

Circuit/System Verification

1. Verify no DTCs are present.
    - **If any DTCs are present**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no DTCs are present**
2. Verify the A11 Radio calibrations are current.
    - **If the radio calibrations are not current**

      Reprogram the A11 Radio and re-evaluate the concern.

    - **If no update calibrations are available**

NOTE: **The MIT tool can be used to test either cellular phone or streaming audio functions. Refer to the tool instructions, and perform the appropriate test(s) related to the customers concern in the following steps.**

3. Ignition ON, infotainment system ON.
4. Verify the infotainment system successfully pairs with the MIT tool.
    - **If the infotainment system does not successfully pair with the MIT tool.**

      Replace the A11 Radio.

    - **If the infotainment system successfully pairs with the MIT tool.**
5. Verify the infotainment system successfully completes the desired feature test using the MIT tool.
    - **If the feature test is not successful**

      Replace the A11 Radio.

    - **If the feature test is successful**
6. All OK. Refer to Diagnostic Aids.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for radio replacement, programming, and setup

DIGITAL RADIO POOR OR NO RECEPTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B125C 01

Satellite Antenna Circuit Short to Battery

DTC B125C 02

Satellite Antenna Circuit Short to Ground

DTC B125C 04

Satellite Antenna Circuit Open

Circuit/System Description

The digital radio receiver, located inside the radio, receives digital radio information from the digital radio antenna located on the outside of the vehicle. The digital radio receiver is connected to the digital radio antenna via a shielded coax cable. The digital radio antenna contains an amplifier which is powered by the radio through the coax cable.

Conditions for Running the DTC

This DTC is run every 300 milliseconds.

Conditions for Setting the DTC

The radio detects a circuit fault in the digital radio antenna.

Action Taken When the DTC Sets

The radio displays No XM Signal or Check Antenna.

Conditions for Clearing the DTC

- A current DTC clears when the condition for setting the DTC is no longer present.
- A history DTC clears after 100 malfunction-free ignition cycles.

Diagnostic Aids

The digital radio antenna requires a clear line of sight to the sky to operate properly. Reception may be limited, intermittent, or unavailable inside structures.

Special Tools

EL-48028 Digital Radio Test Antenna

Circuit/System Verification

1. With the vehicle outside in an area with an unobstructed view of the southern sky, tune to XM.
2. Verify DTC B125C is not set as current and the No XM Signal message is not displayed on the radio.
    - **If DTC B125C is set as current or the No XM Signal message is displayed.**

      Refer to Circuit/System Testing.

    - **If DTC B125C is not set as current and the No XM Signal message is not displayed.**
3. All OK.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, disconnect the digital radio antenna coax cable from the A11 Radio. Connect the **EL-48028** Digital Radio Test Antenna to the radio and place on the roof of the vehicle.
2. Ignition ON/Vehicle in Service Mode, radio tuned to XM channel 1.
3. Verify DTC B125C is not set as current and XM reception is improved.
    - **If DTC B125C is set as current or XM reception is not improved**

      Replace the A11 Radio.

    - **If DTC B125C is not set as current and XM reception is improved**
4. Ignition OFF/Vehicle OFF, disconnect the digital radio antenna coax cable from the T2RR Antenna - Roof Rear.
5. Verify the digital radio antenna coax cable passes the coax cable component test. Refer to Component Testing.
    - **If the coax cable does not pass the test**

      Replace the antenna coax cable

    - **If the coax cable passes the test**
6. Test or replace the T2RR Antenna - Roof Rear.

Component Testing

CAUTION: **Refer to Test Probe Caution .**

NOTE: **Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.**

To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF/Vehicle OFF, disconnect the coax cable at both components.
2. Test for less than 5 Ω between coax cable center terminal end to end.
    - **If 5 Ω or greater**

      Replace the coax cable

    - **If less than 5 Ω**
3. Test for less than 5 Ω between the coax cable outer shield end to end.

- **If 5 Ω or greater**

  Replace the coax cable

- **If less than 5 Ω**

4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
   - **If less than infinite resistance**

     Replace the coax cable

   - **If infinite resistance**
5. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **High Frequency Antenna Replacement**
- Refer to **Control Module References** for radio replacement, programming, and setup.

ONSTAR MICROPHONE MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Microphone High Signal Terminal 9	B2455 02	B2455 04	B2455 04	-
Microphone Low Signal Terminal 10	B2455 02	B2455 04	B2455 04	-
Cellular Telephone Voice Signal Terminal 6	2	1	2	-
Cellular Telephone Voice Low Signal Terminal 12	-	2	2	-
1. Voice Cannot be Heard by Telephone Conversation Partner 2. Customer Voice may be distorted for Telephone Conversation Partner				

Circuit/System Description

The telematics communication interface control module provides the Cellular Phone Microphone with a supplied voltage on the cellular phone microphone signal circuit. When the cellular phone microphone is in use, voice data from the user is sent back to the telematics communication interface control module on the signal circuit.

Circuit/System Verification

NOTE: **It is necessary to have the vehicle in a quiet, open outside area where a cellular call can be successfully placed and GPS data can be received from satellites.**

1. Vehicle in Service Mode.
2. Verify that DTC B2455 is not set.
   - **If DTC B2455 is set**

     Refer to DTC B2455.

   - **If DTC B2455 is not set**
3. Verify that a successful OnStar voice command can be made.
   - **If your voice can not be heard clearly**

     Refer to Circuit/System Testing - Microphone Malfunction.

   - **If your voice can be heard clearly**
4. Verify that your voice is heard clearly by the OnStar Call Center after completing a blue button press.
   - **If your voice can not be heard clearly**

     Refer to Circuit/System Testing - Cellular Telephone Voice Malfunction.

   - **If your voice can be heard clearly**
5. All OK.

Circuit/System Testing

Microphone Malfunction

1. Vehicle OFF, disconnect the harness connector at the B24 Cellular Phone Microphone, vehicle in Service Mode.
2. Test for 8.0-10.5 V between the signal circuit terminal B and ground.
   - **If less than 8.0 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground in the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the vehicle K73 Telematics Communication Interface Control Module.
   - **If greater than 10.5 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.

        - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
    - **If between 8.0-10.5 V**
3. Test for less than 1 V between the signal circuit terminal A and ground.
    - **If greater than 1 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage in the circuit.
        - If less than 1 V, repair the K73 Telematics Communication Interface Control Module.
    - **If less than 1 V**
4. Test for greater than 8 V between the signal circuit terminal B and the signal circuit terminal A.
    - **If less than 8 V**
    1. Vehicle OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the vehicle K73 Telematics Communication Interface Control Module.
    - **If greater than 9 V**
5. Test or replace the B24 Cellular Phone Microphone.

Cellular Telephone Voice Malfunction

1. Vehicle OFF and vehicle systems OFF, disconnect the X2 harness connector at the K73 Telematics Communication Interface Control Module and the X4 harness connector at the A11 Radio, vehicle in Service Mode.
2. Test for less than 1 V between the signal circuits listed below and ground.
    - K73 Telematics Communication Interface Control Module signal circuit Terminal 6
    - K73 Telematics Communication Interface Control Module signal circuit Terminal 12
    - **If greater than 1 V**

      Repair the short to voltage in the circuit.

    - **If less than 1 V**
3. Vehicle OFF.
4. Test for infinite resistance between the signal circuits listed below and ground.
    - K73 Telematics Communication Interface Control Module signal circuit Terminal 6
    - K73 Telematics Communication Interface Control Module signal circuit Terminal 12
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
5. Test for less than 2 Ω in the signal circuits listed below end to end.
    - K73 Telematics Communication Interface Control Module signal circuit Terminal 6
    - K73 Telematics Communication Interface Control Module signal circuit Terminal 12
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
6. Replace the K73 Telematics Communication Interface Control Module.
7. Verify that your voice is heard clearly by the OnStar Call Center after completing a blue button press.

- **If your voice can not be heard clearly**

  Replace the A11 Radio.

- **If your voice can be heard clearly**

8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair procedure.

- Refer to **Mobile Telephone Microphone Replacement**
- Refer to **Control Module References** for telematics communication interface control module replacement, programming, and setup

ONSTAR AUDIO MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Audio Signal	1	1	1	-
Audio Common Signal	-	1	-	-
1. No or noisy OnStarÃ‚Â® audio				

Circuit/System Description

When an OnStarÃ‚Â® keypress is made, a serial data message is sent to the audio system to mute all radio functions and output OnStarÃ‚Â® originated audio. After the audio system is muted, the telematics communication interface control module transmits signals to the audio system on the audio signal and audio common circuits.

Circuit/System Verification

1. Ignition ON/vehicle in Service Mode, radio ON.
2. Verify that audio is heard clearly through all speaker channels when tuning radio to a known good station.
    - **If audio is not heard clearly**

      Refer to **Speaker Malfunction (UQA)Speaker Malfunction (without UQA)**

    - **If audio is heard clearly**
3. Verify that the Connecting to OnStarÃ,Â® message is heard clearly through the audio system when the OnStarÃ,Â® blue button is pressed.
    - **If OnStar message is noisy or distorted**

      Refer to Circuit/System Testing

    - **If OnStar message is heard clearly**
4. All OK.

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, disconnect the X1 harness connector at the A11 Radio and the X2 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON/vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit terminals listed below and ground:
    - K73 Telematics Communication Interface Control Module signal circuit terminal 1 X2
    - K73 Telematics Communication Interface Control Module signal circuit terminal 2 X2
    - **If 1 V or greater**

      Repair the short to voltage on the circuit.

    - **If less than 1 V**
3. Ignition OFF/Vehicle OFF.
4. Test for infinite resistance between the signal circuits listed below and ground:
    - K73 Telematics Communication Interface Control Module signal circuit terminal 1 X2
    - K73 Telematics Communication Interface Control Module signal circuit terminal 2 X2
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.

    - **If infinite resistance**
5. Test for less than 2 Ω between the signal circuit terminals listed below:
    - K73 Telematics Communication Interface Control Module signal circuit terminal 1 X2 and the A11 Radio signal circuit terminal 10 X1
    - K73 Telematics Communication Interface Control Module signal circuit terminal 2 X2 and the A11 Radio signal circuit terminal 9 X1
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 2 Ω**
6. Replace the K73 Telematics Communication Interface Control Module.
7. Verify that the Connecting to OnStarÃ,Â® message is heard clearly through the audio system when the OnStarÃ,Â® blue button is pressed.
    - **If audio is not heard clearly**

      Replace the A11 Radio.

    - **If audio is heard clearly**
8. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for module replacement, programming, and setup.

NO GLOBAL POSITIONING SYSTEM (GPS) RECEPTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B2462 02

Global Positioning System (GPS) Signal Short to Ground

DTC B2462 04

Global Positioning System (GPS) Signal Open Circuit

Circuit/System Description

The Telematics Communication Interface Control Module receives information from the GPS antenna located on the outside of the vehicle. The GPS antenna is connected to the Telematics Communication Interface Control Module via a shielded coaxial cable. The telematics communication interface control module supplies 5 V through the coax cable to power the internal antenna amplifier.

Conditions for Running the DTC

- Ignition is in the RUN or ACC position.
- System voltage is between 9.5 V and 15.5 V.
- The above conditions are present for greater than 1 second.

Conditions for Setting the DTC

B2462 02

The Telematics Communication Interface Control Module detects a short to ground on the GPS antenna signal circuit.

B2462 04

The Telematics Communication Interface Control Module detects an open/high resistance on the GPS antenna signal circuit.

Action Taken When the DTC Sets

- The OnStarÃ‚Â® status LED turns red.
- The OnStarÃ‚Â® Call Center cannot locate the vehicle.

Conditions for Clearing the DTC

- The K73 Telematics Communication Interface Control Module detects the presence of a GPS antenna.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

EL-49903 GM OnStar Antenna Diagnostic Tool Kit

Circuit/System Testing

1. Ignition OFF/vehicle OFF, disconnect the GPS coax cable connector at the K73 Telematics Communication Interface Control Module.
2. Connect the **EL-49903-1** OnStar Test Antenna, Navn-Cell Comn to the K73 Telematics Communication Interface Control Module. Place the test antenna on the roof of the vehicle, ignition ON/vehicle in Service Mode.
3. Verify DTC B2462 is not set or that the OnStar advisor can locate the vehicle.
    - **If DTC B2462 is set or the advisor can not locate the vehicle**

      Replace the K73 Telematics Communication Interface Control Module.

    - **If DTC B2462 is not set or that the OnStar advisor can locate the vehicle.**
4. Ignition OFF/vehicle OFF, disconnect the **EL-49903-1** OnStar Test Antenna, Navn-Cell Comn from the K73 Telematics Communication Interface Control Module
5. Disconnect the GPS coax cable at the T2RR Antenna - Roof Rear.
6. Test the coax cable between the K73 Telematics Communication Interface Control Module and the T2RR Antenna - Roof Rear. Refer to component testing.
    - **If the coax cable does not pass the test**

      Replace the coax cable.

    - **If the coax cable passes the test**
7. Test or replace the T2RR Antenna - Roof Rear.

Component Testing

CAUTION: Refer to **Test Probe Caution**

NOTE:

- **Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.**
- **To prevent false readings when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.**

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.
2. Test for less than 5 Ω between the coax cable center terminal end to end.
    - **If 5 Ω or greater**

Replace the coax cable.

- **If less than 5 Ω**

3. Test for greater than 5 Ω between the coax cable outer shield end to end.
    - **If 5 Ω or greater**

      Replace the coax cable.

    - **If less than 5 Ω**
4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
    - **If less than infinite resistance**

      Replace the coax cable.

    - **If infinite resistance**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the diagnostic procedure.

- Refer to **High Frequency Antenna Replacement**
- Refer to **Control Module References** for Telematics Communication Interface Control Module replacement, programming and setup.

ONSTAR BUTTON LED MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control Terminal 4	1	1	2	-
Control Terminal 5	1	1	2	-
Ground	-	B2476 04	-	-
1. OnStarÃ,Â® Indicator Inoperative 2. Indicator Illuminated At All Times				

Circuit Description

The OnStarÃ,Â® status Indicators are located in the button assembly. The Green Indicator is illuminated when the system is ON and operating normally. When the Green Indicator is green and flashing, it is an indication that a call is in progress. When the Red Indicator is illuminated, a system malfunction is present. In the event there is a system malfunction and the OnStarÃ,Â® system is still able to make a call, the Indicator will flash red during the call. The OnStarÃ,Â® Indicators are controlled by the telematics communication interface control module via the keypad Green Indicator control circuit and the keypad Red Indicator control circuit.

Circuit/System Verification

NOTE: **If the green LED is off with the ignition ON and the LED does not function when commanded with the scan tool, contact the OnStar Center to confirm the vehicle has a current subscription.**

1. Ignition ON/vehicle in Service Mode.
2. Verify no DTCs are set.
   - **If any DTCs are set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle

   - **If no DTCs are set**
3. Verify that the Green Indicator turns ON and OFF when commanding the Green Indicator ON and OFF with a scan tool.
   - **If the Green Indicator does not turn ON and OFF**

     Refer to Circuit/System Testing - Green Indicator Test

   - **If the Green Indicator turns ON and OFF**
4. Verify that the Red Indicator turns ON and OFF when commanding the Red Indicator ON and OFF with a scan tool.
   - **If the Red Indicator does not turn ON and OFF**

     Refer to Circuit/System Testing - Red Indicator Test

   - **If the Red Indicator turns ON and OFF**
5. All OK.

Circuit/System Testing

Green Indicator Test

1. Ignition OFF/vehicle OFF, and all vehicle systems OFF, disconnect the harness connector at the S51 Telematics Button Assembly. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF/vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON/vehicle in Service Mode.
4. Test for less than 1 V between the control circuit terminal 4 and ground while commanding the Green Indicator OFF with a scan tool.
   - **If 1 V or greater**

   1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON/vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
   - **If less than 1 V**
5. Test for greater than 8 V between the control circuit terminal 4 and ground while commanding the Green Indicator ON with a scan tool.
   - **If 8 V or less**
   1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K73 Telematics Communication Interface Control Module.
   - **If greater than 8 V**
6. Test or replace the S51 Telematics Button Assembly.

Red Indicator Test

1. Ignition OFF/vehicle OFF, and all vehicle systems OFF, disconnect the harness connector at the S51 Telematics Button Assembly. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
   - **If 10 Ω or greater**
   1. Ignition OFF/vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON/vehicle in Service Mode.
4. Test for less than 1 V between the control circuit terminal 5 and ground while commanding the Red Indicator OFF with a scan tool.
   - **If 1 V or greater**
   1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON/vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
   - **If less than 1 V**
5. Test for greater than 8 V between the control circuit terminal 5 and ground while commanding the Red Indicator ON with a scan tool.
   - **If 8 V or less**
   1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K73 Telematics Communication Interface Control Module.

- **If greater than 8 V**

6. Test or replace the S51 Telematics Button Assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Communication Center Call Switch Replacement**
- Refer to **Control Module References** for telematics communication interface control module replacement, programming and setup.

ONSTAR CALL CENTER REMOTE FUNCTION REQUESTS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

The telematics communication interface control module has the capability of commanding the horn, initiating door lock/unlock, or operating the exterior lamps using the serial data circuits. These functions are commanded by the OnStarÃ,Â® Call Center per a customer request.

Diagnostic Aids

The customer concern may have been due to a lack of cellular service in a given area, or a failure in the National Cellular Network infrastructure that has since been corrected.

Circuit/System Verification

NOTE:

- **It is necessary to inform the OnStarÃ,Â® Call Center advisor that this call is for vehicle diagnostic purposes.**
- **It is necessary to have the vehicle in an open outside area where a cellular call can be successfully placed and GPS data can be received from satellites.**

1. Vehicle in Service Mode.
2. Verify that the horn, lights, and the door locks on the vehicle operate properly.
    - **If an applicable vehicle system does not operate properly**

      Refer to Diagnostic System Check - Vehicle .

    - **If all applicable vehicle systems operate properly**
3. Verify that a call can be successfully placed to the OnStar Call Center by pressing the blue OnStar button.
    - **If unable to contact the OnStarÃ,Â® call center**

      Refer to Unable to Contact OnStar Call Center

    - **If able to contact the OnStar Call Center**
4. Verify with the OnStar advisor that all remote functions (door locks, lights, and horn) work.
    - **If the remote functions do not operate when requested**

      Replace the K73 telematics communication interface control module

    - **If the remote functions operate when requested**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Refer to Control Module References for telematics communication interface control module replacement, programming and setup.

ONSTAR BUTTON MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC B2476 or B2482

Cellular Phone Select Service Switch

For symptom byte information refer to Symptom Byte List

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
10 V Reference	B2476 02	B2476 04	B2476 04	-
Signal	1	1	B2476 59	B2476 59, B2482 00
Ground	-	B2476 04	-	-
1. OnStarÃ,Â® Buttons Inoperative				

Circuit/System Description

The OnStarÃ,Â® button assembly consists of 3 buttons: Call/Answer, OnStarÃ,Â® Call Center, and OnStarÃ,Â® Emergency. The telematics communication interface control module supplies the OnStarÃ,Â® button assembly with 10 V via the 10 V reference circuit. Each of the buttons, when pressed, completes the circuit across a resistor allowing a specific voltage to be returned to the telematics communication interface control module over the keypad signal circuit. Depending upon the voltage range returned, the telematics communication interface control module is able to identify which button has been pressed.

Conditions for Running the DTC

- Ignition ON/vehicle in Service Mode.
- Battery voltage must be between 9 - 16 V.

Conditions for Setting the DTC

B2476 02

The telematics communication interface control module detects a short to ground on the 10 V reference circuit

B2476 04

The telematics communication interface control module detects an open/high resistance on the keypad supply voltage circuit or the ground circuit.

B2482 and B2476 59

The telematics communication interface control module detects a valid signal on the keypad signal circuit for longer than 15 s. If one of the OnStarÃ,Â® buttons is held or stuck for 15 s or greater, the telematics communication interface control module will set this DTC.

Action Taken When the DTC Sets

- The OnStarÃ,Â® status LED turns red.
- No calls can be placed.
- The telematics communication interface control module will ignore all inputs from the OnStarÃ,Â® button assembly.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Verification

NOTE: **Contact the OnStarÃ,Â® Call Center first before pressing the emergency button in order to notify them of the test.**

1. Ignition ON/vehicle in Service Mode.
2. Verify that each button of the S51 Telematics Button Assembly operates normally by pressing each button individually.
    - **If none of the buttons operate normally**

      Refer to Circuit/System testing

    - **If some, but not all, of the buttons operate normally**

      Test or replace the S51 Telematics Button Assembly

    - **If all of the buttons operate normally**
3. All OK.

Circuit/System Testing

1. Ignition OFF/vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S51 Telematics Button Assembly. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 6 and ground.
    - **If 10 Ω or greater**
    1. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON/vehicle in Service Mode.
4. Test for 8.0 - 10.5 V between the 10 V reference circuit terminal 1 and the ground circuit terminal 6.
    - **If less than 8.0 V**
    1. Ignition OFF/vehicle OFF, disconnect the harness connector at the K73 Telematics Communication Interface Control Module.
    2. Test for infinite resistance between the 10 V reference circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the 10 V reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K73 Telematics Communication Interface Control Module.
    - **If greater than 10.5 V**
    1. Ignition OFF/vehicle OFF, disconnect the harness connector at the K73 Telematics Communication Interface Control Module, ignition ON/vehicle in Service Mode.
    2. Test for less than 1 V between the 10 V reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K73 Telematics Communication Interface Control Module.
    - **If between 8.0 - 10.5 V**
5. Ignition OFF/vehicle OFF.
6. Test for 500 - 900 Ω between the signal circuit terminal 3 and the ground circuit terminal 6.
    - **If less than 500 Ω**
    1. Disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K73 Telematics Communication Interface Control Module.
    - **If greater than 900 Ω**
    1. Disconnect the X1 harness connector at the K73 Telematics Communication Interface Control Module, ignition ON/vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.

        - If less than 1 V
    3. Ignition OFF/vehicle OFF.
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K73 Telematics Communication Interface Control Module.
  - **If between 500 - 900 Ω**
7. Test or replace the S51 Telematics Button Assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Communication Center Call Switch Replacement**
- Refer to **Control Module References** for telematics communication interface control module replacement, programming and setup

ONSTAR STEERING WHEEL CONTROL FUNCTIONS MALFUNCTION

Some vehicles equipped with the OnStarÃ‚® system have the capability of accessing voice mailboxes and other automated phone systems by means of the steering wheel controls, while the OnStarÃ‚® Personal Calling feature is in use. If the "Talk" or "Mute" button (depending upon the vehicle) on the steering wheel controls is depressed during an OnStarÃ‚® Personal Calling call, the telematics communication interface control module receives the message on the serial data bus from either the radio or body control module. This message is interpreted as a request to turn any spoken numbers into dual tone multi-frequency tones to be delivered over the airwaves to the phone system the user is communicating with. Complete instructions for operation of these features can be found in the information provided to the customer with the OnStarÃ‚® system.

The steering wheel controls are a resistor network that consist of multiple momentary contact switches and a series of resistors. The switches and resistor network are arranged so that each switch has a different resistance value. When a switch is pressed, a voltage drop occurs in the resistor network, which produces a specific voltage value unique to the switch selected, to be interpreted by either the radio or BCM. In the event the OnStarÃ‚® steering wheel control functions are inoperative, technicians should refer to **Steering Wheel Controls Malfunction** , to begin diagnosis of the steering wheel control concern.

RADIO CONTROLS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal terminal 6	B123E 02, 1	B123E 01, 1	B123E 01, 1	-
Signal terminal 5	2	2	2	-
Signal terminal 7	3	3	3	-
signal terminal 8	3	3	3	-
Low Reference terminal 10	-	4	-	-
1. Home, Seek Up, Seek Down, and/or Phone button will not function 2. Power Button will not function 3. Unable to adjust volume 4. All Radio Control buttons may not function				

Circuit/System Description

The radio info display module, radio controls and radio are all separate components. The radio controls communicate radio control inputs directly to the radio through a discrete circuit for volume up, volume down and power ON button. It also uses a series of resistors through a single signal circuit when the home, seek up, seek down and phone buttons are pressed. After receiving the message the radio will perform the requested function. The info display module receives digital video data from the radio for on-screen display information through the LVDS (Low Voltage Differential Signal) cable. The radio communicates with the info display module over the radio display touch interrupt request signal for touch screen inputs.

Circuit/System Verification

1. Verify DTC B123E is not set.
    - **If DTC B123E is set.**
    - Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**
    - **If DTC B123E is not set**
2. Ignition ON/vehicle in Service Mode, A11 Radio ON.
3. Verify that all radio controls operate and perform the correct function.
    - **If all or some of the radio controls are inoperative**

      Refer to Circuit/System Testing.

    - **If all radio controls operate and perform the correct function.**
4. All OK.

Circuit/System Testing

1. Ignition OFF/vehicle OFF, disconnect the harness connector at the A20 Radio/HVAC Controls.
2. Test for less than 10 Ω between the following low reference circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Disconnect the X1 harness connector at the P17 Info Display Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the P17 Info Display Module.
    - **If less than 10 Ω**
3. Ignition ON/vehicle in Service Mode, test for 2.5 - 3.5 V between the following signal circuit terminals and ground:
    - Terminal 5 @ A20 Radio/HVAC Controls Harness
    - Terminal 6 @ A20 Radio/HVAC Controls Harness
    - Terminal 7@ A20 Radio/HVAC Controls Harness

- Terminal 8 @ A20 Radio/HVAC Controls Harness
- **If less than 2.5 V**

1. Ignition OFF/vehicle OFF, disconnect the X1 & X2 harness connectors at the A11 Radio.
2. Test for infinite resistance between the following signal circuits and ground:
    - Terminal 5 @ A20 Radio/HVAC Controls Harness
    - Terminal 6 @ A20 Radio/HVAC Controls Harness
    - Terminal 7@ A20 Radio/HVAC Controls Harness
    - Terminal 8 @ A20 Radio/HVAC Controls Harness
    - If less than infinite resistance repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω between the following test points:
    - Terminal 5 @ A20 Radio/HVAC Controls Harness & Terminal 3 X2 @ A11 Radio Harness
    - Terminal 6 @ A20 Radio/HVAC Controls Harness & Terminal 8 X1 @ A11 Radio Harness
    - Terminal 7 @ A20 Radio/HVAC Controls Harness & Terminal 8 X2 @ A11 Radio Harness
    - Terminal 8 @ A20 Radio/HVAC Controls Harness & Terminal 9 X2 @ A11 Radio Harness
    - If 2 Ω or greater repair the open/high resistance in the circuit.
    - If less than 2 Ω replace the A11 Radio.

- **If greater than 3.5 V**

1. Ignition OFF/vehicle OFF, disconnect the X1 & X2 harness connectors at the A11 Radio.
2. Test for less than 1 V between the following signal circuits and ground:
    - Terminal 5 @ A20 Radio/HVAC Controls Harness
    - Terminal 6 @ A20 Radio/HVAC Controls Harness
    - Terminal 7 @ A20 Radio/HVAC Controls Harness
    - Terminal 8 @ A20 Radio/HVAC Controls Harness
    - If greater than 1 V repair the short to voltage in the circuit.
    - If less than 1 V replace the A11 Radio.

- **If between 2.5 - 3.5 V**

4. Replace the A20 Radio/HVAC Controls

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Refer to **Control Module References** for radio or radio control assembly replacement, programming, and setup.

RADIO INFORMATION DISPLAY MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.

Circuit/System Verification

1. Verify DTC B127E is not set.
    - **If DTC B127E is set.**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If DTC B127E is not set.**
2. Ignition ON/vehicle in Service Mode, A11 Radio ON.
3. Verify the P17 Info Display Module turns on and information is shown on the display.
    - **If the P17 Info Display Module does not turn on, or information is not shown in the display.**

      Refer to Circuit/System Testing- Blank Screen

    - **If the P17 Info Display Module turns on and information is shown on the display.**
4. Verify the touch screen feature functions by touching a selection on the display.
    - **If the display does not respond to the touch screen selection**

      Refer to Circuit/System Testing- Touch Screen

    - **If the display responds to the touch screen selection**
5. All OK.

Circuit/System Testing

Blank Screen

1. Ignition OFF/vehicle OFF and all vehicle systems OFF, disconnect the X1 harness connector @ P17 Info Display Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the following signal ground circuit terminals and ground:
    - terminal 9
    - terminal 10
    - **If 10 Ω or greater**

    1. Test for less than 2 Ω in the signal ground circuits end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than, 2 Ω repair the open/high resistance in the ground connection.

    - **If less than 10 Ω**
3. Ignition ON/vehicle in Service Mode.
4. Test for 5 V or greater between control circuit terminal 1 X1 and ground.
    - **If less than 5 V**

    1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the A11 Radio.
    2. Test for infinite resistance between the control circuit terminal 1 X1 @ P17 Info Display Module harness and ground.
        - If less than infinite resistance repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω between the test points: control circuit terminal 1 X1 @ P17 Info Display Module harness & terminal 3 X1 @ A11 Radio harness.
        - If 2 Ω or greater repair the open/high resistance in the circuit.
        - If less than 2 Ω replace the A11 Radio.

    - **If 5 V or greater**
5. Test for 4.7-5.3 V between the P17 Info Display Module harness terminal 3 X1 and ground.
    - **If less than 4.7 V**
6. Disconnect the harness connector at the A20 Radio/HVAC Controls.
    1. Test for infinite resistance between the P17 Info Display Module harness terminal 3 X1 and ground.
        - If less than infinite resistance repair the short to ground on the circuit.
        - If infinite resistance.
    2. Test for less than 2 Ω between the test points: voltage reference circuit terminal 3 X1 @ P17 Info Display Module harness & terminal 1 @ A20 Radio/HVAC Controls harness.
        - If 2 Ω or greater repair the open/high resistance in the circuit.
        - If less than 2 Ω
    3. Replace the A20 Radio/HVAC Controls.

    - **If greater than 5.3 V**
7. Disconnect the harness connector at the A20 Radio/HVAC Controls.
    1. Test for less than 1 V between terminal 3 X1 @ the P17 Info Display Module harness & ground.
        - If greater than 1 V repair the short to voltage in the circuit
        - If less than 1 V replace the A20 Radio/HVAC Controls

    - **If between 4.7-5.3 V**
8. Test or replace the P17 Info Display Module

Touch Screen

1. Ignition OFF/vehicle OFF and all vehicle systems OFF, disconnect the X1 harness connector @ P17 Info Display Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the following signal ground circuit terminals and ground:
    - terminal 9
    - terminal 10
    - **If 10 Ω or greater**

   1. Test for less than 2 Ω in the signal ground circuits end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON/vehicle in Service Mode.
4. Test for 1.5 - 2 V between the signal circuit terminal 7 and ground.
   - **If less than 1.5 V**
   1. Ignition OFF/vehicle OFF, disconnect the X2 harness connector at the A11 radio.
   2. Test for infinite resistance between the signal circuit terminal 7 X1 @ the P17 Info Display Module harness and ground.
      - If less than infinite resistance repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω between the test points: signal circuit terminal 7 X1 @ P17 Info Display Module harness & terminal 6 X2 @ A11 Radio harness.
      - If 2 Ω or greater repair the open/high resistance in the circuit.
      - If less than 2 Ω replace the A11 Radio.
   - **If greater than 2 V**
   1. Ignition OFF/vehicle OFF, disconnect the X2 harness connector at the A11 Radio.
   2. Test for less than 1 V between the signal circuit signal circuit terminal 7 X1 @ the P17 Info Display Module harness and ground.
      - If greater than 1 V repair the short to voltage in the circuit.
      - If less than 1 V replace the A11 Radio.
   - **If between 1.5 - 2 V**
5. Replace the P17 Info Display Module

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Control Module References** for control module replacement, programming, and setup.

RADIO POOR RECEPTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Radio Antenna Coax	B125A 02	B125A 04	1	-
Antenna Module Ground	-	1	-	-
1. May exhibit possible AM/FM interference.				

Circuit/System Description

The antenna amplifier receives both AM and FM signals from the antenna. The radio antenna amplifier is enabled when the radio is turned on. The radio provides battery voltage to the antenna amplifier using the center conductor of the antenna coaxial cable. When a 12 V signal is seen by the amplifier on the center conductor of the antenna coax, both AM and FM signals are amplified.

Diagnostic Aids

Poor AM and FM radio reception may be due to multiple influences, some of which may not be vehicle related. Areas which have high RF traffic or block the signal path may cause a degradation in radio reception. Radio reception may also be influenced by items within the vehicle, but not part of the radio system. Such examples are aftermarket electrical accessories or other items which may generate noise in the vehicle electrical system. Aftermarket window tinting, especially when there is a metallic in the film, may reduce radio reception.

AM reception is highly dependent on the antenna amplifier receiving battery voltage from the radio and being properly grounded. The antenna amplifier boosts both AM and FM reception. When the antenna amplifier does not receive power, AM stations may not be received and FM reception will be limited. If the amplifier is not properly grounded, excessive interference in the signal may occur, or reception may be limited.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Testing

1. Ignition OFF/Vehicle OFF, disconnect the radio antenna coax cable from the A11 Radio and from the T23 Radio Antenna Amplifier.
2. Verify the antenna coax cable passes the coax cable component test. Refer to Component Testing.
    - **If the coax cable does not pass the test**

      Replace the antenna coax cable

    - **If the coax cable passes the test**
3. Connect the antenna coax cable to the A11 Radio. Ignition ON/Vehicle in Service Mode, A11 Radio ON.
4. Verify a test lamp illuminates between the antenna coax cable center terminal and ground at the T23 Radio Antenna Amplifier connector.
    - **If the test lamp does not illuminate**

      Replace the A11 Radio.

    - **If the test lamp illuminates**
5. Test or replace the T23 Radio Antenna Amplifier.
6. Verify radio reception has improved.
    - **If radio reception has not improved**

      Test or replace the T2E Antenna - Rear End Spoiler

    - **If radio reception has improved**
7. All OK

Component Testing

CAUTION: Refer to Test Probe Caution .

NOTE: **Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause reception issues.**

To prevent false reading when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.

Coax Cable Test

1. Ignition OFF, disconnect the coax cable at both components.
2. Test for less than 5 Ω between coax cable center terminal end to end.
   - **If 5 Ω or greater**

     Replace the coax cable
   - **If less than 5 Ω**
3. Test for less than 5 Ω between the coax cable outer shield end to end.
   - **If 5 Ω or greater**

     Replace the coax cable
   - **If less than 5 Ω**
4. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
   - **If less than infinite resistance**

     Replace the coax cable
   - **If infinite resistance**
5. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Rear End Spoiler Replacement**
- Refer to **Radio Antenna Amplifier Replacement**
- Refer to **Control Module References** for radio replacement, programming, and setup.

SPEAKER REPLACEMENT REFERENCE

Component	Repair Instruction
Front Speakers	**Radio Front Side Door Speaker Replacement**
Front Tweeter Speakers	**Radio Windshield Side Garnish Molding Speaker Replacement**
Rear Speakers	**Radio Rear Side Door Speaker Replacement**
Rear Subwoofer	**Radio Rear Compartment Speaker Replacement**

SPEAKER MALFUNCTION (UQA)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Amplifier B+	1	1	-	-
LF Audio Signal	2	2	2, 3	2
LR Audio Signal	2	2	2, 3	2
RF Audio Signal	2	2	2, 3	2
RR Audio Signal	2	2	2, 3	2
Subwoofer Audio Signal	2	2	2, 3	2
Remote Enable Signal	1	1, 4	-	-
Amplifier Ground	-	1	-	-
1. Audio inoperative, no sound from all speakers. 2. No or reduced audio from speaker(s) on the affected audio circuit. 3. Noticeable audio distortion may be present. 4. Fault may affect one or more components, dependant on vehicle equipment.				

Circuit/System Description

Each of the audio output channel circuits (+) and (-), at the radio and audio amplifier have a DC bias voltage that is approximately one half of battery voltage. When using a DMM, each of the audio output channel circuits will measure approximately 6.5 V DC. The audio being played on the system is produced by a varying AC voltage that is centered around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. The frequency (Hz) of the AC voltage signal is directly related to the frequency of the input (audio source playing) to the audio system. Both the DC bias voltage and the AC voltage signals are needed for the audio system to properly produce sound.

Diagnostic Aids

- Improper speaker mounting or loose trim may cause an audible buzz or distortion. Inspect the appropriate speaker and the surrounding interior trim for proper and secure mounting.

  The EL-50334-6 Audio System Diagnostic CD contains audio tracks that can be used to duplicate and isolate such concerns. Tracks 11 and 12 contain audio sweep tones for testing for speaker and grill rattles.

  If the speaker or surrounding interior trim is found to be loose or improperly secured, correctly secure the item.

- The test tones on the CD may be copied to a USB drive or other device to use during testing.
- When equipped with an amplifier, it is possible for some individual circuit faults to affect more than one speakers operation. Perform diagnostic tests in the sequence listed to avoid misdiagnosis.
- On the base 6 speaker system, the subwoofer is not used for reproducing audio. The subwoofer is used only for producing the cancellation tones for the active noise cancellation system.

  On the uplevel speaker system, the subwoofer is used for both reproducing audio and the active noise cancellation system tones.

Circuit/System Verification

1. Ignition ON/vehicle in Service Mode, A11 Radio ON, mute OFF.
2. Verify clear audio is heard from each speaker, adjusting fade and balance controls to test each speaker individually.
    - **If audio is inoperative from one or more speakers, or the audio emitted is not clear**

      Refer to Circuit/System Testing.

    - **If clear audio is heard from all speakers**
3. All OK.

Circuit/System Testing

NOTE: **In the following tests, audio signal frequencies (Hz) will be tested. To prevent misdiagnosis, the door chime must be OFF during testing. Ensure the driver door latch is closed during testing.**

1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the T3 Audio Amplifier.
2. Test for less than 10 Ω between the ground circuit terminal 8 and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF/vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Verify that a test lamp illuminates between the B+ circuit terminal 4 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF/vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, refer to Power Mode Mismatch .
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF/vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the T3 Audio Amplifier.
    - **If the test lamp illuminates**
4. Ignition OFF/vehicle OFF, disconnect the X3 harness connector at the T3 Audio Amplifier.

NOTE: **In the following tests, audio signal frequencies (Hz) will be tested. To prevent misdiagnosis, the door chime must be OFF during testing. Ensure the driver door latch is closed during testing.**

5. Verify a test lamp does not illuminate between the control circuit terminal 8 and ground.
    - **If the test lamp illuminates**

   1. Disconnect the X1 harness at the A11 Radio.
   2. Verify a test lamp does not illuminate between the control circuit and ground.
      - If the test lamp illuminates, repair the short to voltage on the circuit.
      - If the test lamp does not illuminate, replace the A11 Radio.
   - **If the test lamp does not illuminate**
6. Ignition ON/vehicle in Service Mode, A11 Radio ON.
7. Verify a test lamp illuminates between the control circuit terminal 8 and ground.
   - **If the test lamp does not illuminate**
   1. Ignition OFF/vehicle OFF. Disconnect the X1 harness at the A11 Radio.
   2. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the A11 Radio.
   - **If the test lamp illuminates**
8. Radio ON, mute ON.
9. Test for 7.5 - 8.5 V between the control circuit terminal 11 and ground.
   - **If greater than 8.5 V**
   1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the A11 Radio. Ignition ON/vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the A11 Radio.
   - **If less than 7.5 V**
   1. Ignition OFF/vehicle OFF, disconnect the X1 harness connector at the A11 Radio.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the A11 Radio.
   - **If between 7.5 - 8.5 V**
10. Radio ON, mute OFF.
11. Test for less than 1 V between the control circuit terminal 11 and ground.
    - **If greater than 1 V**

      Replace the A11 Radio.

    - **If less than 1 V**
12. Test for 5 - 7 V between the signal circuit terminals listed below and ground:
    - Left front speaker signal (+) terminal 15
    - Left front speaker signal (-) terminal 7
    - Right front speaker signal (+) terminal 14
    - Right front speaker signal (-) terminal 6
    - Left rear speaker signal (+) terminal 13
    - Left rear speaker signal (-) terminal 5
    - Right rear speaker signal (+) terminal 12
    - Right rear speaker signal (-) terminal 4
    - **If less than 5 V**
    1. Ignition OFF/vehicle OFF, disconnect the X2 harness connector at the A11 Radio.
    2. Test for infinite resistance between the signal circuit and ground.
       - If less than infinite resistance, repair the short to ground on the circuit.
       - If infinite resistance

3. Test for less than 2 Ω in the signal circuit end to end.
   - If 2 Ω or greater, repair the open/high resistance in the circuit.
   - If less than 2 Ω, replace the A11 Radio.

- **If greater than 7 V**

1. Ignition OFF/vehicle OFF, disconnect the X2 harness connector at the A11 Radio. Ignition ON/vehicle in Service Mode.
2. Test for less than 1 V between the signal circuit and ground.
   - If 1 V or greater, repair the short to voltage on the circuit.
   - If less than 1 V, replace the A11 Radio.

- **If between 5 - 7 V**

13. Play track number three (50 Hz bass test tone) from the **EL-50344-6** Audio Test CD.
14. Test for 49 - 51 Hz AC between the audio signal circuit terminals listed below and ground:
    - Left front speaker signal (+) terminal 15
    - Left front speaker signal (-) terminal 7
    - Right front speaker signal (+) terminal 14
    - Right front speaker signal (-) terminal 6
    - Left rear speaker signal (+) terminal 13
    - Left rear speaker signal (-) terminal 5
    - Right rear speaker signal (+) terminal 12
    - Right rear speaker signal (-) terminal 4
    - **If not between 49 - 51 Hz AC**

      Replace the A11 Radio.

    - **If between 49 - 51 Hz AC**
15. Ignition OFF/vehicle OFF, connect all harness connectors.
16. Disconnect the harness connector at the appropriate P19 Speaker. Ignition ON/vehicle in Service Mode, A11 Radio ON.
17. Test for 5 - 7 V between the appropriate P19 Speaker circuits listed below and ground:
    - Speaker signal (-) circuit terminal 1
    - Speaker signal (+) circuit terminal 2
    - **If less than 5 V**

    1. Ignition OFF/vehicle OFF, disconnect the X1 and X2 harness connector at the T3 Audio Amplifier.
    2. Test for infinite resistance between the signal circuit and ground.
       - If less than infinite resistance, repair the short to ground on the circuit.
       - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
       - If 2 Ω or greater, repair the open/high resistance in the circuit.
       - If less than 2 Ω, replace the T3 Audio Amplifier.

    - **If greater than 7 V**

    1. Ignition OFF/vehicle OFF, disconnect the X1 and X2 harness connector at the T3 Audio Amplifier. Ignition ON/vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
       - If 1 V or greater, repair the short to voltage on the circuit.
       - If less than 1 V, replace the T3 Audio Amplifier.

    - **If between 5 - 7 V**
18. Mute OFF, play track number three (50 Hz bass test tone) from the test CD.
19. Test for 49 - 51 Hz AC between the appropriate P19 Speaker circuits listed below and ground:
    - Speaker signal (-) circuit terminal 1
    - Speaker signal (+) circuit terminal 2
    - **If not between 49 - 51 Hz AC**

Replace the T3 Audio Amplifier.

- **If between 49 - 51 Hz AC**

20. Test or replace the P19 Speaker.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Speaker Replacement Reference**
- Refer to **Control Module References** for amplifier or radio replacement, programming, and setup

SPEAKER MALFUNCTION (WITHOUT UQA)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left Front Speaker Output Signal	1	1	1, 2	-
Right Front Speaker Output Signal	1	1	1, 2	-
Left Rear Speaker Output Signal	1	1	1, 2	-
Right Rear Speaker Output Signal	1	1	1, 2	-
1. No or reduced audio from speaker(s) on the affected audio circuit. 2. Noticeable audio distortion may be present.				

Circuit/System Description

Each of the audio output channel circuits (+) and (-), at the radio have a DC bias voltage that is approximately one half of battery voltage. When using a DMM, each of the audio output channel circuits will measure approximately 6.5 V DC. The audio being played on the system is produced by a varying AC voltage that is centered around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. The frequency (Hz) of the AC voltage signal is directly related to the frequency of the input (audio source playing) to the audio system. Both the DC bias voltage and the AC voltage signals are needed for the audio system to properly produce sound.

Diagnostic Aids

- Improper speaker mounting or loose trim may cause an audible buzz or distortion. Inspect the appropriate speaker and the surrounding interior trim for proper and secure mounting.
- The EL-50334-6 Audio System Diagnostic CD contains audio tracks that can be used to duplicate and isolate such concerns. Tracks 11 and 12 contain audio sweep tones for testing for speaker and grill rattles.
- The test tones on the CD may be copied to a USB drive or other device to use during testing.
- If the speaker or surrounding interior trim is found to be loose or improperly secured, correctly secure the item.
- If equipped with an Active Noise Cancellation system that utilizes an ANC module, the module acts as a pass-through for the high level audio signals from the radio to the speakers.

Circuit/System Verification

1. Ignition ON/vehicle in Service Mode, A11 Radio ON, mute OFF.
2. Verify clear audio is heard from each speaker, adjusting fade and balance controls to test each speaker individually.
   - **If audio is inoperative from one or more speakers, or the audio emitted is not clear.**

     Refer to Circuit/System Testing.

   - **If clear audio is heard from all speakers.**
3. All OK.

Circuit/System Testing

NOTE: **Some circuits supply audio signals to more than one speaker. It may be necessary to disconnect all speakers on the affected audio circuit when performing circuit tests.**

1. Ignition OFF/vehicle OFF, disconnect the harness connector at the appropriate P19 Speaker. Ignition ON, A11 Radio ON, mute OFF.
2. Test for 5 - 7 V between each audio signal circuit terminal 1 and terminal 2 and ground.
   - **If less than 5 V**
   1. Ignition OFF/vehicle OFF, disconnect the appropriate speaker harness connector at the A11 Radio.
   2. Test for infinite resistance between the signal circuits and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the A11 Radio.
   - **If greater than 7 V**
   1. Ignition OFF/vehicle OFF, disconnect the appropriate speaker harness connector at the A11 Radio. Ignition ON/vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the A11 Radio.
   - **If between 5 - 7 V**
3. Test or replace the P19 Speaker.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Speaker Replacement Reference**
- Refer to **Control Module References** for radio replacement, programming, and setup.

DTC Descriptors

DTC B2470 02

Cellular Phone Antenna Circuit Malfunction Short to Ground

DTC B2470 04

Cellular Phone Antenna Circuit Malfunction Open Circuit

Circuit/System Description

The primary cellular phone antenna element is connected to the telematics communication interface control module (violet connector) via a shielded coaxial cable. Cellular communication takes place on both the primary cellular antenna signal circuit and the GPS/secondary cellular antenna signal circuit. This diagnostic only applies to the primary cellular antenna signal circuit. Internal to the antenna on the cellular antenna signal circuit resistance is used to apply a load, which the telematics communication interface control module uses to detect the presence of the antenna.

Conditions for Running the DTC

- Ignition in the RUN or ACC position.
- System voltage is between 9.5 V and 15.5 V.
- The above conditions are present for greater than 1 s.

Conditions for Setting the DTC

B2470 02

The telematics communication interface control module detects a short to ground on the primary cellular antenna signal circuit.

B2470 04

- The telematics communication interface control module detects an open or high resistance on the primary cellular antenna signal circuit.
- The above conditions are present for greater than 1 s.

Action Taken When the DTC Sets

The OnStarÃ‚Â® status LED turns red.

Conditions for Clearing the DTC

- The telematics communication interface control module detects the presence of a cellular antenna.
- A history DTC clears after 50 malfunction-free ignition cycles.

EL-49903-1 Test Antenna Navn-Cell Comn

Circuit/System Testing

NOTE:

- **The vehicle may be equipped with sectioned coax. Test each section and replace only the faulty section, not the entire length of coax.**
- **The following verification requires the vehicle to be outside with an unobstructed view of the southern sky. Allow 5 min after turning the ignition ON for the GPS satellites to acquire vehicle signal.**

1. Ignition OFF/Vehicle OFF and all vehicle systems OFF, disconnect the violet primary cellular coax cable connector at the K73 Telematics Communication Interface Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Using the **EL-49903-1** Test Antenna Navn-Cell Comn connect the violet coax cable to the K73 Telematics Communication Interface Control Module. Place the test antenna on the roof of the vehicle, ignition ON/vehicle in Service Mode.
3. Verify the DTC does not set or a call can be completed to the OnStar Call Center while operating the vehicle within the conditions for running the DTC.
    - **If the DTC sets or a call can not be completed to the OnStar Call Center**

      Replace the K73 Telematics Communications Interface Control Module.

    - **If the DTC does not set or a call can be completed to the OnStar Call Center**
4. Ignition OFF/Vehicle OFF.
5. Disconnect the **EL-49903-1** Test Antenna Navn-Cell Comn from the K73 Telematics Communication Interface Control Module
6. Test the coax cable. Refer to Component Testing.
    - **If the coax cable does not pass the test**

      Replace the coax cable.

    - **If the coax cable passes the test**
7. Test or replace the T2RR Antenna - Roof Rear.

Component Testing

CAUTION: **Refer to Test Probe Caution**

NOTE:

- **Before testing the coax cable, check the cable exterior for being pinched, cut, damaged, or having loose connections at the components, which can cause**

reception issues.
- **To prevent false readings when testing the center coax terminals, use care not to ground the test probe on the outer housing/shield.**

Coax Cable Test

1. Test for less than 5 Ω between the coax cable center terminal end to end.
   - **If 5 Ω or greater**

     Replace the coax cable.
   - **If less than 5 Ω**
2. Test for greater than 5 Ω between the coax cable outer shield end to end.
   - **If 5 Ω or greater**

     Replace the coax cable.
   - **If less than 5 Ω**
3. Test for infinite resistance between the coax cable center terminal and the coax cable outer shield.
   - **If less than infinite resistance**

     Replace the coax cable.
   - **If infinite resistance**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair procedure.

- Refer to **High Frequency Antenna Replacement**
- Refer to **Control Module References** for telematics communication interface control module replacement, setup, and programming

ONSTAR VOICE RECOGNITION MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

The telematics communication interface control module is capable of interpreting voice commands received over the cellular microphone circuits. Speech recognition allows the user to speak to one computer in the vehicle, and one reached over the cellular communication network. The module attempts to understand the users command, and responds by speaking back, or by taking the appropriate action, e.g. dialing the phone.

REPAIR INSTRUCTIONS

MOBILE TELEPHONE MICROPHONE REPLACEMENT

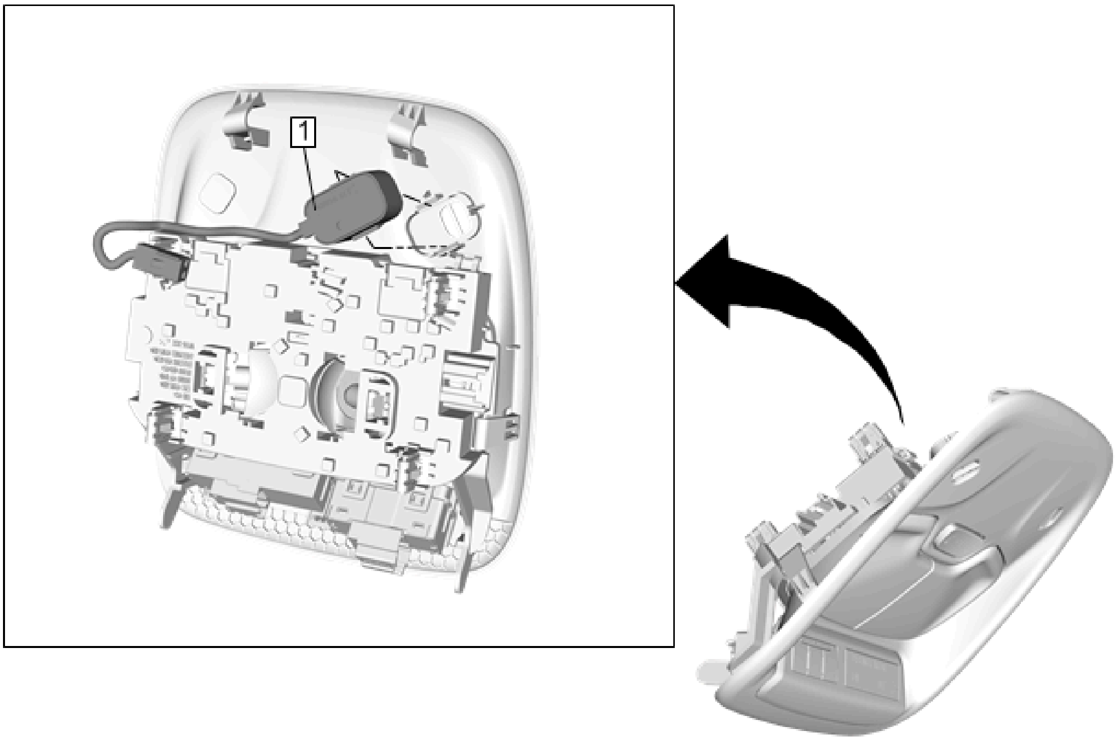

Fig. 12: Mobile Telephone Microphone
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Roof Console. Refer to Roof Console Replacement	
1	Mobile Telephone Microphone **Procedure** Release the retaining tabs.

COMMUNICATION CENTER CALL SWITCH REPLACEMENT

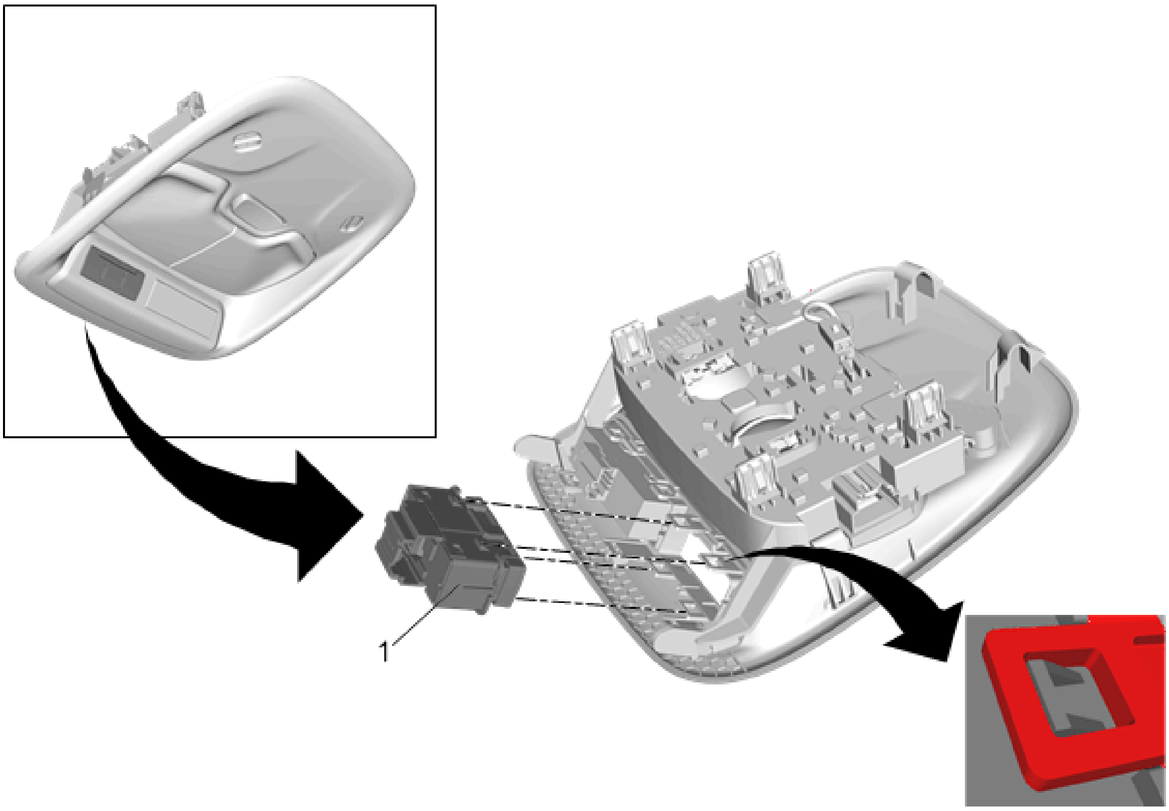

Fig. 13: Communication Center Call Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
Preliminary Procedures 1. Disconnect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection 2. Remove Roof Console. Refer to Roof Console Replacement	
1	Communication Center Call Switch **Procedure** 1. Use a flat bladed plastic tool to remove. 2. Release tabs and remove the switch from the roof console. 3. Connect the battery negative cable. Refer to Battery Negative Cable Disconnection and Connection

COMMUNICATION INTERFACE MODULE REPLACEMENT

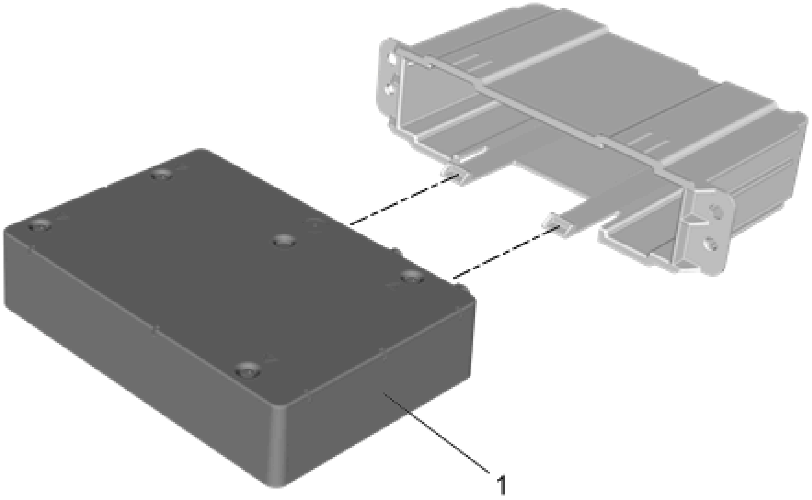

Fig. 14: Communication Interface Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Communication Interface Module Bracket. Refer to Communication Interface Module Bracket Replacement	
1	Communication Interface Module **Procedure** 1. Push the retaining tabs (Qty: 2) outward and slide the module upward. 2. Refer to Control Module References for programming and setup information, if required.

COMMUNICATION INTERFACE MODULE BATTERY REPLACEMENT

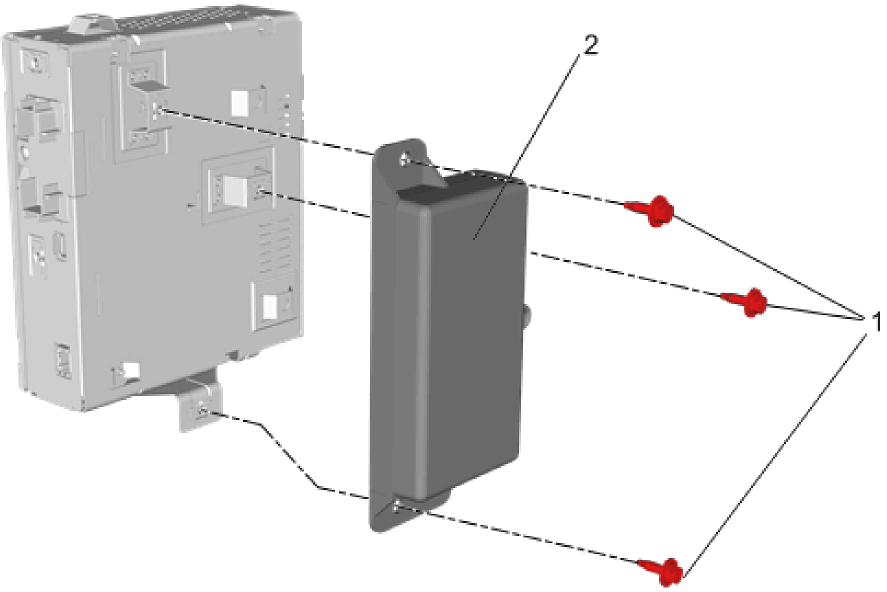

Fig. 15: Communication Interface Module Battery
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the radio. Refer to Radio Replacement	
1	Communication Interface Module Battery Bolt (Qty: 3) **CAUTION:** **Refer to Fastener Caution** **Tighten** 2.5 N.m (22 lb in)
2	Communication Interface Module Battery

COMMUNICATION INTERFACE MODULE BRACKET REPLACEMENT

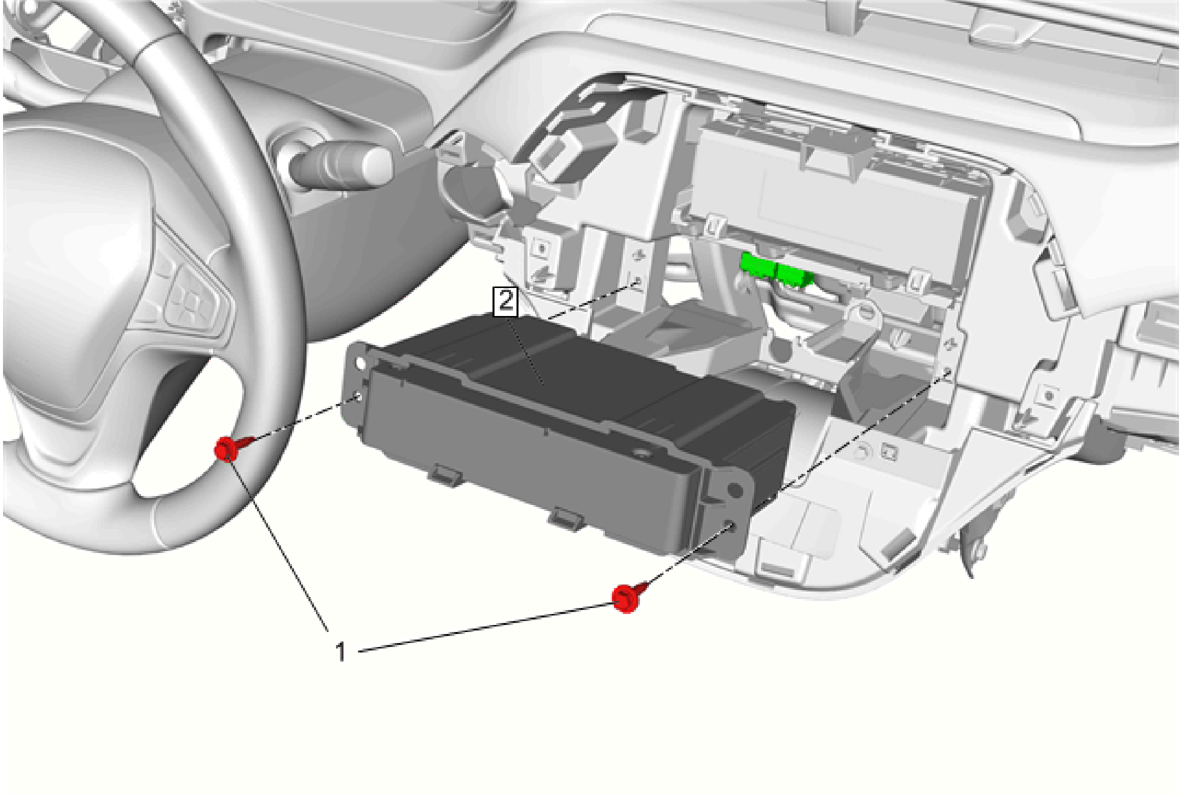

Fig. 16: Communication Interface Module Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Instrument Panel Trim Plate. Refer to **Instrument Panel Trim Plate Replacement**	
1	Communication Interface Module Bracket Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Communication Interface Module Bracket **Procedure** 1. Disconnect all electrical connectors. 2. Transfer components as necessary.

RADIO REPLACEMENT

Removal Procedure

1. Disconnect Battery Negative Cable. Refer to **Battery Negative Cable Disconnection and Connection**

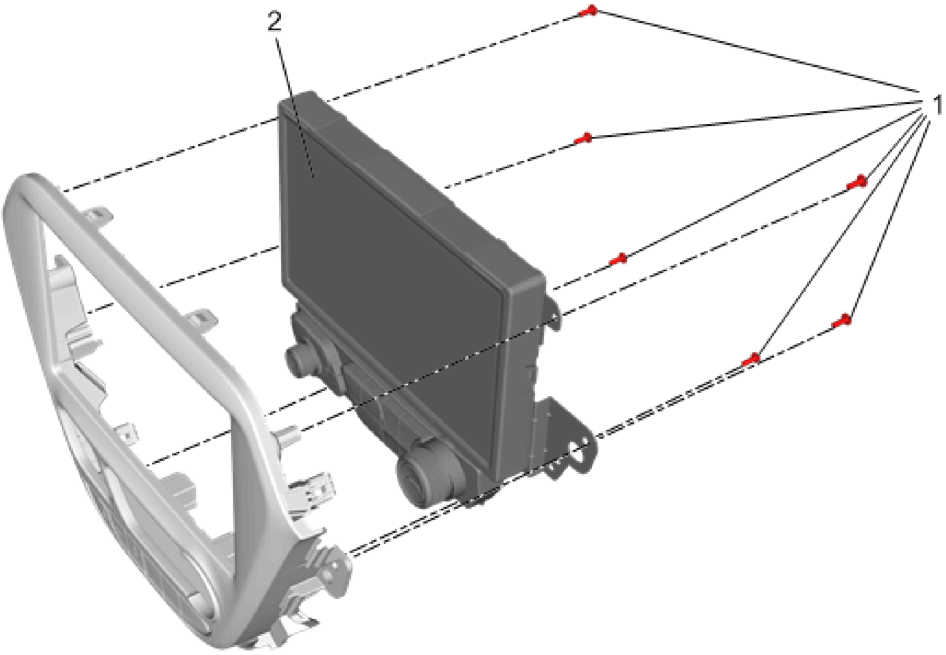
15. Install Instrument Panel Assembly (1). Refer to **Instrument Panel Assembly Replacement**
16. Connect Battery Negative Cable. Refer to **Battery Negative Cable Disconnection and Connection**

DRIVER INFORMATION DISPLAY REPLACEMENT



[Fig. 33: Driver Information Display](#)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Instrument Panel Trim Plate. Refer to **Instrument Panel Trim Plate Replacement**	
1	Driver Information Display Bolt (Qty: 6) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Driver Information Display **Procedure** 1. Transfer components as necessary. 2. Refer to **Control Module References** for programming and setup procedures, if required.

AUDIO DISC PLAYER AND USB RECEPTACLE REPLACEMENT

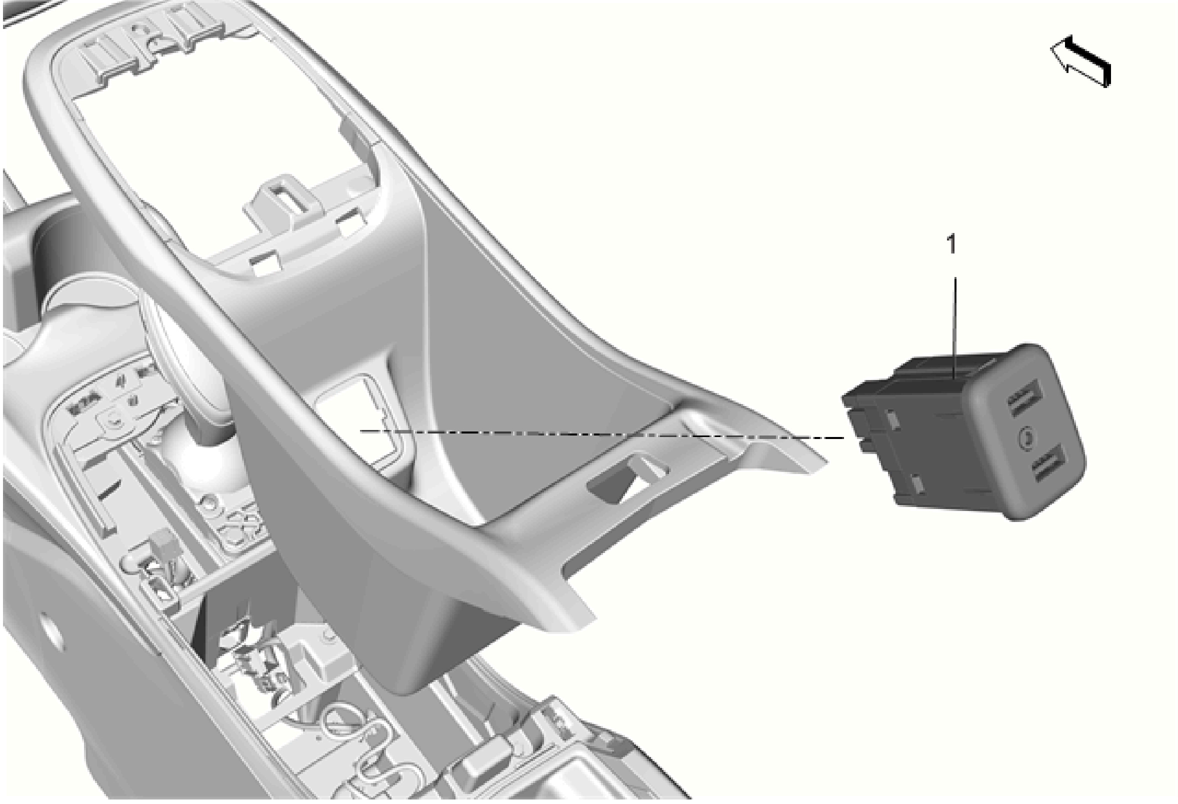


Fig. 34: Audio Disc Player and USB Receptacle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Floor Console Stowage Tray. Refer to Rear Floor Console Stowage Tray Replacement (without K4C) Rear Floor Console Stowage Tray Replacement (with K4C)	
1	Audio Disc Player and USB Receptacle **Procedure** Use a flat bladed plastic trim tool.

RADIO SPEAKER AMPLIFIER REPLACEMENT

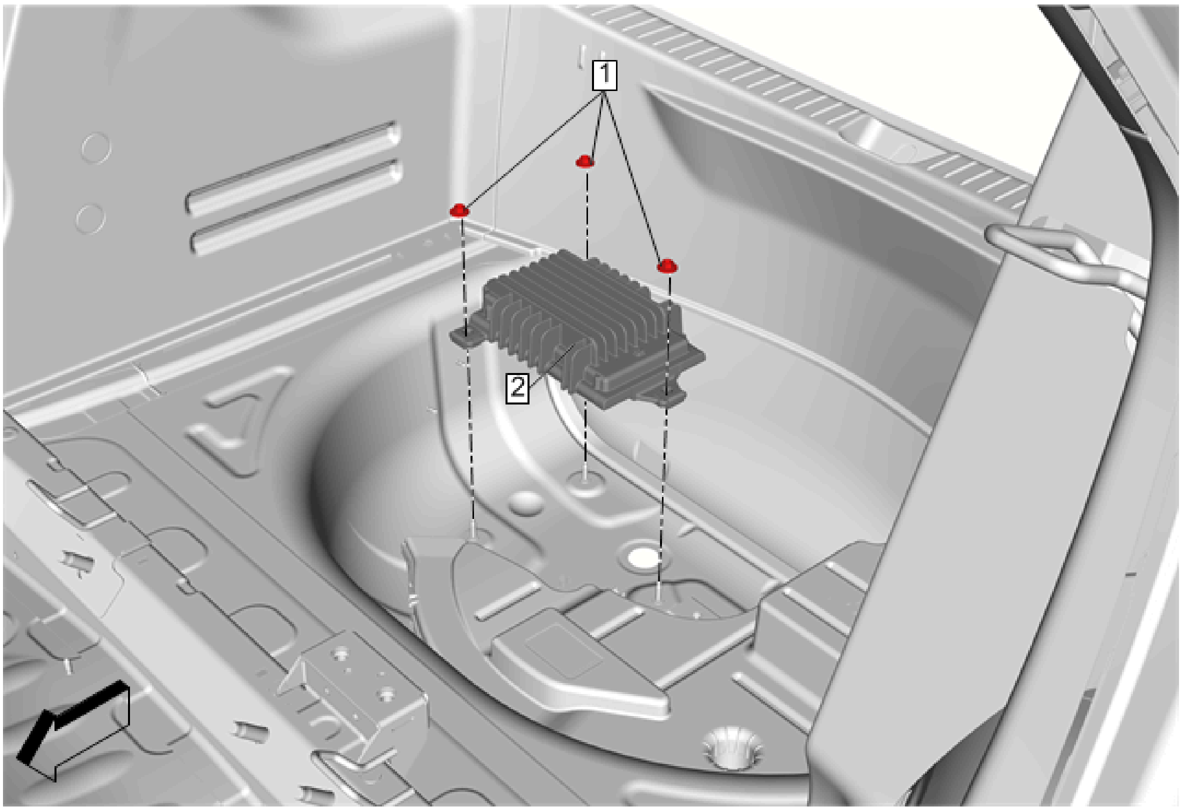

Fig. 35: Radio Speaker Amplifier
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Load Floor Trim Panel. Refer to **Load Floor Trim Panel Replacement**	
1	Radio Speaker Amplifier Nut (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)
2	Radio Speaker Amplifier **Procedure** 1. Disconnect all electrical connectors. 2. Refer to **Control Module References** for programming and setup information, if required.

RADIO ANTENNA AMPLIFIER REPLACEMENT

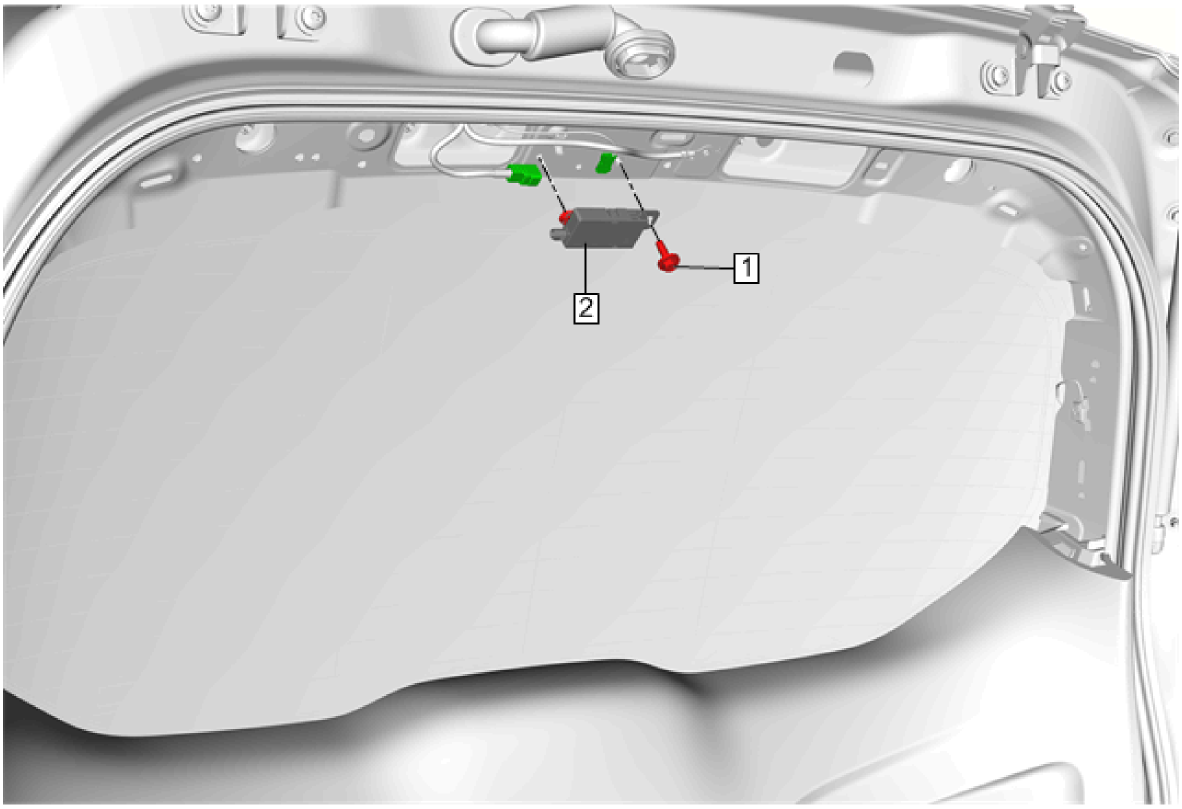

Fig. 36: Radio Antenna Amplifier
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Liftgate Upper Center Trim Finish Panel. Refer to **Liftgate Upper Center Trim Finish Panel Replacement**	
1	Radio Antenna Amplifier Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)

Callout	Component Name
2	Radio Antenna Amplifier **Procedure** 1. Disconnect the electrical connectors. 2. Release the integral retainer using an appropriate trim tool.

ROOF ACCESSORY RADIO ANTENNA CABLE REPLACEMENT

Removal Procedure

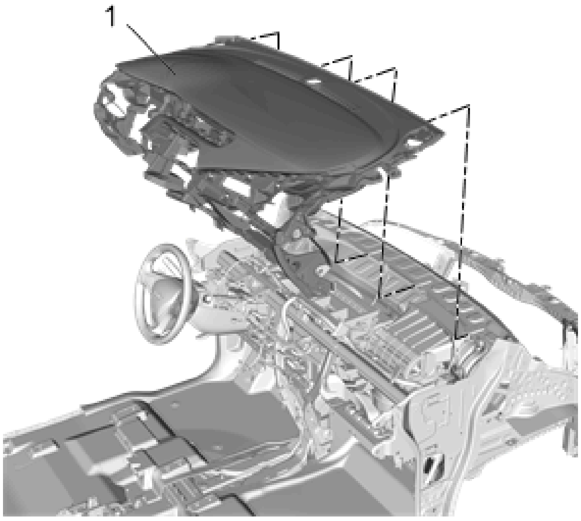

Fig. 37: Instrument Panel Assembly
Courtesy of GENERAL MOTORS COMPANY

1. Remove Instrument Panel Assembly (1). Refer to Instrument Panel Assembly Replacement

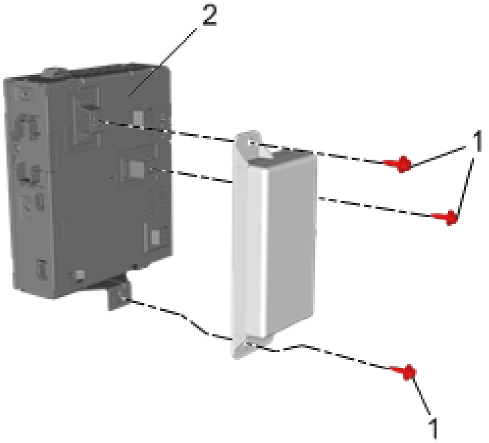

Fig. 38: Radio Assembly And Bolts
Courtesy of GENERAL MOTORS COMPANY

2. Remove Radio (2). Refer to Radio Replacement

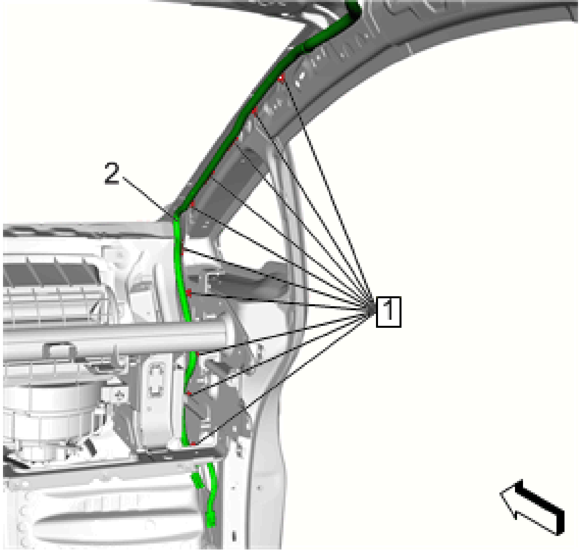

Fig. 39: Roof Accessory Radio Antenna Cable And Retaining Clips
Courtesy of GENERAL MOTORS COMPANY

3. Detach the cable retaining clips (1) from the vehicle.
4. Remove the roof accessory radio antenna cable (2).

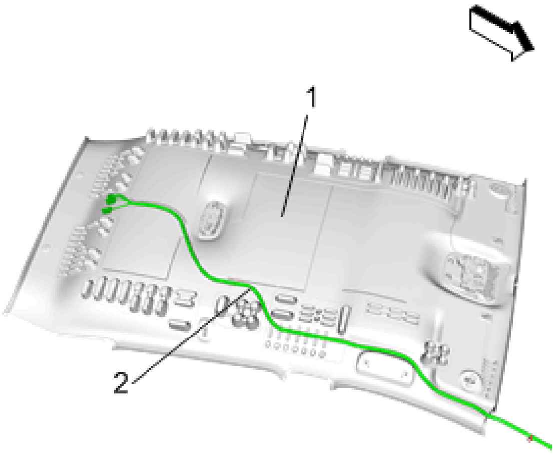

Fig. 40: Roof Accessory Radio Antenna Cable And Headlining Trim Panel

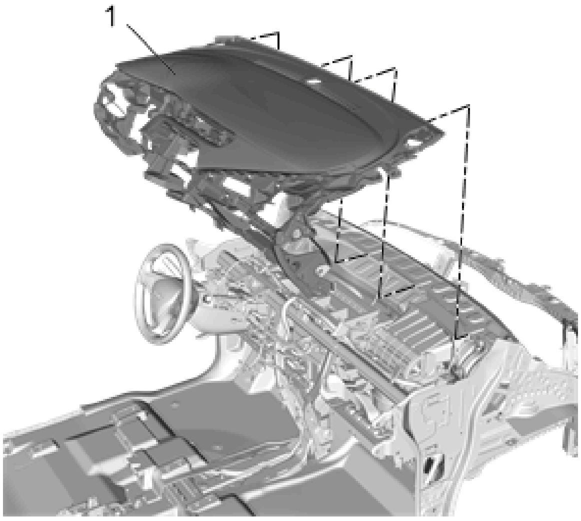
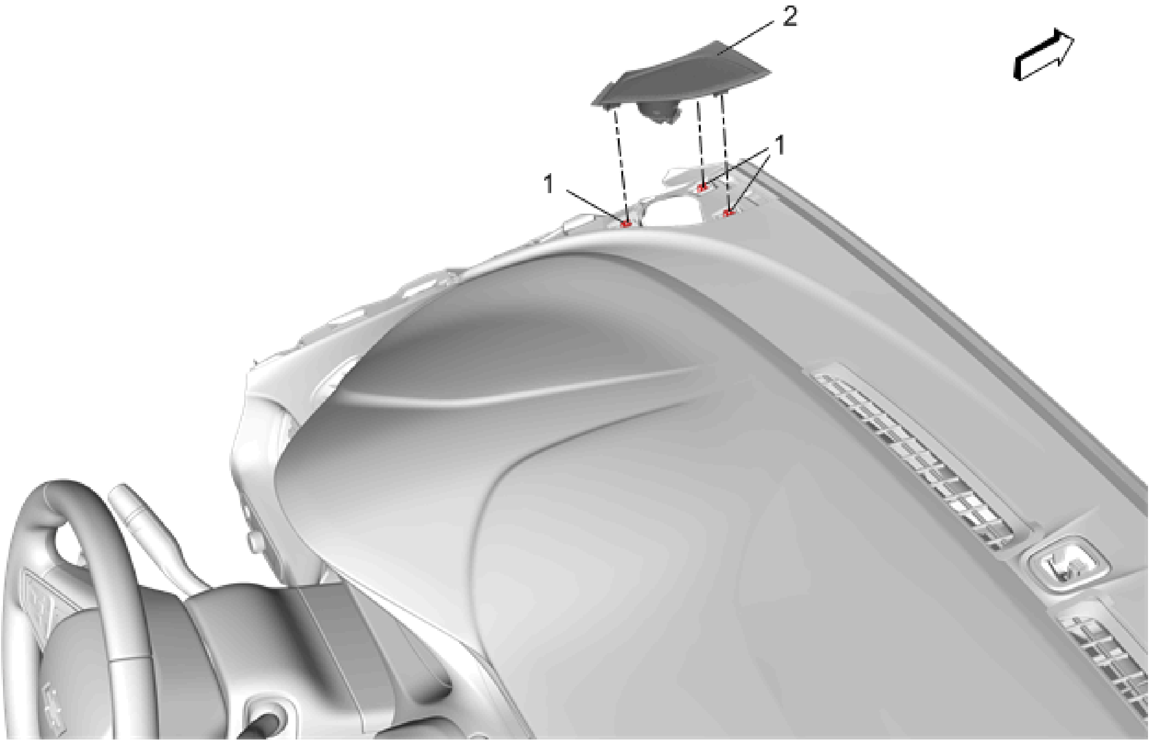
5. Install Radio (2). Refer to **Radio Replacement**



[Fig. 44: Instrument Panel Assembly](#)
Courtesy of GENERAL MOTORS COMPANY

6. Install Instrument Panel Assembly (1). Refer to [Instrument Panel Assembly Replacement](#)

RADIO FRONT SPEAKER GRILLE REPLACEMENT



[Fig. 45: Radio Front Speaker Grille](#)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Windshield Garnish Molding. Refer to [Windshield Garnish Molding Replacement](#)	
1	Radio Front Speaker Grille Clip (Qty: 3)
2	Radio Front Speaker Grille **Procedure** 1. Use a flat bladed plastic tool to remove. 2. Disconnect the electrical connector. 3. Transfer components as necessary.

RADIO WINDSHIELD SIDE GARNISH MOLDING SPEAKER REPLACEMENT

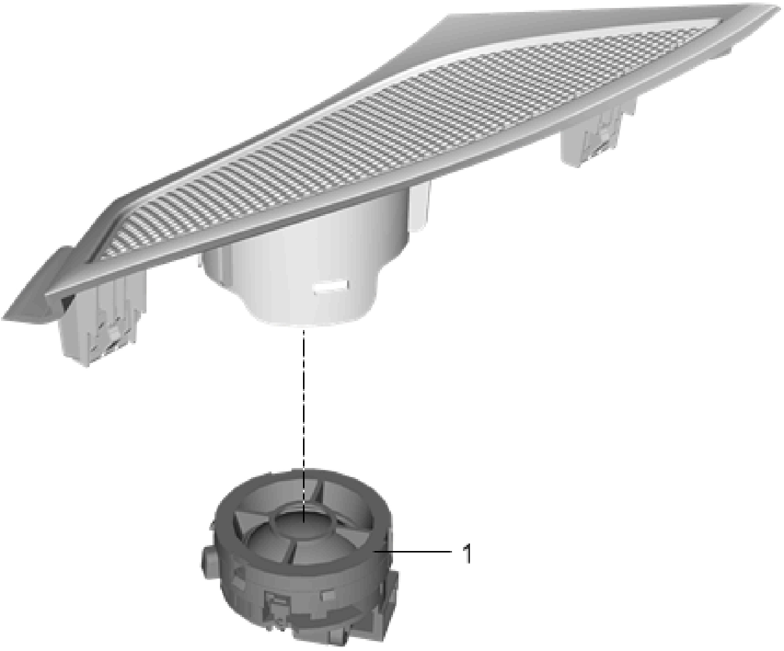


Fig. 46: Radio Windshield Side Garnish Molding Speaker
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Radio Front Speaker Grille. Refer to **Radio Front Speaker Grille Replacement**	
1	Radio Windshield Side Garnish Molding Speaker **Procedure** 1. Use a flat bladed plastic trim tool. 2. Release the retaining tabs.

HIGH FREQUENCY ANTENNA REPLACEMENT

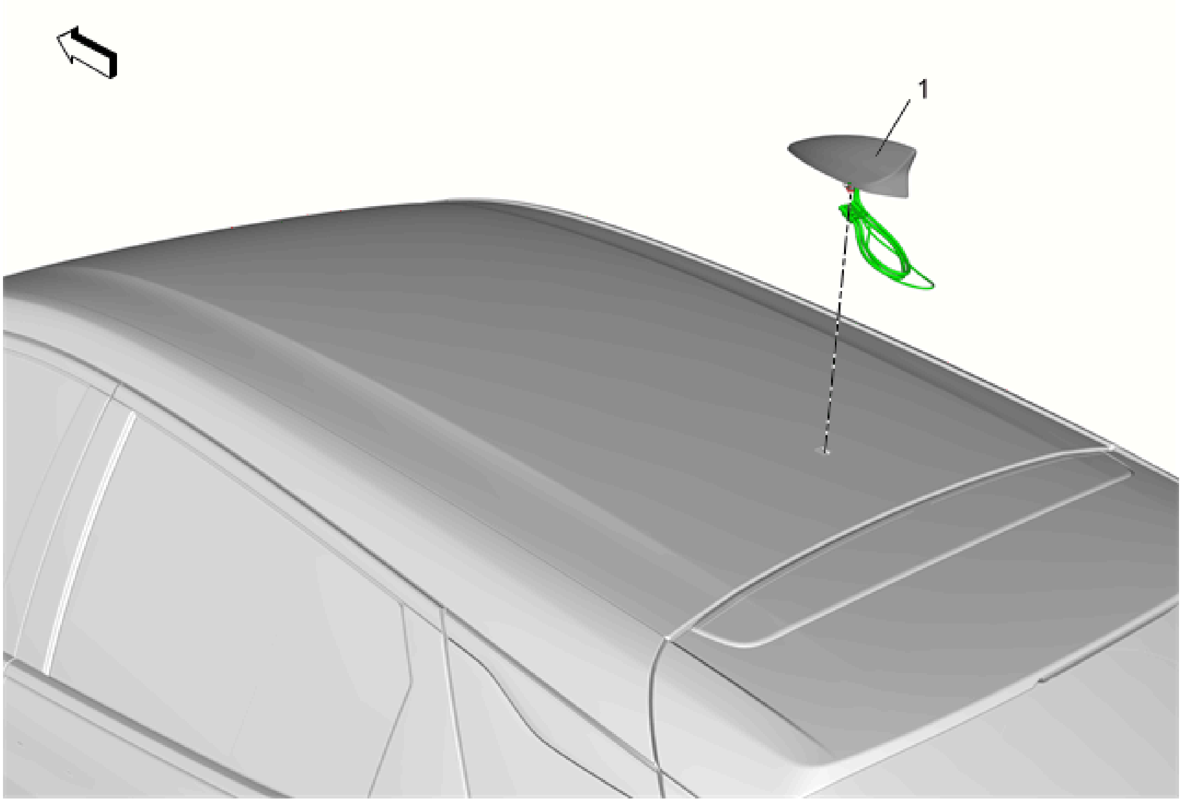

Fig. 47: High Frequency Antenna
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Lower the headlining trim panel. Refer to Headlining Trim Panel Replacement **NOTE:** **Only perform those steps that will lower the headlining trim panel enough to gain access to the part.**	
1	High Frequency Antenna **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Remove the bolt. 2. Disconnect the electrical connectors. 3. Disconnect the antenna cables. 4. Release the retaining features and feed the wiring and cable up through the hole in the roof panel. 5. Ensure that the antenna is straight while tightening. **Tighten** 9 N.m (80 lb in)

RADIO FRONT SIDE DOOR SPEAKER REPLACEMENT

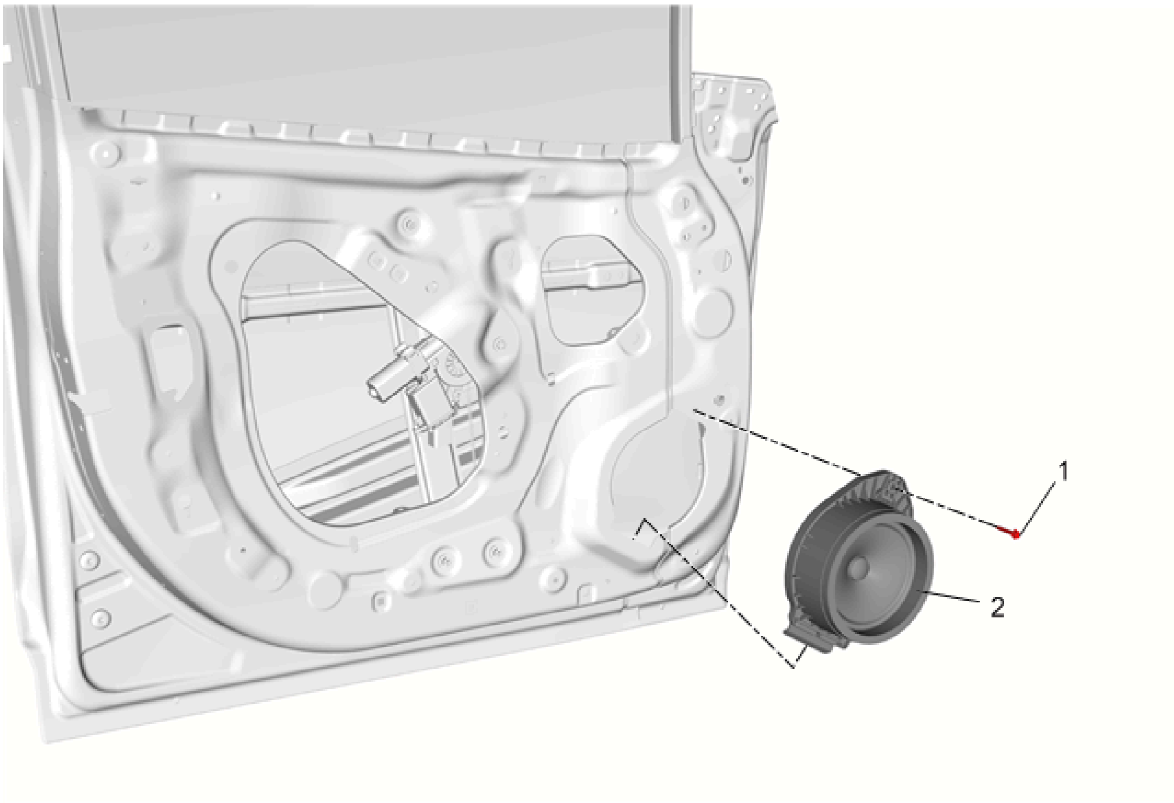

Fig. 48: Radio Front Side Door Speaker
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Front Side Door Trim. Refer to Front Side Door Trim Replacement	

Callout	Component Name
1	Radio Front Side Door Speaker Fastener **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Radio Front Side Door Speaker **Procedure** 1. Disconnect the electrical connector. 2. Unclip and reposition the wiring harness.

RADIO CONTROL SWITCH REPLACEMENT - STEERING WHEEL (LEFT SIDE LOWER)

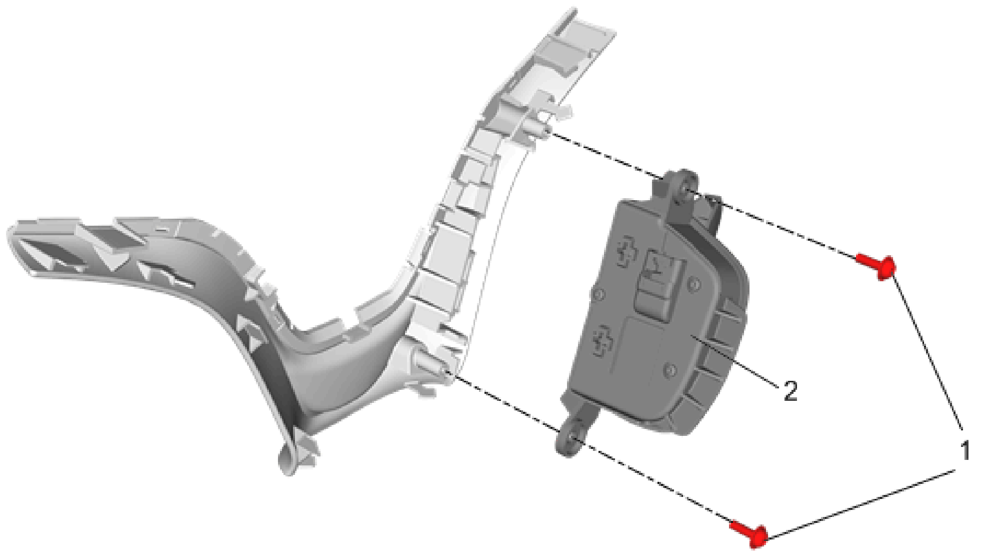

Fig. 49: Radio Control Switch - Steering Wheel (Left Side Lower)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Remove Steering Wheel Spoke Cover. Refer to Steering Wheel Spoke Cover Replacement 2. Remove Steering Wheel Spoke Lower Cover. Refer to Steering Wheel Spoke Lower Cover Replacement	
1	Radio Control Switch Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 1.5 N.m (13 lb in)
2	Radio Control Switch

RADIO CONTROL SWITCH REPLACEMENT - STEERING WHEEL (LEFT SIDE REAR)

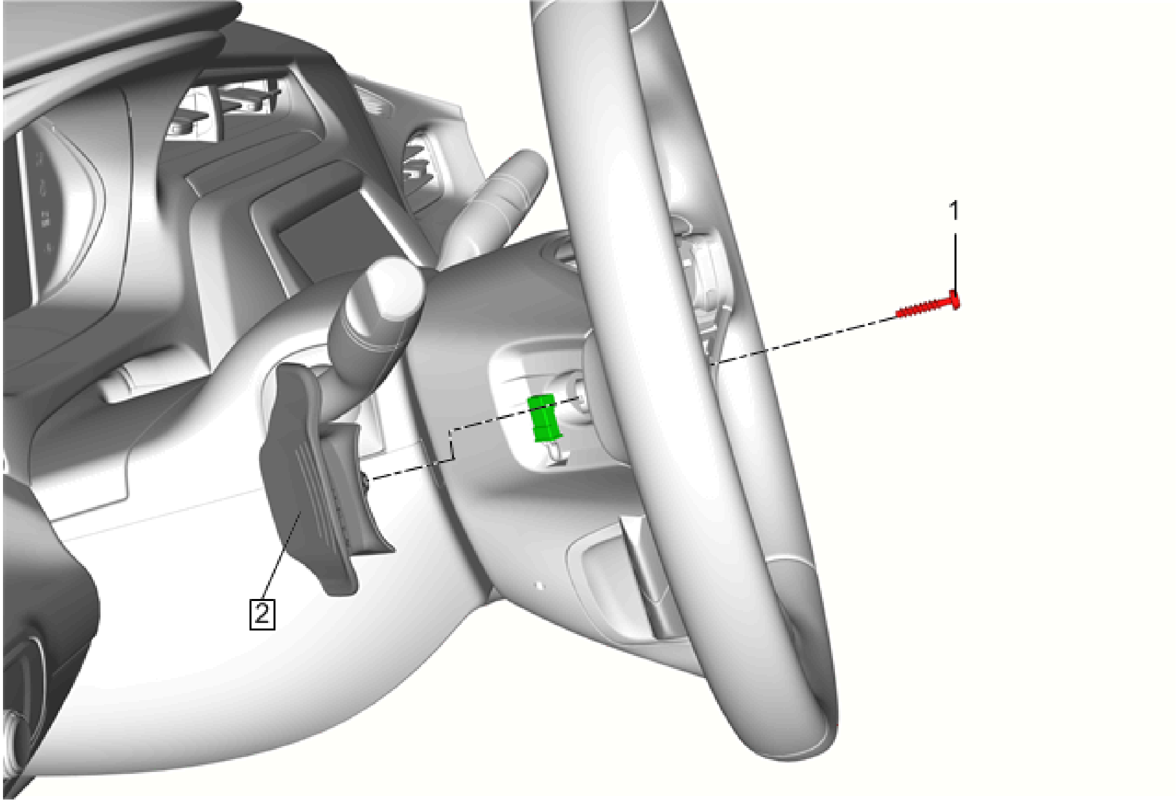

Fig. 50: Radio Control Switch - Steering Wheel (Left Side Rear)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Steering Wheel Spoke Cover. Refer to Steering Wheel Spoke Cover Replacement	
1	Radio Control Switch Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Radio Control Switch **Procedure** Disconnect the electrical connector.

RADIO CONTROL SWITCH REPLACEMENT - STEERING WHEEL (RIGHT SIDE FRONT)

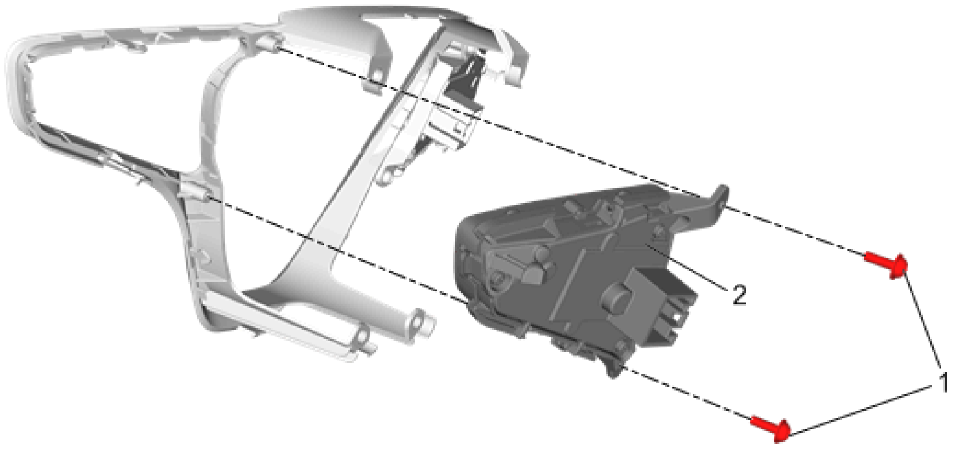

Fig. 51: Radio Control Switch - Steering Wheel (Right Side Front)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Steering Wheel Spoke Cover. Refer to Steering Wheel Spoke Cover Replacement	
1	Radio Control Switch Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 1.5 N.m (13 lb in)
2	Radio Control Switch **Procedure** Remove the radio control switch from the steering wheel spoke cover.

RADIO CONTROL SWITCH REPLACEMENT - STEERING WHEEL (RIGHT SIDE REAR)

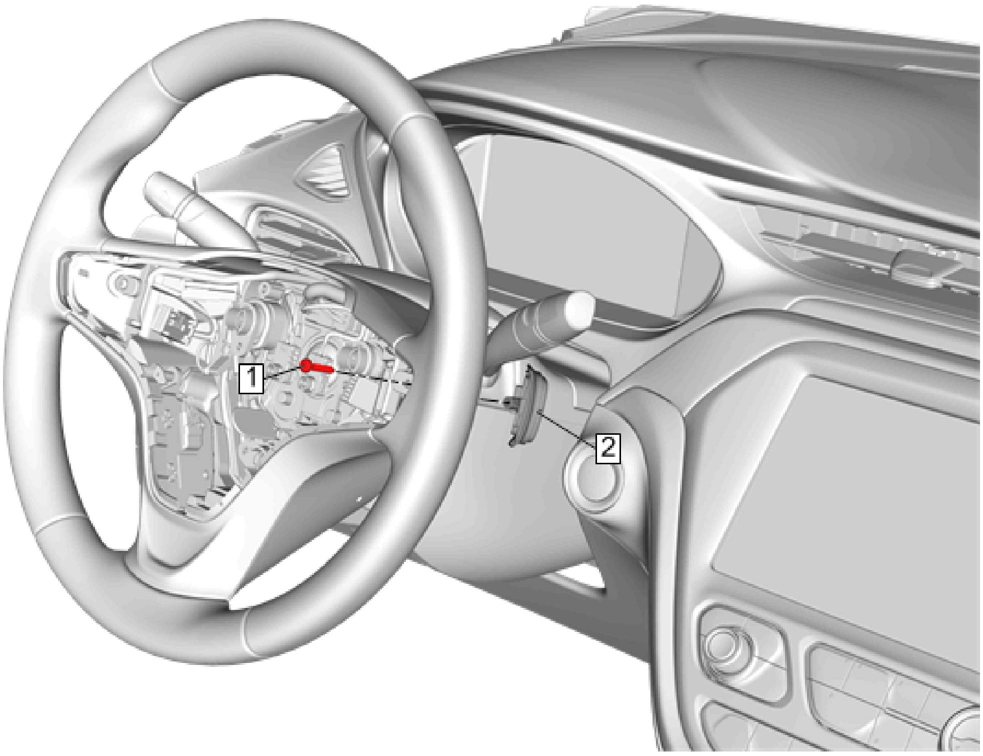

Fig. 52: Radio Control Switch - Steering Wheel (Right Side Rear)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Steering Wheel Spoke Cover. Refer to Steering Wheel Spoke Cover Replacement	
1	Radio Control Switch Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Radio Control Switch **Procedure** Disconnect the electrical connector.

RADIO REAR SIDE DOOR SPEAKER REPLACEMENT

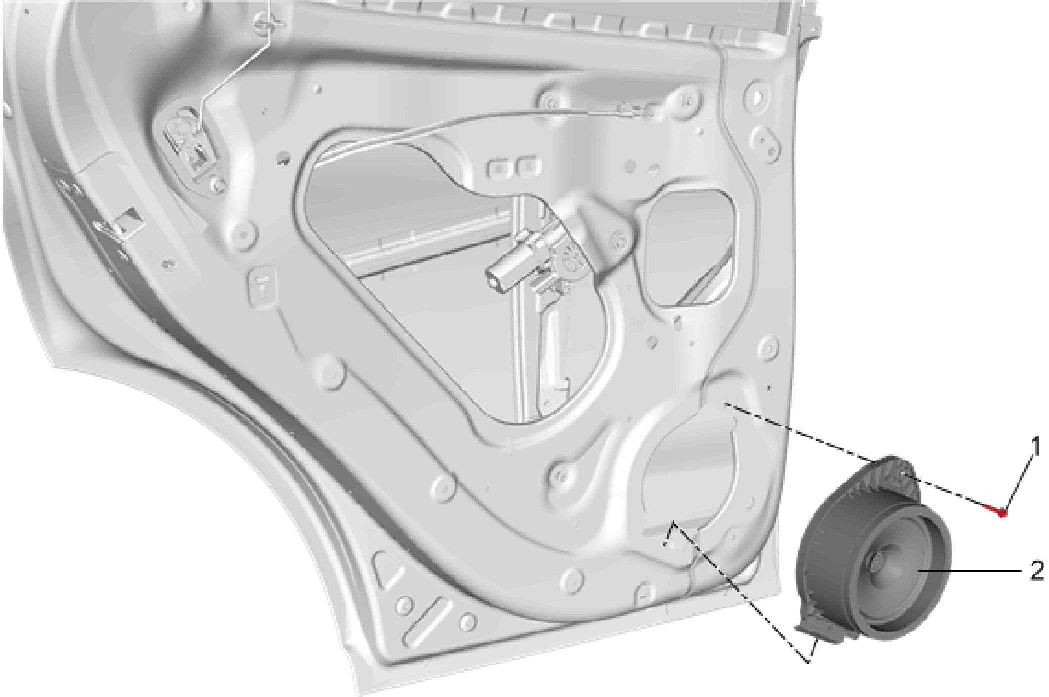

Fig. 53: Radio Rear Side Door Speaker
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Rear Side Door Trim. Refer to Rear Side Door Trim Replacement	
1	Radio Rear Side Door Speaker Fastener **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Radio Rear Side Door Speaker **Procedure** Disconnect the electrical connector.

RADIO REAR COMPARTMENT SPEAKER REPLACEMENT

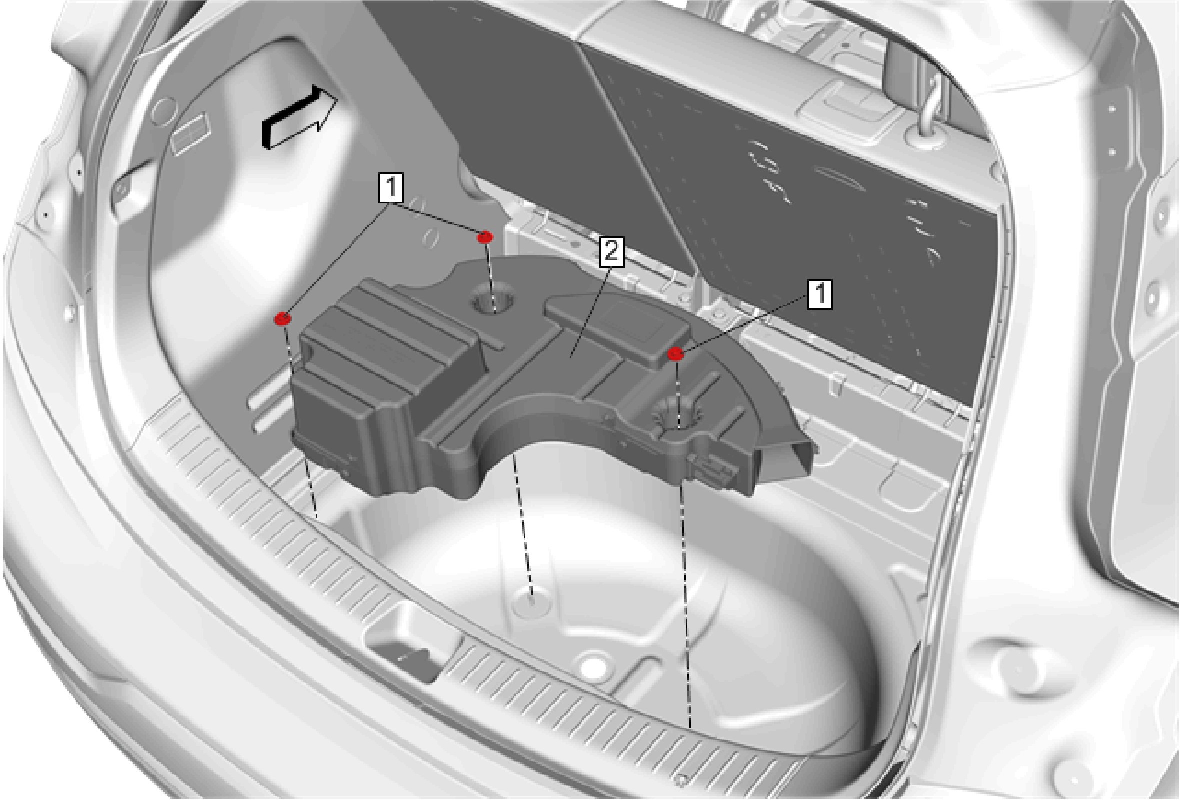

Fig. 54: Radio Rear Compartment Speaker
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Load Floor Trim Panel. Refer to Load Floor Trim Panel Replacement	
1	Radio Rear Compartment Speaker Fastener (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 6 N.m (53 lb in)
2	Radio Rear Compartment Speaker **Procedure** 1. Unclip the wiring harness. 2. Disconnect the electrical connector. 3. Transfer components as necessary.

INSTRUMENT PANEL CENTER ACCESSORY FUNCTION SWITCH REPLACEMENT

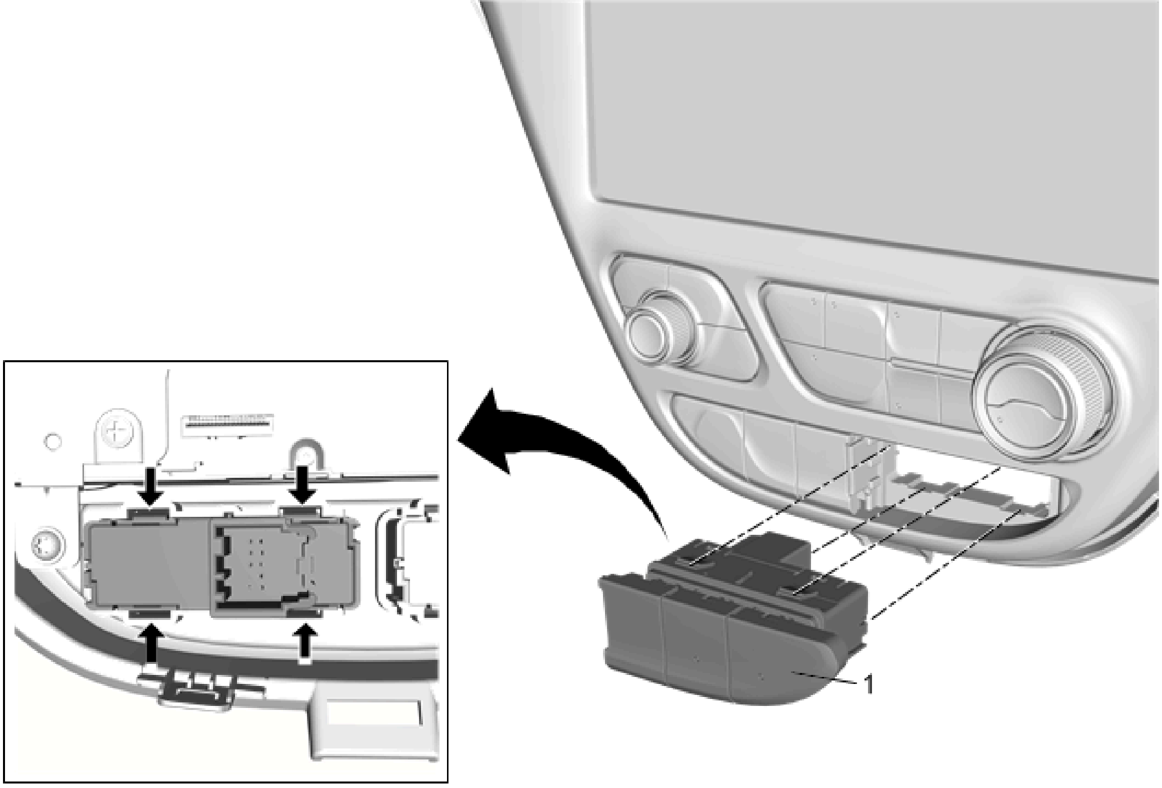

Fig. 55: Instrument Panel Center Accessory Function Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove Instrument Panel Trim Plate. Refer to **Instrument Panel Trim Plate Replacement**	
1	Instrument Panel Center Accessory Function Switch **Procedure** Release the tabs and remove the switch.

DESCRIPTION AND OPERATION

ONSTAR DESCRIPTION AND OPERATION (UE3)

This OnStarÃ‚Â® system consists of the following components:

- Telematics communication interface control module
- OnStarÃ‚Â® three button assembly
- Microphone
- Cellular antenna
- Navigation antenna
- Back up battery (If equipped)

This system also interfaces with the factory installed vehicle audio system.

Telematics Communication Interface Control Module

The telematics communication interface control module is a cellular device that allows the user to communicate data and voice signals over the national cellular network. Power is provided by a dedicated, fused B+ circuit. Ground is provided through the vehicle wiring harness attached to the module. The ignition state is determined by the telematics communication interface control module through serial data messaging.

Dedicated circuits are used to connect the telematics communication interface control module to a microphone, the button assembly, and to command the status LED. The telematics communication interface control module communicates with the rest of the vehicle over the serial data bus.

The module houses 2 technology systems, one to process GPS data, and another for cellular information. The cellular system connects the OnStarÃ,Â® system to the cellular carrier's communication system by interacting with the national cellular infrastructure. The module sends and receives all cellular communications over the cellular antenna and cellular antenna coax. GPS satellites orbiting earth are constantly transmitting signals of their current location. The OnStarÃ,Â® system uses the GPS signals to provide location on demand.

The module also has the capability of activating the horn, initiating door lock/unlock, or activating the exterior lamps using the serial data circuits. These functions can be commanded by the OnStarÃ,Â® Call Center per a customer request.

OnStarÃ,Â® Three Button Assembly

The OnStarÃ,Â® button assembly may be part of the rearview mirror, or a separate, stand alone unit. The button assembly is comprised of 3 buttons and a status LED. The buttons are defined as follows:

- The answer/end call button, which is black with a white phone icon, allows the user to answer and end calls or initiate speech recognition.
- The blue OnStarÃ,Â® call center button, which displays the OnStarÃ,Â® logo, allows the user to connect to the OnStarÃ,Â® call center.
- The emergency button, which displays a white cross with a red background, sends a high priority emergency call to the OnStarÃ,Â® call center when pressed.

The telematics communication interface control module supplies 10 volts to the OnStarÃ,Â® button assembly on the keypad supply voltage circuit. When pressed, each button completes a circuit across a resistor allowing a specific voltage to be returned to the telematics communication interface control module on the keypad signal circuit. Depending upon the voltage range returned the telematics communication interface control module is able to identify which button has been pressed.

The OnStarÃ,Â® status LED is located with the button assembly. The LED is green when the system is ON and operating normally. When the status LED is green and flashing, it is an indication that a call is in progress. When the LED is red, this indicates a system malfunction is present. In the event there is a system malfunction and the OnStarÃ,Â® system is still able to make a call, the LED will flash red during the call.

If the LED does not illuminate, this may indicate that the customers OnStarÃ,Â® subscription is not active or has expired. Push the blue OnStar button to connect to an advisor who can then verify the account status.

Each LED is controlled by the telematics communication interface control module over dedicated LED signal circuits. Ground for the LED is provided by the wiring harness attached to the button assembly.

Secondary OnStarÃ,Â® Controls

Some vehicles may have an additional button that when pushed can engage the OnStarÃ,Â® system. The button may be a symbol of a face with sound waves, or may say MUTE, or be a symbol of a radio speaker with a slash through it.

By engaging the OnStarÃ,Â® system with this feature, the user can interact with the system by use of voice commands. A complete list of these commands is supplied in the information provided to the customer. If the information is not available for reference, at any command prompt the user can say "HELP" and the telematics communication interface control module will return an audible list of available commands.

OnStarÃ,Â® Microphone

The OnStarÃ,Â®, or cellular microphone, can be a part of the rearview mirror assembly, or on some vehicle lines, a separate, stand alone unit. In either case, the telematics communication interface control module supplies approximately 10 volts to the microphone on the cellular microphone signal circuit, and voice data from the user is sent back to the telematics communication interface control module over the same circuit. A cellular microphone low reference circuit or a drain wire provides a ground for the microphone.

Cellular and GPS Antennas

This vehicle will be equipped with one of the following types of antennas:

- A combination cellular and navigation antenna, which brings the functions of both into a single part
- A cellular, GPS, and digital radio receiver antenna, which also incorporates the functionality of the digital radio receiver satellite antenna (XM).
- A cellular, GPS, and digital radio receiver antenna, which also incorporates the AM/FM antenna.

The cellular antenna is the component that allows the OnStarÃ,Â® system to send and receive data over airwaves by means of cellular technology. The antenna is connected at the base to a coax cable that plugs directly into the telematics communication interface control module.

The GPS antenna is used to collect the signals of the orbiting GPS satellites. Within the antenna is housed a low noise amplifier that allows for a more broad and precise reception of this data. The antenna is connected at the base to a coax cable that plugs directly into the telematics communication interface control module. The cable also provides a path for DC current for powering the antenna.

The OnStarÃ,Â® Call Center also has the capability of communicating with the vehicle during an OnStarÃ,Â® call to retrieve the latest GPS location and transmit it to the OnStarÃ,Â® Call Center. A history location of the last recorded position of the vehicle is stored in the module and marked as aged, for as long as the module power is not removed. Actual GPS location may take up to 10 minutes to register in the event of a loss of power.

OnStarÃ‚Â® RemoteLink

OnStarÃ‚Â® RemoteLink is a mobile app to link mobile devices to a vehicle for limited diagnostics and feature controls. After downloading the app and registering the device, vehicle owners with an eligible vehicle can use their mobile devices to access real-time data from their vehicle and perform specific commands remotely.

All communication between the app and the vehicle is powered by OnStar'sÃ‚Â® advanced connected vehicle technology. An active OnStarÃ‚Â® account as well as a valid OnStarÃ‚Â® username and password are required to use the app. The remote commands must be enabled by logging into the user's OnStarÃ‚Â® account prior to using the app.

Vehicle Control Features

- Lock/Unlock doors
- Start vehicle remotely
- Activate your Horn & Lights
- Contact an OnStar Advisor, Roadside Assistance or your Preferred Dealer

Available Vehicle Data:

- Real-time fuel information, including fuel range, fuel remaining, and lifetime MPG
- Lifetime mileage
- Remaining oil life
- Current tire pressure information
- OnStarÃ‚Â® account information

Compass Heading

The telematics communication interface module has a compass feature to calculate vehicle direction which is displayed via the instrument panel cluster or designated display. The compass heading is determined by dead reckoning until the GPS 3d fix is established. The dead reckoning is accomplished by using the yaw rate sensors and wheel ticks to determine heading changes from a GPS known heading. The GPS 3d fix heading is determined by the deferential of two locations.

Back-up Battery (If Equipped)

IMPORTANT:	Do not disconnect the main vehicle battery or remove the OnStarÃ‚Â® fuse with the ignition key in any position other than OFF. Disconnecting power to the OnStarÃ‚Â® module in any way while the ignition is ON or with retained accessory power activated may cause activation of the OnStarÃ‚Â® Back-Up Battery. This action is per design as the back-up battery is designed to provide power to the telematics communication interface control module so an emergency notification call can be made after an event where the main battery is disabled. Once the Back-Up Battery is activated it will stay on until the power is restored back to the telematics communication interface control module. The telematics communication interface control module naturally chooses the main supply voltage as it's default supply, but if the main supply is removed or lost for any reason the OnStarÃ‚Â® module will use the Back-Up Battery as a power supply as long as the default supply can not be detected. The back-up battery is not rechargeable and once discharged below 9.5 volts the back-up battery must be replaced.

Certain OnStarÃ‚Â® equipped vehicles may also be equipped with a back-up battery. The back-up battery is a non-rechargeable, lithium battery intended to provide an auxiliary power source for the telematics communication interface control module in the event where power from the main vehicle battery is lost.

The back-up battery is intended to have a limited life span of approximately 4 years and is designed to maintain an open circuit voltage between 16 V and 9 V throughout this period. This allows the battery to power the basic functions of the telematics communication interface control module for least one 200 second (5 minute) call at the end of the 4 year span, should the main vehicle battery be lost. In the case of a vehicle losing vehicle battery power, OnStar will switch over to the backup battery based on an internal algorithm. It will look for an air-bag deploy, or near-deploy, messages from the SDM. If there are no messages the OnStar module will stay wake for a few minutes longer and monitor the buttons in the mirror. If not pressed, the modules will power down and shut off completely.

The back-up battery is connected to the telematics communication interface control module through the back-up battery positive voltage circuit and back-up battery ground circuit and is protected from a short circuit by means of an internal fuse. In the event the back-up battery, battery positive voltage circuit is shorted to the back-up battery ground circuit or chassis ground, the fuse will open and render the back-up battery permanently inoperable. The status of the back-up battery and its associated wiring is monitored by the telematics communication interface control module.

Audio System Interface

When the OnStarÃ,Â® requires audio output, a serial data message is sent to the audio system to mute all radio functions and transmit OnStarÃ,Â® originated audio. The OnStarÃ,Â® audio is transmitted to the vehicle audio system by a dedicated signal circuit and a low reference circuit.

The audio system will mute and an audible ring will be heard though the speakers if the vehicle receives a call with the radio ON.

On some vehicles, the HVAC blower speed may be reduced when the OnStarÃ,Â® system is active to aid in reducing interior noise. When the system is no longer active, the blower speed will return to its previous setting.

OnStarÃ,Â® Sleep Cycle

The OnStarÃ,Â® system uses a unique sleep cycle to allow the system to receive cellular calls while the ignition is in the OFF position and retained accessory power mode has ended. This cycle enables the telematics communication interface control module to perform remote functions, such as door unlock, as commanded over the air by the OnStarÃ,Â® Call Center, and to continue to maintain an acceptable level of battery electrical drain.

The OnStarÃ,Â® system uses 4 states of readiness, depending upon the type of cellular market the vehicle is in when the ignition is put into the OFF state:

- High power
- Low power
- Sleep
- Digital standby

The high power state is in effect whenever the ignition is in the ON or RUN position, or retained accessory power is enabled, and the OnStarÃ,Â® system is sending or receiving calls or when the system is performing a remote function.

The low power state is in effect when the OnStarÃ,Â® system is idle with the ignition in the ON or RUN position, or with retained accessory power enabled.

The sleep state is entered after the vehicle has been shut off and the retained accessory power has timed out while in an analog cellular area. At a predetermined time recorded within the telematics communication interface control module, the system re-enters the low power state to listen for a call from the OnStarÃ,Â® Call Center for 1 minute. After this interval, the system will again return to the sleep state for 9 minutes. If a call is sent during the 1 minute interval, the OnStarÃ,Â® system will receive the call and immediately go into the high power mode to perform any requested functions. If no call is received during the 1 minute interval, the system will go back into the sleep mode for another 9 minutes. This process will continue for up to 48 hours, after which the OnStarÃ,Â® system will turn off until the ignition is turned to the ON or RUN position.

The digital standby power state is entered after the vehicle has been shut off and the retained accessory power has timed out while in a digital cellular area. When in digital standby mode, the OnStarÃ,Â® module is able to perform all remote functions as commanded by an OnStarÃ,Â® advisor at any time, for a continuous 120 hours. After 120 hours, the OnStarÃ,Â® module will go into sleep mode until a wake up signal from the vehicle is seen by the telematics communication interface control module. If the OnStar module loses the digital cellular signal it will revert to analog mode and follow the standard sleep state (9 minutes OFF, 1 minute standby) based on the time of the GPS signals, this will continue until a digital cellular signal is again received.

If the OnStarÃ,Â® system loses battery power while the system is in a standby or sleep mode, the system will remain OFF until battery power is restored and the ignition is turned to the ON or RUN position.

Features

OnStarÃ,Â® Personal Calling

The hands free, OnStarÃ,Â® personal calling cellular phone feature is an additional feature of the OnStarÃ,Â® system. This feature is embedded within the telematics communication interface control module; however it must be activated by an OnStarÃ,Â® advisor. OnStarÃ,Â® personal calling operates similar to most hand held cellular phones in that the availability for its usage is based on minutes or units. The customer must have a current OnStarÃ,Â® subscription, as this feature cannot be utilized without it. To use OnStarÃ,Â® personal calling, the customer must also purchase units (minutes) as outlined in the owners guide provided with the OnStarÃ,Â® system. Units begin to deplete, 1 unit is equal to 1 minute, as the customer makes outbound phone calls, answers inbound phone calls, or while connected to the OnStarÃ,Â® virtual advisor. In addition, units may also have an expiration date, depending upon the type of units purchased.

Customers have the ability to store telephone numbers within the module, referenced by a nametag for the convenience of frequently dialed numbers. After storing a nametag, the user can dial this number by initiating the OnStarÃ,Â® personal calling feature, speaking the word "call," and repeating the nametag assigned.

Turn by Turn Navigation

Turn by Turn Navigation allows the driver to contact OnStarÃ,Â® to obtain directions for driving from a current location to a desired location. The Turn by Turn Navigation system stores your planned route and continually checks your position along that route, when you deviate from the planned route, the system will recognize this and prompt the driver with verbal prompts for how to proceed. The driver then responds verbally to direct the system to continue the current routing or to recalculate the route because of a missed turn.

Advisor Record Feature

The Advisor Record Feature allows the user to store any information given during a call with an OnStarÃ,Â® Advisor. Recording is activated by pressing the blue OnStar button during a call; pressing the button a second time stops the recording. The stored information can be played back by pressing the phone button on the three button assembly and using the voice command "Advisor Playback".

Deactivated OnStarÃ,Â® Accounts

In the event a customer has not renewed their OnStarÃ,Â® account after expiration or the account was never activated, OnStarÃ,Â® will make a discrete cellular call to the vehicle to deactivate the OnStarÃ,Â® system. Before taking this action, customers are notified that the OnStarÃ,Â® system in their vehicle will be deactivated unless they elect to renew the account. After the OnStarÃ,Â® account has been deactivated, customers will experience the following:

- The OnStarÃ,Â® status LED will not illuminate.
- The OnStarÃ,Â® system will NOT attempt to connect to the OnStarÃ,Â® Call Center in the event of a collision or if the vehicle's front air bags deploy for any other reason.
- An emergency button press will play a demo message indicating the service has been deactivated.
- An OnStarÃ,Â® Call Center button press will connect the customer with a dedicated sales team who can sell an OnStarÃ,Â® subscription and reactivate the vehicle. Depending on the type of OnStarÃ,Â® hardware in the vehicle, the customer may first hear a demonstration message stating there is no current OnStarÃ,Â® subscription for the vehicle, and directing the customer what to do to activate services.
- OnStarÃ,Â® personal calling will not be available, as this feature requires the customer to have a current OnStarÃ,Â® account. Attempts to use this feature may result in cellular connection failure messages and the inability to connect to the number dialed.

Certain vehicles that have never had an active OnStarÃ,Â® account, or that have been deactivated, may be unable to establish a connection with the OnStarÃ,Â® Call Center. When normal published diagnostic procedures do not indicate a possible cause for the no connect concern, the vehicle may have been deactivated. For deactivated vehicles, a no connect response should be considered normal operation. Further diagnosis and subsequent repair is only necessary should the customer elect to become an active OnStarÃ,Â® subscriber or renew the account subscription.

OnStarÃ,Â® Cellular, GPS, and Diagnostic Limitations

The proper operation of the OnStarÃ,Â® System is dependent on several elements outside the components integrated into the vehicle. These include the National Cellular Network Infrastructure, the cellular telephone carriers within the network, and the GPS.

The cellular operation of the OnStarÃ,Â® system may be inhibited by factors such as the users range from an analog or digital cellular tower, the state of the cellular carrier's equipment, and the location where the call is placed.

Making an OnStarÃ‚Â® key press in areas that lack sufficient cellular coverage or have a temporary equipment failure will result in either the inability of a call to complete with a data transfer or the complete inability to connect to the OnStarÃ‚Â® Call Center. The OnStarÃ‚Â® system may also experience connection issues if the identification numbers for the module, station identification number, electronic serial number or manufacturers electronic ID, are not recognized by the cellular carriers local signal receiving towers.

The satellites that orbit earth providing the OnStar system with GPS data have almost no failures associated with them. In the event of a no GPS concern, the failure will likely lie with the inability of the system to gain GPS signals because of its location, i.e. in a parking structure, hardware failure, or being mistaken with an OnStarÃ‚Â® call which has reached the Call Center without vehicle data.

During diagnostic testing of the OnStarÃ‚Â® system, the technician should ensure the vehicle is located in an area that has a clear unobstructed view of the open sky, and preferably, an area where analog or digital cellular calls have been successfully placed. These areas can be found by successfully making an OnStarÃ‚Â® keypress in a known good OnStarÃ‚Â® equipped vehicle and confirming success with the OnStarÃ‚Â® Call Center advisor. Such places can be used as a permanent reference for future OnStarÃ‚Â® testing.

Mobile Identification Number and Mobile Directory Number

The telematics communication interface control module utilizes 2 numbers for cellular device identification, call routing and connection, a mobile identification number and a mobile directory number. The mobile identification number represents the number used by the cellular carrier for call routing purposes while the mobile directory number represents the number dialed to reach the cellular device.

Operation of the OnStarÃ‚Â® Speech Recognition Systems

OnStarÃ‚Â® users communicate with 2 speech recognition systems. Speech recognition allows the user to speak to one computer in the vehicle, and one reached over a phone line. The computer tries to understand the users command, and responds by speaking back, or by taking the appropriate action, e.g. dialing the phone.

- Personal Calling uses a speech recognition system that resides in the vehicle. When the user presses the phone button, the system states, Ready, and listens for the user's command. The user can speak commands to control the hands-free phone.
- Virtual advisor is a remote speech recognition system that the caller can access by making a phone call. The user connects to virtual advisor by requesting it during personal calling use. The user is then transferred to the virtual advisor server and talks to it via a cellular connection.

The OnStarÃ‚Â® speech recognition systems use speech technology that is designed to understand a wide range of American English speakers. Although there is no one right way to speak English, the system will work best when users try to modify their pronunciation should they encounter difficulty. Users who do not obtain good results are advised to try the tips and workarounds found in this section.

General Tips for Better Speech Recognition

Concern	Tip for Better Result
Noise	Noise may confuse the speech recognition system. You usually get better performance from the system in quieter conditions: • The HVAC fan creates noise. Turn it down or OFF for better speech system performance. • Driving at high speeds creates louder road noise and wind noise. You may get better results at lower speeds. • An open window or an open sunroof allows more noise to enter the vehicle. Close all windows for better results. • Noisy rainstorms can also reduce performance. • If passengers are talking while you use the speech system, it may be confused by their speech. You will get better results if all occupants of the vehicle are quiet while the system is listening for commands.

Concern	Tip for Better Result
When to Speak	In Personal Calling, the system is only listening after it prompts you to speak with a beep. • When the system prompts you to speak, you have about 5 seconds to respond. If the system does not hear a response, it will prompt you again, or cancel the transaction. • If you begin to speak too soon, try pausing for a half second before speaking after the beep. • In the Virtual Advisor, the system is always listening for commands, even while it is speaking.
How to Speak	Speak forcefully, and clearly. • The noisier the environment, the louder you need to speak. If you are in the driver seat, speak facing the front of the car. If you are a passenger, speak facing the rearview mirror. • Speak calmly, and naturally. The system may sometimes fail your repeated attempts to give a command. If your speech is distorted by shouting or frustration, this may cause more errors. • People with high-pitched voices may have better results by speaking in a deeper, lower-pitched voice. However, do not lower the volume of the voice. • Avoid speaking with a rising intonation, like asking a question. Use a flat or falling intonation, like giving an answer.
What to Say	Personal Calling: One-word commands • The Personal Calling system listens for only one word at a time. There are some exceptions, 2-word phrases that are spoken and understood as a single word, e.g. "virtual advisor", "voice feedback", and "my number". You can enter phone numbers only one digit at a time, and the system repeats each digit as it hears it. • Say "Help" at the Ready prompt to hear the list of Personal Calling commands. • Virtual Advisor can understand sentences with more than one word. It also expects to hear a 4-digit number all at once when it asks for your PIN. • Say, "What are my choices?" to hear a list of commands that the Virtual Advisor understands.
Entering a phone number	• If you have trouble getting numbers correctly into the system, store your frequently-called number in the directory, so the system will remember them. After you have stored a number with a nametag, then you simply say "call" and the nametag in order to call the number. • If the system cannot understand your numbers, ask another person to help you enter your frequently-called numbers. This person can speak the numbers, then you can speak the nametag.
Storing or dialing a number	When you have finished speaking your phone number, you do not need to say "store" or "dial" to indicate that you are done. If you pause and say nothing, the system will ask you if you want to store or dial. Say "yes".

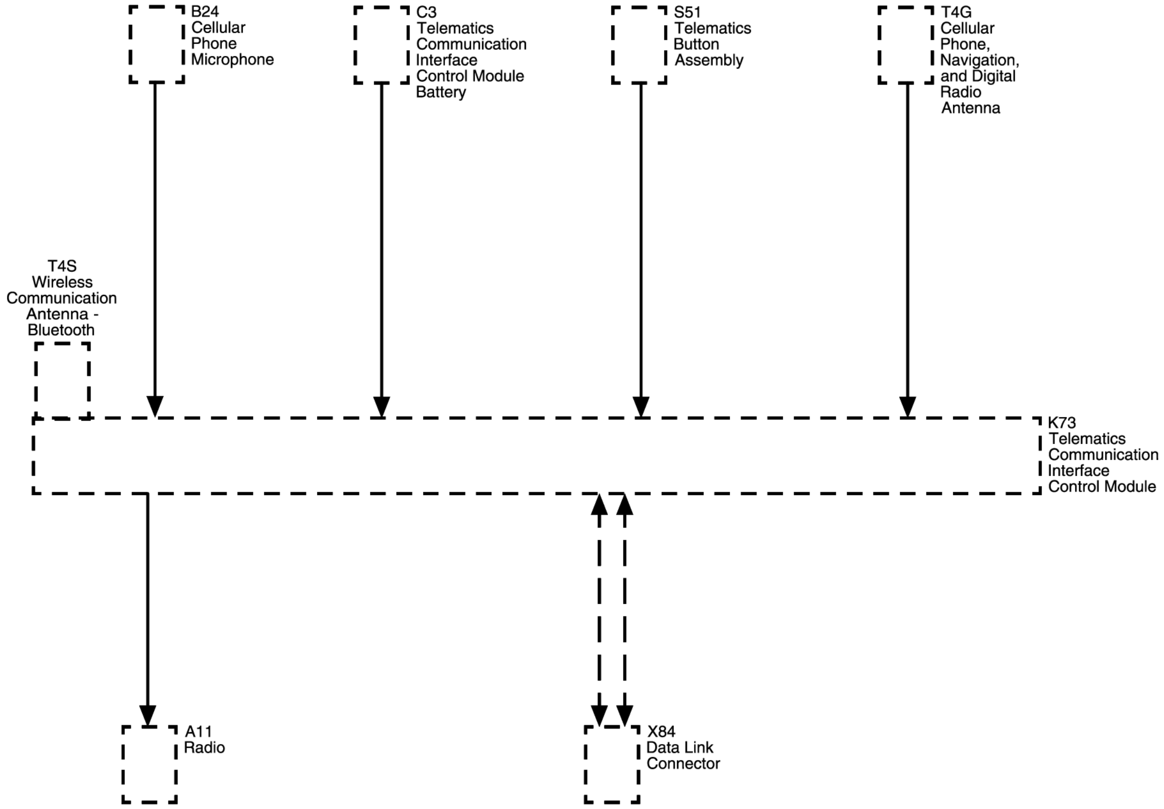
Concern	Tip for Better Result
Creating nametags	• Short nametags that are similar may be easily confused by the system. You may get better recognition of your nametags if you make them longer, for example "George Washington" without pause, instead of "George" only. • If you want to use nametags while driving, it is best to store the nametag with some vehicle noise in the background. If you are in park while you are storing nametags, you can turn the fan on low or open windows in order to create some background noise.
Virtual Advisor 4-digit PIN	Say the 4 digits in a natural way, without pausing between digits.
Interrupting	• When the Virtual Advisor is speaking, you can interrupt it with another command. The first word in your command helps to get its attention. • If the Virtual Advisor has trouble understanding your commands when you interrupt, try speaking the first word loudly and clearly, then pause for an instant, then continue with the rest of the command. For example: "Get... my weather" or "Lookup... a quote for General Motors".

ONSTAR DESCRIPTION AND OPERATION (UE1)

This OnStarÃ,Â® system consists of the following components:

- Telematics communication interface control module
- OnStarÃ,Â® three button assembly
- Microphone
- Cellular antenna
- Navigation antenna
- BluetoothÃ,Â® antenna (If equipped)
- Back up battery (If equipped)
- WiFi Hotspot (If equipped)
- TTY (Teletypewriter)

This system also interfaces with the factory installed vehicle audio system.



B24 Cellular Phone Microphone
C3 Telematics Communication Interface Control Module Battery
S51 Telematics Button Assembly
T4G Cellular Phone, Navigation, and Digital Radio Antenna
T4S Wireless Communication Antenna - Bluetooth
K73 Telematics Communication Interface Control Module
A11 Radio
X84 Data Link Connector

Callout	Component Name
B24	B24 Cellular Phone Microphone
C3	C3 Telematics Communication Interface Control Module Battery
S51	S51 Telematics Button Assembly
T4G	T4G Cellular Phone, Navigation, and Digital Radio Antenna
T4S	T4S Wireless Communication Antenna - Bluetooth
K73	K73 Telematics Communication Interface Control Module
A11	A11 Radio
X84	X84 Data Link Connector

Telematics Communication Interface Control Module

The OnStar Generation 10 system uses Global System for Mobile Communication (GSM) to communicate data and voice signals over the national cellular network. The module may also have the ability to act as a Wireless Local Area Network (WLAN) Wi-Fi hotspot similar to a home wireless router. The module houses an internal WLAN antenna enabling hotspot connectivity and streaming high speed media to the entertainment system. The module also may enable Teletypewriter (TTY) and be capable of Bluetooth communication utilizing an internal antenna. The module is capable of up to 4G LTE speeds and houses 2 technology systems, one to process Global Positioning System (GPS) data, and another for cellular information. The module sends and receives all cellular communications over two cellular antennas and cellular antenna coax cables.

The OnStar Gen 10 system has two antenna inputs, a primary cellular signal and a combined GPS/secondary cellular signal. The OnStarÃ‚Â® system uses the United States Global Positioning System (GPS) signals to provide location on demand. GPS is a space-based satellite navigation system that provides location and time information in all weather conditions, anywhere on or near Earth where there is an unobstructed line of sight to four or more GPS satellites.

The module also has the capability of activating certain features such as, the horn, remote starting, initiating door lock/unlock, or activating the exterior lamps using the serial data circuits. These functions can be commanded by the OnStarÃ‚Â® Call Center per a customer request or mobile device app depending on vehicle and customer subscription.

Dedicated circuits are used to connect the telematics communication interface control module to a microphone, the button assembly, radio, and if equipped the Back Up Battery (BUB). The telematics communication interface control module communicates with the rest of the vehicle over the serial data bus.

Power is provided by a dedicated, fused B+ circuit. Ground is provided through the vehicle wiring harness attached to the module. The power mode state is determined by the telematics communication interface control module through serial data messaging.

OnStarÃ‚Â® Three Button Assembly

- The OnStarÃ‚Â® button assembly may be part of the rearview mirror, or a separate, stand alone unit. The button assembly is comprised of 3 buttons or 3 capacitive touch buttons and status LED's or an error indicator. The buttons are defined as follows:
  - The answer/end button, which is black with a white phone icon or a white driver figure seated with voice signals near its face, allows the user to answer and end calls or initiate speech recognition.
  - The blue OnStarÃ‚Â® call center button, which displays the OnStarÃ‚Â® logo, allows the user to connect to the OnStarÃ‚Â® call center.
  - The emergency button, which displays white letters "SOS" with red background, sends a high priority emergency call to the OnStarÃ‚Â® call center when pressed.

If the LED does not illuminate, this may indicate that the customers OnStarÃ‚Â® subscription is not active or has expired. Push the blue OnStar button to connect to an advisor who can then verify the account status.

The telematics communication interface control module supplies 10 volts to the OnStarÃ‚Â® button assembly on the keypad supply voltage circuit. When pressed, each button completes a circuit across a resistor allowing a specific voltage to be returned to the telematics communication interface control module on the keypad signal circuit.

Depending upon the voltage range returned the telematics communication interface control module is able to identify which button has been pressed.

The OnStarÃ,Â® status LED or error indicator is located near the buttons. The LED is green when the system is ON and operating normally. When any indicator is illuminated and flashing, it is an indication that a call is in progress. When the LED is red, this indicates a system malfunction is present. In the event there is a system malfunction and the OnStarÃ,Â® system is still able to make a call, the LED will flash red during the call.

Each LED or error indicator is controlled by either the telematics communication interface control module over dedicated LED signal circuits or by low speed GM LAN serial data depending on the inside rearview mirror option. Ground for the LED is provided by the wiring harness attached to the button assembly.

Secondary OnStarÃ,Â® Controls

Some vehicles may have an additional button that when pushed can engage the OnStarÃ,Â® system. The button may be a symbol of a face with sound waves, or may say MUTE, or be a symbol of a radio speaker with a slash through it.

By engaging the OnStarÃ,Â® system with this feature, the user can interact with the system by use of voice commands. A complete list of these commands is supplied in the information provided to the customer. If the information is not available for reference, at any command prompt the user can say "HELP" and the telematics communication interface control module will return an audible list of available commands.

OnStarÃ,Â® Microphone

The cellular microphone can be part of the rearview mirror assembly, or a stand-alone unit in the headliner or roof console. In either case, the telematics communication interface control module supplies approximately 10V to the microphone on the cellular microphone signal circuit. The microphone modifies the 10V depending on the volume and voice being detected. A cellular microphone low reference circuit or a drain wire provides a ground for the microphone. The microphone signal circuits pass through the telematics communication interface control module to support entertainment voice recognition.

Cellular and GPS Antennas

The combination antenna will have any of the following antenna elements when equipped with OnStar:

- Primary cellular element
- Secondary cellular element
- GPS element
- Digital radio element
- AM/FM element

The Gen 10 OnStarÃ,Â® system uses 2 cellular antenna elements to send and receive cellular data, the primary cellular element and the secondary cellular element. The primary cellular signal is carried by a coax cable that connects the antenna directly to the telematics communication interface control module. Details of the secondary cellular signal are further described below.

The GPS antenna element is used to collect the signals of the orbiting GPS satellites. Within the antenna is housed a low noise amplifier that allows for a more broad and precise reception of this data. Also housed within the antenna is circuitry to combine the GPS signal and the secondary cellular signal. Without navigation, the combination GPS/secondary cellular signal is carried by a coax cable that connects directly to the telematics communication interface control module. The cable also provides a path for DC current for powering the antenna. With navigation, the combination GPS/secondary cellular signal is carried by a coax cable that connects to the navigation signal splitter. The splitter supplies the GPS signal to the navigation/entertainment system and the GPS/cellular signal to the telematics communication interface control module.

The digital radio element collects digital radio signals from two satellites and where necessary terrestrial repeaters. The digital radio signal is carried by a coax cable and connected to the digital radio receiver. Refer to Radio/Audio System Description and Operation for further details.

The radio signal is sent from a broadcast station and is then received by the AM/FM radio antenna element. The AM/FM radio signal is carried by a coax cable and is connected to the radio. Refer to Radio/Audio System Description and Operation for further details.

OnStarÃ,Â® RemoteLink

OnStarÃ,Â® RemoteLink is a mobile app to link mobile devices to a vehicle for limited diagnostics and feature controls. After downloading the app and registering the device, vehicle owners with an eligible vehicle can use their mobile devices to access real-time data from their vehicle and perform specific commands remotely.

All communication between the app and the vehicle is powered by OnStar'sÃ,Â® advanced connected vehicle technology. An active OnStarÃ,Â® account as well as a valid OnStarÃ,Â® username and password are required to use the app. The remote commands must be enabled by logging into the user's OnStarÃ,Â® account prior to using the app. Refer to the owners manual for available vehicle data and control features.

Compass Heading

The telematics communication interface module has a compass feature to calculate vehicle direction which is displayed via the instrument panel cluster or designated display. The compass heading is determined by dead reckoning until the GPS 3d fix is established. The dead reckoning is accomplished by using the yaw rate sensors and wheel ticks to determine heading changes from a GPS known heading. The GPS 3d fix heading is determined by the deferential of two locations. If "CAL" is displayed on the Instrument Panel Cluster or designated display refer to the owners manual for steps to calibrate the compass.

BluetoothÃ,Â® (If Equipped)

BluetoothÃ,Â® wireless technology is a short-range communications technology intended to replace the cables connecting portable and/or fixed devices while maintaining high levels of security. Only vehicles with steering wheel controls will have BluetoothÃ,Â® functionality. In order to utilize the vehicle's BluetoothÃ,Â® system, a BluetoothÃ,Â® equipped cellular phone is required.

The BluetoothÃ,Â® antenna is internal to the telematics communication interface control module, radio or human machine interface module and is used to send and receive signals from a BluetoothÃ,Â® enabled cellular phone. The available features and functions are determined by the software within the device being used and the telematics communication interface control module. The operating range of the signal from the vehicle is approximately 30 feet. Note that the operating range is dependent upon the cellular phone being used and battery level of the phone.

With BluetoothÃ,Â® technology customers can experience hands-free calling as their BluetoothÃ,Â® capable cellular phones are wirelessly connected to the vehicle. It will allow customers to place and receive calls using the steering wheel controls and voice recognition. The vehicle audio system will allow you to listen to your call through the vehicle speakers and adjust volume through steering wheel or radio controls.

Not all BluetoothÃ,Â® cellular phones are guaranteed to work with the vehicle's BluetoothÃ,Â® system. Based on the cellular phone's service provider and the manufacturer's implementation of BluetoothÃ,Â®, not all phones support all available BluetoothÃ,Â® functionality. BluetoothÃ,Â® enabled cellular phones will be tested for vehicle compatibility and a feature compatibility list will be provided via the GM BluetoothÃ,Â® website: http://www.gm.com/vc/bluetooth/

BluetoothÃ,Â® Features Supported

The following is a list of features supported by the BluetoothÃ,Â® system. Note that not all devices will support all of the listed functions.

- Automatic reconnection - highest priority phone will automatically be connected to vehicle when vehicle ignition is on
- Hands-free dialing- via digits, redial, name tags (phone number saved to a nametag via voice recognition)
- Answering a call
- Ending a call
- Mute a Call
- Rejecting a call - ignore an incoming call
- Call Waiting
- Three-way Calling - initiated from hands-free system
- Send Number During a Call - this is used when calling a menu-driven phone system
- Transfer a Call - transfer call from vehicle to cellular phone and visa versa
- Voice Pass-Thru - allow access to the voice recognition commands on the cellular phone

Pairing a BluetoothÃ‚® Cellular Phone to the Vehicle

In order to use hands-free calling, the cellular phone must be paired to the vehicle. Up to five devices can be paired to the vehicle at one time, but only one can be connected at any given time. To pair a phone, the customer must know how to operate the BluetoothÃ‚® functionality of their phone. The pairing process must only be done one time for each phone, unless that phone's information is deleted. The system will always generate a password and will provide that password if the device you are pairing does not support Secure Simple Pairing (SSP). If the device being paired does support SSP the system will not provide the password and automatically pair the device. For safety reasons, the pairing process is disabled while the vehicle is moving.

Once the BluetoothÃ‚® cellular phone has been paired with vehicle, it will automatically connect to the vehicle when the ignition is on and the device is on. When more than one paired phone is in the vehicle, the phone with the highest priority will be connected. If the cellular phone is in use while getting into the vehicle, the phone can be switched to hands-free mode with the press of a button. In addition, a call in progress can be transferred from the vehicle hands-free mode to the phone to continue the call as the customer exits the vehicle.

Complete pairing instructions are provided in the Vehicle Owners Manual.

Back-up Battery (If Equipped)

NOTE: **Do not disconnect the main vehicle battery or remove the OnStarÃ‚® fuse with the ignition key in any position other than OFF. Disconnecting power to the OnStarÃ‚® module in any way while the ignition is ON or with retained accessory power activated may cause activation of the OnStarÃ‚® Back-Up Battery. This action is per design as the back-up battery is designed to provide power to the telematics communication interface control module so an emergency notification call can be made after an event where the main battery is disabled. Once the Back-Up Battery is activated it will stay on until the power is restored back to the telematics communication interface control module. The telematics communication interface control module naturally chooses the main supply voltage as it's default supply, but if the main supply is removed or lost for any reason the OnStarÃ‚® module will use the Back-Up Battery as a power supply as long as the default supply can not be detected. The back-up battery is not rechargeable and once discharged below 9.5 volts the back-up battery must be replaced.**

Certain OnStarÃ‚® equipped vehicles may also be equipped with a back-up battery. The back-up battery is a non-rechargeable, lithium battery intended to provide an auxiliary power source for the telematics communication interface control module in the event where power from the main vehicle battery is lost.

The back-up battery is intended to have a limited life span of approximately 4 years and is designed to maintain an open circuit voltage between 16 V and 9 V throughout this period. This allows the battery to power the basic functions of the telematics communication interface control module for least one 200 second (5 minute) call at the end of the 4 year span, should the main vehicle battery be lost. In the case of a vehicle losing vehicle battery power, OnStar will switch over to the backup battery based on an internal algorithm. It will look for an air-bag deploy, or near-deploy, messages from the SDM. If there are no messages the OnStar module will stay wake for a few minutes longer and monitor the buttons in the mirror. If not pressed, the modules will power down and shut off completely.

The back-up battery is connected to the telematics communication interface control module through the back-up battery positive voltage circuit and back-up battery ground circuit and is protected from a short circuit by means of an internal fuse. In the event the back-up battery, battery positive voltage circuit is shorted to the back-up battery ground circuit or chassis ground, the fuse will open and render the back-up battery permanently inoperable. The status of the back-up battery and its associated wiring is monitored by the telematics communication interface control module.

WiFi Hotspot

The telematics communication interface control module acts as a Wireless Local Area Network (WLAN) WiFi hotspot router and uses direct 4G LTE connectivity to the internet. It has the ability to connect up to 7 devices at one time. A data plan is required and when purchased, a security default password is established. There are several ways to change the SSID or password, by placing a call to the OnStar Call Center, by using the Gen 10 mobile app or through the scan tool.

The system utilizes a secure autoconnect feature between the telematics communication interface control module and the radio/HMI. No user interaction is required, it is always available and ready to connect to a dedicated in car device. The ignition must be in Run, Accessory or RAP for WiFi to operate.

Audio System Interface

When the OnStarÃ,Â® requires audio output, a serial data message is sent to the audio system to mute all radio functions and transmit OnStarÃ,Â® originated audio. The OnStarÃ,Â® audio is transmitted to the vehicle audio system by a dedicated signal circuit and a low reference circuit.

The audio system will mute and an audible ring will be heard though the speakers if the vehicle receives a call with the radio ON.

On some vehicles, the HVAC blower speed may be reduced when the OnStarÃ,Â® system is active to aid in reducing interior noise. When the system is no longer active, the blower speed will return to its previous setting.

OnStarÃ,Â® Sleep Cycle

The OnStarÃ,Â® system uses a unique sleep cycle to allow the system to receive cellular calls while the ignition is in the OFF position and retained accessory power mode has ended. This cycle enables the telematics communication interface control module to perform remote functions, such as door unlock, as commanded over the air by the OnStarÃ,Â® Call Center, and to continue to maintain an acceptable level of battery electrical drain.

The OnStarÃ,Â® system uses 4 states of readiness, depending upon the type of cellular market the vehicle is in when the ignition is put into the OFF state:

- High power
- Low power
- Sleep
- Digital standby

The high power state is in effect whenever the ignition is in the ON or RUN position, or retained accessory power is enabled, and the OnStarÃ,Â® system is sending or receiving calls or when the system is performing a remote function.

The low power state is in effect when the OnStarÃ,Â® system is idle with the ignition in the ON or RUN position, or with retained accessory power enabled.

The sleep state is entered after the vehicle has been shut off and the retained accessory power has timed out while in an analog cellular area. At a predetermined time recorded within the telematics communication interface control module, the system re-enters the low power state to listen for a call from the OnStarÃ,Â® Call Center for 1 minute. After this interval, the system will again return to the sleep state for 9 minutes. If a call is sent during the 1 minute interval, the OnStarÃ,Â® system will receive the call and immediately go into the high power mode to perform any requested functions. If no call is received during the 1 minute interval, the system will go back into the sleep mode for another 9 minutes. This process will continue for up to 48 hours, after which the OnStarÃ,Â® system will turn off until the ignition is turned to the ON or RUN position.

The digital standby power state is entered after the vehicle has been shut off and the retained accessory power has timed out while in a digital cellular area. When in digital standby mode, the OnStarÃ,Â® module is able to perform all remote functions as commanded by an OnStarÃ,Â® advisor at any time, for a continuous 120 hours. After 120 hours, the OnStarÃ,Â® module will go into sleep mode until a wake up signal from the vehicle is seen by the telematics communication interface control module. If the OnStar module loses the digital cellular signal it will revert to analog mode and follow the standard sleep state (9 minutes OFF, 1 minute standby) based on the time of the GPS signals, this will continue until a digital cellular signal is again received.

If the OnStarÃ,Â® system loses battery power while the system is in a standby or sleep mode, the system will remain OFF until battery power is restored and the ignition is turned to the ON or RUN position.

Features

OnStarÃ,Â® Personal Calling

The hands free, OnStarÃ,Â® personal calling cellular phone feature is an additional feature of the OnStarÃ,Â® system. This feature is embedded within the telematics communication interface control module; however it must be activated by an OnStarÃ,Â® advisor. OnStarÃ,Â® personal calling operates similar to most hand held cellular phones in that the availability for its usage is based on minutes or units. The customer must have a current

OnStarÃ,Â® subscription, as this feature cannot be utilized without it. To use OnStarÃ,Â® personal calling, the customer must also purchase units (minutes) as outlined in the owners guide provided with the OnStarÃ,Â® system. Units begin to deplete, 1 unit is equal to 1 minute, as the customer makes outbound phone calls, answers inbound phone calls, or while connected to the OnStarÃ,Â® virtual advisor. In addition, units may also have an expiration date, depending upon the type of units purchased.

Customers have the ability to store telephone numbers within the module, referenced by a nametag for the convenience of frequently dialed numbers. After storing a nametag, the user can dial this number by initiating the OnStarÃ,Â® personal calling feature, speaking the word "call," and repeating the nametag assigned.

Turn by Turn Navigation

Turn by Turn Navigation allows the driver to contact OnStarÃ,Â® to obtain directions for driving from a current location to a desired location. The Turn by Turn Navigation system stores your planned route and continually checks your position along that route, when you deviate from the planned route, the system will recognize this and prompt the driver with verbal prompts for how to proceed. The driver then responds verbally to direct the system to continue the current routing or to recalculate the route because of a missed turn.

Advisor Record Feature

The Advisor Record Feature allows the user to store any information given during a call with an OnStarÃ,Â® Advisor. Recording is activated by pressing the blue OnStar button during a call; pressing the button a second time stops the recording. The stored information can be played back by pressing the phone button on the three button assembly and using the voice command "Advisor Playback".

Teletypewriter (TTY) Users

OnStar has the ability to communicate to deaf, hard-of-hearing, or speech-impaired customers while in the vehicle. The available dealer-installed TTY system can provide in-vehicle access to all of the OnStar services, except Virtual Advisor and OnStar Turn-by-Turn Navigation.

Deactivated OnStarÃ,Â® Accounts

In the event a customer has not renewed their OnStarÃ,Â® account after expiration or the account was never activated, OnStarÃ,Â® will make a discrete cellular call to the vehicle to deactivate the OnStarÃ,Â® system. Before taking this action, customers are notified that the OnStarÃ,Â® system in their vehicle will be deactivated unless they elect to renew the account. After the OnStarÃ,Â® account has been deactivated, customers will experience the following:

- The OnStarÃ,Â® status LED will not illuminate.
- The OnStarÃ,Â® system will NOT attempt to connect to the OnStarÃ,Â® Call Center in the event of a collision or if the vehicle's front air bags deploy for any other reason.
- An emergency button press will play a demo message indicating the service has been deactivated.
- An OnStarÃ,Â® Call Center button press will connect the customer with a dedicated sales team who can sell an OnStarÃ,Â® subscription and reactivate the vehicle. Depending on the type of OnStarÃ,Â® hardware in the vehicle, the customer may first hear a demonstration message stating there is no current OnStarÃ,Â® subscription for the vehicle, and directing the customer what to do to activate services.
- OnStarÃ,Â® personal calling will not be available, as this feature requires the customer to have a current OnStarÃ,Â® account. Attempts to use this feature may result in cellular connection failure messages and the inability to connect to the number dialed.

Certain vehicles that have never had an active OnStarÃ,Â® account, or that have been deactivated, may be unable to establish a connection with the OnStarÃ,Â® Call Center. When normal published diagnostic procedures do not indicate a possible cause for the no connect concern, the vehicle may have been deactivated. For deactivated vehicles, a no connect response should be considered normal operation. Further diagnosis and subsequent repair is only necessary should the customer elect to become an active OnStarÃ,Â® subscriber or renew the account subscription.

OnStarÃ,Â® Cellular, GPS, and Diagnostic Limitations

The proper operation of the OnStarÃ,Â® System is dependent on several elements outside the components integrated into the vehicle. These include the National Cellular Network Infrastructure, the cellular telephone carriers within the network, and the GPS.

The cellular operation of the OnStarÃ‚Â® system may be inhibited by factors such as the users range from an analog or digital cellular tower, the state of the cellular carrier's equipment, and the location where the call is placed. Making an OnStarÃ‚Â® key press in areas that lack sufficient cellular coverage or have a temporary equipment failure will result in either the inability of a call to complete with a data transfer or the complete inability to connect to the OnStarÃ‚Â® Call Center. The OnStarÃ‚Â® system may also experience connection issues if the identification numbers for the module, station identification number, electronic serial number or manufacturers electronic ID, are not recognized by the cellular carriers local signal receiving towers.

The satellites that orbit earth providing the OnStar system with GPS data have almost no failures associated with them. In the event of a no GPS concern, the failure will likely lie with the inability of the system to gain GPS signals because of its location, i.e. in a parking structure, hardware failure, or being mistaken with an OnStarÃ‚Â® call which has reached the Call Center without vehicle data.

During diagnostic testing of the OnStarÃ‚Â® system, the technician should ensure the vehicle is located in an area that has a clear unobstructed view of the open sky, and preferably, an area where analog or digital cellular calls have been successfully placed. These areas can be found by successfully making an OnStarÃ‚Â® keypress in a known good OnStarÃ‚Â® equipped vehicle and confirming success with the OnStarÃ‚Â® Call Center advisor. Such places can be used as a permanent reference for future OnStarÃ‚Â® testing.

Mobile Identification Number and Mobile Directory Number

The telematics communication interface control module utilizes 2 numbers for cellular device identification, call routing and connection, a mobile identification number and a mobile directory number. The mobile identification number represents the number used by the cellular carrier for call routing purposes while the mobile directory number represents the number dialed to reach the cellular device.

Operation of the OnStarÃ‚Â® Speech Recognition Systems

OnStarÃ‚Â® users communicate with 2 speech recognition systems. Speech recognition allows the user to speak to one computer in the vehicle, and one reached over a phone line. The computer tries to understand the users command, and responds by speaking back, or by taking the appropriate action, e.g. dialing the phone.

- Personal Calling uses a speech recognition system that resides in the vehicle. When the user presses the phone button, the system states, Ready, and listens for the user's command. The user can speak commands to control the hands-free phone.
- Virtual advisor is a remote speech recognition system that the caller can access by making a phone call. The user connects to virtual advisor by requesting it during personal calling use. The user is then transferred to the virtual advisor server and talks to it via a cellular connection.

The OnStarÃ‚Â® speech recognition systems use speech technology that is designed to understand a wide range of American English speakers. Although there is no one right way to speak English, the system will work best when users try to modify their pronunciation should they encounter difficulty. Users who do not obtain good results are advised to try the tips and workarounds found in the Infotainment System Manual or the Owners Manual.

RADIO/AUDIO SYSTEM DESCRIPTION AND OPERATION

Each item in the list below represents topics covered in detail below.

- Radio Circuit Operation
- Information Display and Controls
- Antenna System
- Radio Reception
- Speaker Operation
- Audio Amplifier (If equipped)
- Theft Deterrent
- BluetoothÃ‚Â® (if equipped)
- Auxiliary Audio Input Jack (If equipped)
- USB Port (If equipped)
- OnStarÃ‚Â®
- Steering Wheel Controls (If equipped)
- SCV (Speed Compensated Volume)

- FOTA (Firmware Over The Air)

Radio Circuit Operation

Radio Power

The radio is supplied power by a fused B+ circuit. The radio does not use a discrete ignition feed circuit for power moding. The power mode master provides the system power mode to the radio via serial data messages. The power mode master determines the system power mode by processing power mode information from ignition switch inputs. Serial data power modes supported by the radio are OFF, ACCESSORY, RUN, and CRANK REQUEST.

Radio Retained Accessory Power

The radio retained accessory power system is controlled by serial data. The activation/termination is the same as relay operation (see Retained Accessory Power Description and Operation) with one exception; the only door switch that will turn off the radio during retained accessory power is the driver door open switch.

Radio Grounds

The vehicle harness provides a ground for the radio circuits. The radio may also be case grounded.

Radio Data Link Communication

The radio communicates with other modules via serial data.

Radio Audio Outputs

Each of the audio output channel circuits (+) and (-), at the radio have a DC bias voltage that is approximately one half of battery voltage. The audio being played on the system is produced by a varying AC voltage that is centered around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. The frequency (Hz) of the AC voltage signal is directly related to the frequency of the input (audio source playing) to the audio system. Both the DC bias voltage and the AC voltage signals are needed for the audio system to properly produce sound.

Information Display and Controls

The info display module and radio controls can be separate components from the radio or combined with the radio into one assembly.

When the info display module and radio controls are separate the radio controls communicate radio control inputs directly to the radio through discrete circuits for volume up, volume down and power ON button. It also uses a series of resistors through a single signal circuit when the home, seek up, seek down and phone buttons are pressed. After receiving the message the radio will perform the requested function. The info display module receives digital video data from the radio for on-screen display information through the LVDS (Low Voltage Differential Signal) cable. The radio communicates with the info display module over the radio display touch interrupt request signal for touch screen inputs.

Antenna System

Multi-Band Antenna (if equipped)

The multi-band antenna is located on the roof of the vehicle. This type of antenna may be used with the AM/FM radio, cellular and GPS signals. Keep this antenna clear of snow and ice build up for clear reception. If the vehicle has a sunroof, the performance of the system may be affected if the sunroof is open. Loading items onto the roof of the vehicle can interfere with the performance of the system, ensure the multi-band antenna is not obstructed.

Active Antenna (if equipped)

The active antenna system uses an integral antenna applied as an applique to the rear glass. The antenna module receives both AM and FM signals from the rear glass antenna. The antenna is part of the rear window and looks similar to the defogger grid. One antenna receives AM signals while the other antenna receives FM signals. Any damage to the antenna requires replacing the glass.

The radio antenna module is enabled when the radio is turned on. The radio provides battery voltage to the antenna module using the center conductor of the antenna coaxial cable. When a 12 V signal is seen by the module on the center conductor of the antenna coax, both AM and FM signals are amplified.

Radio Reception

AM/FM Radio Signal

The radio signal is sent from a broadcast station and is then received by an antenna. The strength of the signal received depends on the following:

- The power output (wattage) of the broadcasting station
- The location of the vehicle (or receiver) relative to the broadcast tower.
- Height of the broadcast antenna
- Height of the receiving antenna
- Obstacles between the tower and the receiver
- Atmospheric conditions
- What band (AM or FM) the station is broadcasting
- Type of antenna and the ground plane

Radio Data System (RDS)

The RDS feature is available only on FM stations that broadcast RDS information. This system relies upon receiving specific information from these stations and only works when the information is available. While the radio is tuned to an FM-RDS station, the station name or call letters display. RDS data is carried in what is known as a "subcarrier". A subcarrier is a frequency that the FM broadcaster is authorized to use to send data that is not audible in the main audio program.

RDS functions will only work with FM broadcast stations that are broadcasting RDS data. Not all FM Broadcast stations broadcast RDS data or offer all of the RDS services.

The information displayed is dependent upon the information broadcast by the particular station. The information may vary greatly between stations. RDS functions may not work properly when reception is weak, reception is of poor quality, or RDS is not implemented properly by the FM Broadcaster. In some cases, a radio station broadcasting incorrect information may cause the RDS features of the radio to appear to work improperly.

With RDS, the radio can do the following:

- Display text information such as: station identification, type of programming, and general information (artist and song title, station messages, call in phone numbers, etc.).
- Seek to stations broadcasting the selected type of programming
- Receive announcements concerning local and national emergencies
- Receive alert warnings of local or national emergencies. When an alert announcement comes on the current radio station, ALERT! displays. You will hear the announcement, even if the volume is low or if an auxiliary device is playing. If an auxiliary device is playing, play stops during the announcement. Alert announcements cannot be turned off. ALERT! is not affected by tests of the emergency broadcast system. This feature is not supported by all RDS stations.

Digital Radio Receiver (If equipped)

The vehicle may have one of two digital radio options, satellite transmitted (XM-Sirius) or terrestrial Digital Audio Broadcast (DAB) depending on geographical area.

XM-Sirius

The XM satellite receiver is integrated into the radio. XM satellite radio provides digital radio reception. The XM signal is broadcast from two satellites and, where necessary, terrestrial repeaters. The high power satellites allow the antenna to receive the XM signal even when foliage and other partial obstructions block the antennas view of the satellite. Terrestrial repeaters are used in dense urban areas. These repeaters will receive the satellite signal and re-broadcast them at much higher power levels in order to ensure reception in areas with densely packed tall buildings. A service fee is required in order to receive the XM service.

Digital Audio Broadcast (DAB)

The DAB receiver is integrated into the radio. DAB radio provides digital radio reception. The DAB signal is broadcast from terrestrial transmitters. Services available can include: main radio stations, additional stations (news, sports, etc..) and data services (digital images, video and other data). The availability of services is dependent upon broadcasters in the area. The strength of the DAB signal depends on the following:

- The power output (wattage) of the broadcasting station
- Location of the vehicle (or receiver) relative to the broadcast tower
- Height of the broadcast antenna
- Height of the receiving antenna
- Obstacles between the tower and the receiver
- Type of antenna and the ground plane

Speaker Operation

Speakers turn electrical energy into mechanical energy to move air, using a permanent magnet and an electromagnet. The electromagnet is energized when the radio or amplifier (if equipped) delivers current to the voice coil on the speaker. The voice coil will form a north and south pole that will cause the voice coil and the speaker cone to move in relation to the permanent magnet. The current delivered to the speaker is rapidly changing alternating current (A/C). This causes the speaker cone to move in two directions producing sound.

Audio Amplifier (If equipped)

Amplifier Interface

A fused battery voltage circuit provides the main amplifier power. A switched 12 V output from the radio is used to control the power - state of the amplifier. To respond quickly to audio input and control signals, the amplifier is ON in all vehicle power modes except OFF and CRANK Request. The internal amplifier bridges are fully powered and unmuted when the amplifier receives the switched 12 V input.

Amplifier Operation

The purpose of the amplifier is to increase the power of a voltage or current signal. The output signal of an amplifier may consist of the same frequencies as the input signal or it may consist of only a portion of the frequencies as in the case of a subwoofer or midrange speaker. The radio creates a low level stereo audio output signal, which is sent at the user-defined volume level to the audio amplifier. The audio amplifier amplifies the signal and sends it to the appropriate speakers. Each of the audio output channel circuits (+) and (-), from the amplifier have a DC bias voltage that is approximately one half of battery voltage. The audio being played on the system is produced by a varying AC voltage that is centered around the DC bias voltage on the same circuit. The AC voltage is what causes the speaker cone to move and produce sound. The frequency (Hz) of the AC voltage signal is directly related to the frequency of the input (audio source playing) to the audio system. Both the DC bias voltage and the AC voltage signals are needed for the audio system to properly produce sound.

Theft Deterrent

The radio theft deterrent system is intended to disable or limit radio functionality if incorrect vehicle information is received by the radio. The radio disables functionality if the VIN information received by the radio does not match the VIN information that has been learned by the radio. The radio receives this information via serial data. A possible cause of incorrect VIN info could be the radio was originally installed in another vehicle.

The radio has the following theft operating modes as part of the theft deterrent system:

- Normal Mode: The radio has learned a correct VIN sequence and the VIN information received via serial data matches the learned VIN sequence. In this mode the radio has full functionality.
- No VIN Mode: The radio has not received or learned a correct VIN sequence. In this mode the radio has limited functionality.
- Theft Detected Mode: The radio has learned a correct VIN sequence and the VIN information received via serial data does NOT match the learned VIN sequence. In this mode the radio may be disabled or have limited functionality. The radio display will indicate that theft protection is active.

BluetoothÃ‚® (If Equipped)

BluetoothÃ‚® wireless technology is a short-range communications technology intended to replace the cables connecting portable and/or fixed devices while maintaining high levels of security. Only vehicles with steering wheel controls will have BluetoothÃ‚® functionality. In order to utilize the vehicle's BluetoothÃ‚® system, a BluetoothÃ‚® equipped cellular phone is required.

The BluetoothÃ‚Â® antenna is internal to the telematics communication interface control module, radio or human machine interface module and is used to send and receive signals from a BluetoothÃ‚Â® enabled cellular phone. The available features and functions are determined by the software within the device being used and the telematics communication interface control module. The operating range of the signal from the vehicle is approximately 30 feet. Note that the operating range is dependent upon the cellular phone being used and battery level of the phone.

With BluetoothÃ‚Â® technology customers can experience hands-free calling as their BluetoothÃ‚Â® capable cellular phones are wirelessly connected to the vehicle. It will allow customers to place and receive calls using the steering wheel controls and voice recognition. The vehicle audio system will allow you to listen to your call through the vehicle speakers and adjust volume through steering wheel or radio controls.

Not all BluetoothÃ‚Â® cellular phones are guaranteed to work with the vehicle's BluetoothÃ‚Â® system. Based on the cellular phone's service provider and the manufacturer's implementation of BluetoothÃ‚Â®, not all phones support all available BluetoothÃ‚Â® functionality. BluetoothÃ‚Â® enabled cellular phones will be tested for vehicle compatibility and a feature compatibility list will be provided via the GM BluetoothÃ‚Â® website: http://www.gm.com/vc/bluetooth/

BluetoothÃ‚Â® Features Supported

The following is a list of features supported by the BluetoothÃ‚Â® system. Note that not all devices will support all of the listed functions.

- Automatic reconnection - highest priority phone will automatically be connected to vehicle when vehicle ignition is on
- Hands-free dialing- via digits, redial, name tags (phone number saved to a nametag via voice recognition)
- Answering a call
- Ending a call
- Mute a Call
- Rejecting a call - ignore an incoming call
- Call Waiting
- Three-way Calling - initiated from hands-free system
- Send Number During a Call - this is used when calling a menu-driven phone system
- Transfer a Call - transfer call from vehicle to cellular phone and visa versa
- Voice Pass-Thru - allow access to the voice recognition commands on the cellular phone

Auxiliary Audio Input Jack (If equipped)

The infotainment system may have a 3.5 mm (1/8 in.) auxiliary audio input jack located in the center console or on the radio faceplate. The auxiliary audio input jack interfaces directly with the radio. When a portable audio playback device is connected to the auxiliary jack, an internal switch detects the connection and the radio will switch to AUX as the audio source. Audio signals from the device are sent to the radio from the auxiliary jack via the left, right, and common audio signal circuits.

- When a device is first connected to the 3.5 mm (1/8 in.) input jack the infotainment system automatically switches to that device. If an auxiliary device has already been connected, press the Media or AUX button to select the device.
- Playback of an audio device that is connected to the 3.5 mm jack can only be controlled using the controls on the device.
- The volume control on the device may need to be adjusted to ensure sufficient playback volume through the infotainment system.

USB Port (If Equipped)

The infotainment system may have a USB connector located in the center console. The USB connector interfaces directly with the radio. The USB connector supports both USB standards 1.1 and 2.0.

USB Supported Devices:

- USB Flash Sticks (Thumb Drives)
- Portable USB Hard Drives
- Portable Digital Media Players (iPODÃ‚Â®, ZUNEÃ‚Â®, etc)

Depending on the USB device, some devices may not be recognized, or some features/functions may not be able to be controlled with the radio controls. USB HUB devices are not supported.

Refer to the owner's manual for information on USB devices, control, and operation.

OnStarÃ‚Â® (If equipped)

When OnStar is activated, a serial data message is sent to the radio that activates a software program. When the software begins its process, the fade goes to the front, Bass and Treble are set to the mid range, the outputs are mono, and the audio source is OnStar. OnStar takes priority over any other audio source. All of these actions are preset values stored in the radio.

Steering Wheel Controls (If equipped)

Some audio functions are available using the steering wheel controls. The steering wheel controls duplicate the function of the primary controls available on the radio.

For additional information on steering wheel controls, refer to Steering Wheel Controls Description and Operation.

Speed Compensated Volume

With Speed Compensated Volume the audio system will adjust automatically to make up for road and wind noise as you drive, by increasing the volume as vehicle speed increases. To use speed compensated volume, set the volume to the desired level, then select either Low, Medium, or High. To turn SCV off select the Off screen button.

Firmware Over The Air

The Firmware Over The Air feature was designed to reflash software remotely. Remote reflash is an in-vehicle feature that enables the installation of a software package to update the infotainment system without requiring service test equipment to be physically connected to the vehicle. Remote reflash will utilize a long range or short range connection from the host module to a remote IT system.

SPECIAL TOOLS (MIT TOOL INSTRUCTIONS)

Bluetooth Pairing for Vehicles with Radio RPO: UF7

Either reset the pin code on the radio to 0000, or go under Device Info on the radio and see what the pin code is (to enter it later on the MIT).

1. Turn the BT discoverable ON in the radio Bluetooth settings.
2. Press Pair Device on radio (DO NOT PRESS SEARCH BLUETOOTH DEVICES ON THE RADIO).
3. Press the Pair button on the MIT.
4. When the three LED lights begin flashing on the MIT, enter the pin code (either 0000 if you reset it to that or what the radio pin code was).
5. MIT will then automatically connect with the radio and should show "MIT Connected" message.

   Make test call and the audio streaming test.

Holden Radio Bluetooth Pairing Instructions

1. Using the radio controls, place the radio into "Discoverable Mode".
2. Place the MIT into Bluetooth mode by pressing TEST SELECTOR until the Bluetooth LED is illuminated.
3. With the MIT in Bluetooth mode Press and Release the #1 button (the Bluetooth LED will begin to slowly blink).
4. Now Press and release the PAIR/CALL button on the MIT (the Bluetooth LED will begin to blink a little faster).
5. On the radio Enter the PASSKEY when prompted: (press "0000" then Press "OK").

6. The MIT and radio will PAIR and CONNECT (the Bluetooth LED will be Fast Flashing).
7. Use as regular MIT at this point.

For All Other Radios

Testing the Bluetooth Function

1. Verify connection of the MIT to the USB port.
2. Press and release the TEST SELECTOR button until the Bluetooth LED illuminates.
3. Disable all other Bluetooth devices present in the vehicle (ie. cell phones, laptops, etc.).

Standard Bluetooth Pairing/Bonding

1. Use the vehicle controls to place the radio into Bluetooth Pairing mode. The vehicle will prompt you with a security code.
2. Press and release the PAIR/CALL button. The Bluetooth LED will blink slowly while preparing to have a security code entered.
3. Wait for the all three LEDs to blink confirming it is ready to have the security code entered.
4. Enter the code with the MIT keypad and hit ENTER.
5. The Bluetooth LED will blink slowly while pairing/bonding and move to a quick flash once paired/bonded.

   The vehicle should confirm pairing/bonding is complete.

Streaming Audio

1. Confirm pairing/bonding is complete - the Bluetooth LED will be in a quick flash mode.
2. On some radios the MIT automatically begins streaming audio via A2DP. The audio playback will confirm that the Bluetooth connection using streaming and the audio is working correctly.
3. On other radios you will need to select Bluetooth Audio from the Source menu to verify Audio Streaming.
4. Audio playback confirms that the Bluetooth connection using Streaming Audio is working correctly.
5. Placing a test call will temporarily stop the streaming audio function, but upon disconnection of that test call, the streaming audio from the MIT will resume.

To Place a Test Call

1. Confirm pairing/bonding is complete - the Bluetooth LED will be in a quick flash mode. If the vehicle is equipped with streaming audio, and the radio is set to play a Bluetooth audio file, the streaming audio playback will be audible.
2. Press and release PAIR/CALL button to place a test call. Streaming audio will be temporarily turned off.
3. Use the vehicle controls to answer the call.

   NOTE: **If the call is not answered within several rings, the MIT's audio files will not transmit, even though an active call is occurring.**

4. Audio playback confirms that the Bluetooth connectivity is working correctly.

   NOTE: **The MIT will remain paired/bonded when the call is ended by the vehicle. To re-test the call function, place the MIT in Bluetooth mode and press and release the Pair button to reconnect. When testing is completed, delete MIT from the audio system before returning the vehicle to the customer.**

5. Use the vehicle controls to end the call. If applicable, streaming audio will resume.

Testing the AUX/Line-In Function

1. Verify connection of the MIT as stated above.
2. Press and release the TEST SELECTOR button until the MIT AUX LED illuminates.
3. Use the vehicle controls to put the audio system into Audio (Line-In) mode.
4. Audio playback confirms that the audio input is working correctly.

Testing the USB Function

1. Verify connection of the MIT as stated above.
2. Press and release the TEST SELECTOR button until the MIT USB LED illuminates.
3. Use the vehicle controls to put the audio system into USB mode.

NOTE: **Volume levels may vary dependent upon vehicle audio system.**

4. Audio playback confirms that the USB is working correctly.

Troubleshooting Guide

If the MIT unit is still not working properly after following the below troubleshooting, the unit is malfunctioning and should be repaired or replaced.

Unit not Working

- Verify the MIT is powered on correctly as indicated by the green Power LED.
- If Power LED is not illuminated, verify USB power source is working properly.
- If USB power adapter is being used to power the MIT, check and, if necessary, replace the fuse in adapter.

Problem with Aux/Line-In Test

- Verify Aux/Line-In test cable is inserted properly into the vehicle audio input jack. Verify the MIT is in Aux/Line-In mode as indicated by the red AUX LED.
- Verify the vehicle audio system is in Auxiliary or Line-in mode. Verify the vehicle audio system volume is turned up and not in mute mode.

Problem with USB Test

- Verify MIT is in USB mode as indicated by the red USB LED. Verify the vehicle audio system is in USB mode.
- Verify the vehicle audio system volume is turned up and not in mute mode.

Problem with Bluetooth Pairing

- Delete previous devices stored in the device list of the radio and the pair the MIT.
- Remove USB cable, and then reconnect to reset the MIT. Carefully follow the bonding instructions for the correct Passkey procedure.

Problem with Bluetooth Test Call Audio

- Verify the MIT is paired with the vehicle. This is indicated by the quick flashing Bluetooth LED.
- Audio system should have indicated the MIT is bonded.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC P0572 OR P0573: BRAKE SWITCH CIRCUIT 1 LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check - Vehicle
- Review the description of Strategy Based Diagnosis: Strategy Based Diagnosis
- An overview of each diagnostic category can be found here: Diagnostic Procedure Instructions

DTC Descriptor

DTC P0572

Brake Switch Circuit 1 Low Voltage

DTC P0573

Brake Switch Circuit 1 High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Cruise Control Brake Pedal Signal Circuit	C0297, P0572	P0572	P0573	P0703

Circuit/System Description

For an overview of the component/system, refer to: Cruise Control Description and Operation

Conditions for Running the DTC

- Ignition/Vehicle = On
- Vehicle Speed. = Greater than 40 km/h (25 MPH)
- Cruise Control = On

Frequency the DTC runs = Continuously - After the running conditions are met - For greater than 5 s

Conditions for Setting the DTC

DTC P0572

Brake Pedal Position Circuit Signal - Open/Short to Ground

DTC P0573

Brake Pedal Position Circuit Signal - Short to Voltage

Actions Taken When the DTC Sets

- Cruise Control System Status = Disabled
- DTCs listed in the DTC Descriptor Category = Type C DTC

Conditions for Clearing the DTC

DTCs listed in the DTC Descriptor Category = Type C DTC

Control Module References

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Verify the component works as specified: Brake Pedal Position Sensor
   - **If a related DTC is set**

     Refer to: **Diagnostic Trouble Code (DTC) List - Vehicle**

   - **If a related DTC is not set**
3. Verify that no DTC listed in the DTC Descriptor Category is set.
   - **If a related DTC is set**

     Refer to Circuit/System Testing.

- **If a related DTC is not set**

4. All OK.

Circuit/System Testing

1. Use the schematics to identify the items listed below:
    - Brake Pedal Position Sensor Signal at K20 Engine Control Module
2. Ignition/Vehicle & All vehicle systems - Off
3. Disconnect the component: K20 Engine Control Module
4. Ignition - On / Vehicle - In Service Mode
5. Connect a test lamp between the test points: Brake Pedal Position Sensor Signal & Ground
6. Slowly press and release the brake pedal.

    Verify the test lamp turns On and Off.

    - **If the test lamp is always Off**

    1. Ignition/Vehicle & All vehicle systems - Off
    2. Disconnect the component: K9 Body Control Module
    3. {If equipped} Disconnect all components on the circuit: Brake Pedal Position Sensor Signal
    4. Test for infinite resistance between the test points: Signal circuit terminal 12 at K9 Body Control Module X5 & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance
    5. Test for less than 2 ohms between the test points: Signal circuit terminal 12 at K9 Body Control Module X5 & The other end of the circuit
        - If 2 ohms or greater - Repair the open/high resistance in the circuit.
        - If less than 2 ohms - Replace the component: K9 Body Control Module

    - **If the test lamp is always On**

    1. Ignition/Vehicle & All vehicle systems - Off
    2. Disconnect the component: K9 Body Control Module
    3. Ignition - On / Vehicle - In Service Mode
    4. Test for less than 1 V between the test points: Signal circuit terminal 12 at K9 Body Control Module X5 & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V - Replace the component: K9 Body Control Module

    - **If the test lamp turns On and Off**

7. Replace the component: K20 Engine Control Module

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

For control module replacement, programming, and setup refer to: **Control Module References**

DTC P0575: CRUISE CONTROL SWITCH SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0575

Cruise Control Switch Signal Message Counter Incorrect

Circuit/System Description

When a cruise control function switch is activated, the body control module (BCM) detects a predetermined voltage. The BCM sends a serial data message to the engine control module (ECM) indicating the function that has been requested.

Conditions for Running the DTC

- Vehicle ON.
- The vehicle speed is greater than 40 km/h (25 MPH) and the cruise control is engaged.

Conditions for Setting the DTC

- The ECM receives an invalid cruise control switch status serial data message from the BCM.
- This diagnostic runs continuously.

Actions Taken When the DTC Sets

DTC P0575 is a type C DTC.

Conditions for Clearing the DTC

DTC P0575 is a type C DTC.

Circuit/System Verification

1. Vehicle ON.
2. Verify that no DTCs are set, except DTC P0575.
    - **If any other DTC is set, except DTC P0575**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If only DTC P0575 is set**

3. Replace the K9 Body Control Module.
4. Verify DTC P0575 does not set when operating the vehicle within the Conditions for Running the DTC.
    - **If the DTC sets**

      Replace the K20 Engine Control Module.

    - **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for BCM or ECM programming, replacement, and setup

DTC P0703: BRAKE SWITCH SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0703

Brake Switch Signal Message Counter Incorrect

Circuit/System Description

The body control module (BCM) monitors the brake pedal position sensor. When the brake pedal is applied, the BCM detects a predetermined voltage signal. The BCM sends a serial data message to the engine control module (ECM) indicating the status of the stop lamps.

Conditions for Running the DTC

Vehicle ON.

Conditions for Setting the DTC

- The ECM receives an invalid brake pedal status serial data message from the BCM.
- This diagnostic runs continuously.

Actions Taken When the DTC Sets

- The malfunction indicator lamp (MIL) will not illuminate.
- The cruise control system is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

Circuit/System Verification

1. Vehicle ON.
2. Verify that no DTCs are set, except DTC P0703.
   - **If any other DTC is set, except DTC P0703**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If only DTC P0703 is set**
3. Replace the K9 Body Control Module.
4. Verify DTC P0703 does not set when operating the vehicle within the conditions for running the DTC.
   - **If the DTC sets**

     Replace the K20 Engine Control Module.

   - **If the DTC does not set**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P158A: CRUISE CONTROL CALIBRATION INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P158A

Cruise Control Calibration Incorrect

Circuit/System Description

The type of cruise control system the vehicle has is programmed into the body control module and the engine control module. If this information is not the same in both modules DTC P158A will set.

Conditions for Running the DTC

This diagnostic runs continuously.

Conditions for Setting the DTC

The type of cruise control system programmed into the body control module does not match what is programmed into the engine control module.

Actions Taken When the DTC Sets

DTC P158A is a Type C DTC.

Conditions for Clearing the DTC

DTC P158A is a Type C DTC.

Circuit/System Verification

1. Verify that no DTCs are set, except DTC P158A.
    - **If any other DTC is set, except DTC P158A**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If only DTC P158A is set**
2. Reprogram the K9 Body Control Module and the K20 Engine Control Module one after the other. Do not place the Ignition On/Vehicle in Service Mode between each programming event.
3. Verify DTC P158A does not set when operating the vehicle within the conditions for running the DTC.
    - **If the DTC does not set**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

SYMPTOMS - CRUISE CONTROL

NOTE: The following steps must be completed before using the symptom tables.

1. Before using the symptom diagnostic table, perform the **Diagnostic System Check - Vehicle** in order to verify the following conditions:
    - There are no DTCs set.
    - The module can communicate via the serial data.
2. Review the system operation in order to understand the system functions. Refer to **Cruise Control Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the Cruise Control System. Refer to **Checking Aftermarket Accessories** .
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Cruise Control Malfunction - DTC B3794, P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A-P155C, or P162C**
- **Cruise Control Indicator Malfunction**

CRUISE CONTROL INDICATOR MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The instrument cluster illuminates the cruise control engaged indicator based on serial data messages received from the engine control module (ECM). The indicator is commanded ON when the cruise control system is controlling vehicle speed, and turned OFF with the system disengaged.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	1	1	-	-
Signal	1	P0564	B3794 08, P0567, P0568	B3794 61, P0564
1. Cruise Control Malfunction				

Circuit/System Description

The cruise control switch is an input to the body control module (BCM). The BCM monitors the cruise control on/off, set/coast, resume/accelerate and cancel switches via the cruise control switch signal circuit in order to detect when the driver has requested to perform a cruise control function. The BCM detects a specific voltage signal on the cruise control switch signal circuit when a switch is applied. The engine control module (ECM) receives the requested cruise control switch function from the BCM via a serial data message.

Conditions for Running the DTC

- The cruise control switch is ON.
- Ignition On/Vehicle in Service Mode

Conditions for Setting the DTC

B3794 08

The BCM detects an invalid voltage signal on the cruise control switch signal circuit for 1 s.

B3794 61

Stuck switch for either Resume/Accel or Set/Coast button for 60 s.

P0564, P0565, P0567, P0568, P056C

- The BCM detects an invalid voltage signal on the cruise control switch signal circuit for greater than 2 s and sends a serial data message to the ECM. The ECM sets these DTCs when the message is received.
- The ECM runs this diagnostic continuously.

P0580, P0581

- The ECM detects an invalid voltage signal on the cruise control switch signal circuit.
- The above condition is present for greater than 2 s.
- The ECM runs this diagnostic continuously.

P155A

The ECM is unable to determine the state of the cruise control switch.

P162C

The ECM is unable to determine the state of the vehicle speed limiting switch.

Actions Taken When the DTC Sets

B3794

- The malfunction indicator lamp (MIL) will not illuminate.
- The cruise control system is disabled.

P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A, P162C

DTCs P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A and P162C are type C DTCs

Conditions for Clearing the DTC

B3794

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A, P162C

DTCs P0564, P0565, P0567, P0568, P056C, P0580, P0581, P155A and P162C are type C DTCs.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition On/Vehicle in Service Mode.

2. Verify that the stop lamps operate properly and that no B22 Brake Pedal Position Sensor related DTCs are set.
    - **If brake pedal position sensor related DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle**

    - **If no brake pedal position sensor related DTCs are set**
3. Verify the scan tool K9 Body Control Module Cruise Control Switch Status parameter changes between Off and On, Resume and Set when switching between each position on the cruise control switch.
    - **If the parameter does not change**

      Refer to Circuit/System Testing.

    - **If the parameter changes**
4. Verify that no conditions that may inhibit cruise control operation are present. Refer to the K20 Engine Control Module scan tool data list Cruise Control Inhibit Reason parameter. Refer to the **Cruise Control Description and Operation** for a list of inhibit reasons.
    - **If the cruise control system has a reason why it is inhibited**

      Repair the condition that is causing the inhibit reason.

    - **If the cruise control system does not have any reasons why it may be inhibited**
5. Verify that no cruise control related DTCs are set.
    - **If any cruise control related DTCs are set**

      Refer to Circuit/System Testing.

    - **If no cruise control related DTCs are set**
6. All OK.

Circuit/System Testing

NOTE:

- **An open ignition circuit or fuse before the control module will cause communication DTCs or power mode mismatch DTCs to set against or in the control module. This failure mode will be diagnosed in the no communications diagnostic procedure or power mode mismatch.**
- **This test assumes the ignition circuit has a module driver that will open under a high current condition before the fuse opens.**
- **The module driver can open under normal conditions such as battery run down protection or a retained accessory power mode.**
- **The ignition circuit referred to below is the 12 V reference/lighting control switch reference/voltage supply circuit from the K9 Body Control Module to the S70L Steering Wheel Controls Switch-Left.**
- **The signal circuit referred to below is the cruise control set/coast/resume/accelerate switch signal from the S70L Steering Wheel Controls Switch-Left to the K9 Body Control Module.**

1. Ignition /Vehicle Off, disconnect the harness connector at the S70L Steering Wheel Controls Switch-Left, Ignition On/Vehicle in Service Mode.
2. Verify a test lamp illuminates between the ignition circuit and ground.
    - **If the test lamp does not illuminate**
    1. Ignition/Vehicle Off, disconnect the harness connector at the K9 Body Control Module.
    2. Test for greater than 100 Ω between the ignition circuit and ground.
        - If 100 Ω or less, repair the short to ground on the circuit.
        - If greater than 100 Ω

    3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the K9 Body Control Module.
    - **If the test lamp illuminates**
3. Verify the scan tool K9 Body Control Module Cruise Control Switch Status parameter is Open/Short to Ground or Undetermined State.
    - **If not Open/Short to Ground or Undetermined State**
    1. Ignition/Vehicle Off, disconnect the harness connector at the K9 Body Control Module, Ignition/Vehicle On.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If Open/Short to Ground or Undetermined State**
4. Install a 3 A fused jumper wire between the signal circuit and the ignition circuit.
5. Verify the scan tool K9 Body Control Module Cruise Control Switch Status parameter is Short to Battery or Undetermined State.
    - **If not Short to Battery or Undetermined State**
    1. Ignition/Vehicle Off, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Short to Battery or Undetermined State**
6. Test or replace the S70L Steering Wheel Controls Switch-Left.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for control module replacement, programming and setup.

REPAIR INSTRUCTIONS

CRUISE CONTROL SWITCH REPLACEMENT

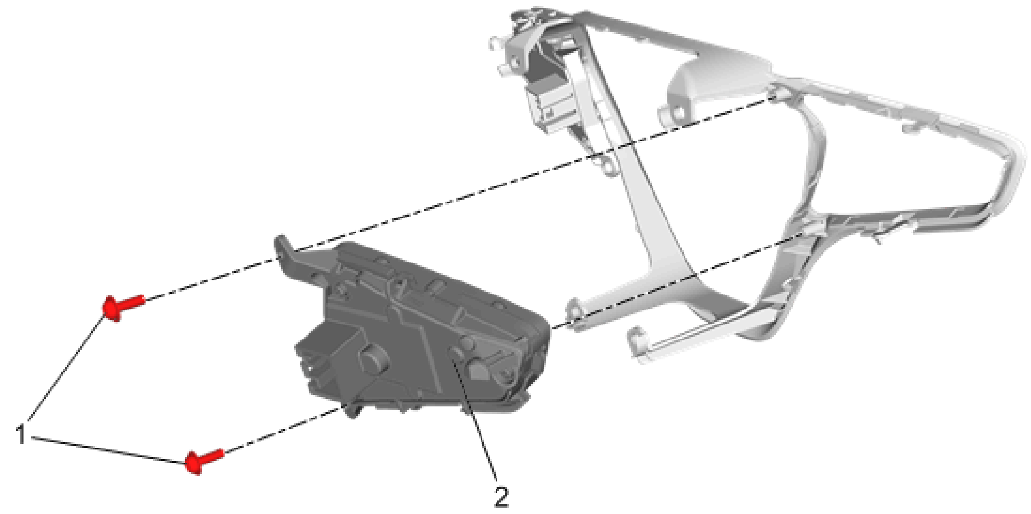

Fig. 3: Cruise Control Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Steering Wheel Spoke Cover Replacement	
1	Steering Wheel Spoke Cover Fastener **CAUTION:** **Refer to Fastener Caution .** **Tighten** 1.5 N.m (13 lb in)
2	Cruise Control Switch **Procedure** Remove the cruise control switch from the steering wheel spoke cover.

P16	P16 Instrument Cluster
K9	K9 Body Control Module

Cruise control is a speed control system that maintains a desired vehicle speed under normal driving conditions at speeds above 40 km/h (25 mph). Steep grades may cause variations in the selected vehicle speeds.

The following are the main components of the Cruise Control System:

- The accelerator pedal
- The brake pedal position (BPP) sensor
- The body control module (BCM)
- The cruise on/off switch
- The cruise control cancel switch
- The + RES switch (equivalent to resume/accelerate switch)
- The - SET switch (equivalent to set/coast switch)
- The engine control module (ECM)
- The throttle actuator control (TAC) motor (gasoline engines only)
- The vehicle speed sensor

The body control module (BCM) monitors the signal circuit of the cruise control switches, which are located on the steering wheel. The BCM relays the cruise control switch status to the engine control module (ECM) via the serial data circuit. The ECM uses the status of the cruise control switch to determine when to capture and maintain the vehicle speed. The ECM monitors the vehicle speed signal circuit in order to determine the desired vehicle speed.

Voltage is supplied to the cruise control switch via the steering wheel control switch reference voltage circuit supplied by the BCM. The cruise control function switches are arranged in a resistive ladder design, with each cruise control function switch having a different resistance value. The BCM detects a specific voltage value that is associated with the cruise control function switch being activated. The BCM sends a serial data message to the ECM indicating that the on/off switch is active. Similarly, when the normally open + RES switch or the normally open - SET switch are pressed, the switch closes and the BCM detects the predetermined voltage signal on the cruise control resume/accel and set/coast switch signal circuit. The BCM sends a serial data message to the ECM indicating that the + RES switch or the - SET switch is active.

Cruise Control Engaged

The Cruise Control System will engage and adjust vehicle speeds, based on the activation of the following cruise control switches, which are located on the steering wheel:

- On/Off
- + RES
- - SET

To engage the Cruise Control System, ensure that the vehicle speed is above 40.2 km/h (25 mph), turn the cruise On/Off switch ON and momentarily press the - SET switch. The ECM will engage the Cruise Control System and record the vehicle speed. The ECM sends a serial data message to the instrument panel cluster (IPC) in order to illuminate the Cruise Engaged indicator in the IPC. Refer to the vehicle owner's manual for the location and operation of the cruise control On/Off indicators and driver information center (DIC) messages.

Pressing the accelerator pedal while the Cruise Control System is engaged, allows the driver to override the Cruise Control System in order to accelerate the vehicle beyond the current set vehicle speed. When the accelerator pedal is released, the vehicle will decelerate and resume the current set vehicle speed.

The driver can also override the current set vehicle speed via the - SET switch and the + RES switch. When the Cruise Control System is engaged, pressing and holding the - SET switch will allow the vehicle to decelerate from the current set vehicle speed without deactivating the Cruise Control System. When the - SET switch is released, the ECM will record the vehicle speed and maintain the vehicle speed as the new set vehicle speed. When the Cruise Control System is engaged, momentarily pressing the - SET switch will allow the vehicle to decelerate at a vehicle specific calibratable increment, commonly 1 km/h or 1 mph, each time that the - SET is momentarily pressed, with a minimum vehicle speed of 38 km/h (24 mph). Refer to the vehicle Owner's Manual for more information.

Pressing and holding the + RES switch, when the Cruise Control System is engaged, will allow the vehicle to accelerate to a greater vehicle speed than the current set vehicle speed. When the + RES switch is released, the ECM will record the vehicle speed and maintain the vehicle speed as the new set vehicle speed. When the Cruise Control System is engaged, momentarily pressing the + RES switch will allow the vehicle to accelerate at a vehicle specific calibratable increment, commonly 1 km/h or 1 mph, each time that the + RES switch is momentarily pressed. Momentarily activating the + RES switch will recall the previous vehicle speed, after the cruise control system has been disengaged by pressing the brake pedal, or CANCEL switch. Refer to the vehicle Owner's Manual for more information.

Cruise Control Disengaged

The engine control module (ECM) disengages the cruise control operation based on the signals from the following switches:

- The brake pedal position (BPP) sensor
- The On/Off switch
- The cruise control cancel switch

The Cruise Control System will disengage when the brake pedal is applied. The body control module (BCM) monitors the BPP sensor via the BPP sensor signal circuit as the voltage signal increases while the pedal is further applied. The ECM monitors the BPP signal through a discrete input and a serial data message signal from the BCM indicating the brake status. When either signal indicates the brake pedal is applied, the ECM will disengage the cruise control system.

The Cruise Control System will also disengage when the cruise control on/off switch is switched OFF, or the cruise control cancel switch is activated. The body control module (BCM) determines when the cruise control cancel switch is activated. When the normally open cancel switch is closed, the BCM detects the predetermined voltage signal on the cruise control function switch circuit. The vehicle speed stored in the memory of the engine control module will be erased when the cruise control On/Off switch is turned OFF, or the ignition switch is turned OFF. The BCM sends a serial data message to the ECM in order to disengage the cruise control system. When the Cruise Control System has been disengaged, the ECM sends a serial message to the instrument panel cluster (IPC) in order to turn OFF the Cruise Engaged indicator.

Every time the Cruise Control System is disengaged, the ECM will keep track of the reason for system disengagement. The last 8 disengagement reasons will be recorded within the ECM memory. The scan tool will display the last 8 Cruise Disengage History parameters, in which one out of approximately 50 possible reasons will be displayed in each of these 8 parameters. For the disengagement reason to be displayed within the scan tool parameter the Cruise Control System is active and disengagement is requested.

When engagement of the system is requested but an engagement inhibit is present, the most recent inhibit reason is recorded in the ECM history. The scan tool will display the most recent inhibit reason, in which one out of approximately 50 possible reasons will be displayed.

Cruise Control Inhibited

The engine control module (ECM) inhibits the cruise control operation when any of the following conditions exist:

- The ECM has not detected a brake pedal activation from the body control module (BCM) this ignition cycle.
- A Cruise Control System DTC has been set.
- The vehicle speed is less than 38.6 km/h (24 mph).
- The vehicle speed is too high.
- The vehicle is in PARK, REVERSE, NEUTRAL, or 1st gear.
- The engine RPM is low.
- The engine RPM is high.
- The system voltage is not between 9 volts and 16 volts.
- The Antilock Brake System (ABS)/Traction Control System (TCS) is active for more than a calibratable time (typically 0.3 to 0.7 seconds).

Cruise Control Inhibit Reasons

This is a general list of inhibit reasons. Not every inhibit reason is applicable to all vehicles. Refer to the scan tool inhibit reason list for the last 8 reasons that have been recorded during the current ignition cycle.

Scan Tool Name	Description	Long Description
Acceleration Rate too High	High acceleration	The vehicle acceleration rate is too high.
Acceleration Time	Rate limiting fault	Cruise torque request rate limiting active too long.
Adaptive Cruise Control Configuration Incorrect	Adaptive cruise control option mismatch	The cruise control type (adaptive cruise or conventional cruise) is mismatched between the engine control module (ECM) and the body control module (BCM).
Antilock Braking System Active	Antilock Braking System Active	The antilock braking system was active. Only reported on enhanced cruise control vehicles.

Scan Tool Name	Description	Long Description
Automatic Braking Engine Torque Request Signal Communication Malfunction	Automatic braking engine torque request signal communication malfunction	An engine control module to electronic brake control module (EBCM) serial data fault is active or communication has been lost between the modules.
Automatic Braking Malfunction	Brake system malfunction	The electronic brake control module has detected a failure that does not allow automatic braking to be performed.
Axle Torque Serial Communication Malfunction	Axle Torque Serial Communication Malfunction	The adaptive cruise control is being inhibited by the ECM because a serial data signal timeout error has occurred with the hybrid max/min torque signals.
Battery Voltage Too High	Voltage above high voltage threshold	The ignition voltage is too high at the engine control module (typically 18 volts).
Battery Voltage Too Low	Voltage below low voltage threshold	The ignition voltage is low at the engine control module (typically 9 volts).
Brake Pedal Applied	Brake pedal apply	The brake pedal was applied.
Brake Pedal Not Initialized	Brake before cruise	The brake pedal has not been seen as applied prior to driver request to engage cruise with set switch. A brake pedal apply must be seen before allowing cruise engagement during each key cycle. On a vehicle equipped with a manual transmission, a clutch pedal apply may satisfy the brake pedal apply criteria.
Brake Pedal Position Malfunction	Brake pedal position signal invalid	A brake pedal apply circuit fault has been detected.
Brake Pedal Position Signal Malfunction	DTC P0703 is active or maximum time elapsed without receiving a valid Brake Pedal Position signal.	A serial data fault is active or communication has been lost with the module sending the brake pedal apply state.
Brake Pedal Pressure Detected	Brake pedal driver applied pressure detected	A brake pedal apply has been detected based on brake pedal pressure as measured by the electronic brake control module.
Brake Pedal Released Position Not Learned	Brake apply sensor home position not learned	The brake pedal position sensor released position is not learned.
Brake System Malfunction	Adaptive cruise control automatic braking failed	Adaptive cruise control automatic braking inoperative.
Calculated Torque	Calculated engine torque	The engine torque calculation is incorrect.
Clutch Pedal Applied	Clutch switch active	The clutch pedal was applied.
Coast Below Minimum Speed	Coast below low speed inhibit	The Set/Coast switch was depressed and the vehicle slowed below the minimum cruise control operating speed.
Coast Mode	Coast disengage	Cruise control is in coast mode with the Set/Coast switch depressed and is requesting no throttle.
Control Function Active	DLC override	A scan tool is plugged into the Data Link Connector (DLC) connector.

Scan Tool Name	Description	Long Description
Control Module Memory Malfunction	Memory failure	A control module memory failure has been detected.
Control Module Processor Malfunction	Processor integrity fault (random access memory corruption)	An engine control module software error has occurred.
Crawl Mode Active	Crawl Mode Active	Crawl mode is active and inhibiting cruise control.
Cruise Control Cancel Switch Active	Cancel switch active	The cruise control cancel switch was depressed.
Cruise Control Software Malfunction	Sequence of completion checks	A cruise control software execution error has occurred.
Cruise Control Switch Inactive	On/Off switch in Off state	The cruise control On/Off switch is turned off.
Cruise Control Switch Invalid	Analog cruise switch input out of range	The cruise control switch voltage signal is in an invalid range.
Cruise Control Switch Serial Communication Malfunction	Serial data fault (cruise switch serial communication fault)	The cruise control switch serial data fault is active or communication has been lost with the module sending cruise control switch states.
Deceleration Rate Too High	High deceleration	The vehicle deceleration rate is too high.
Diagnostic Trouble Code (DTC) Set	Malfunction in PCM/ECM (DTC active)	A DTC is active or in history that inhibits cruise control operation.
Distance Sensing Cruise Control Brake Pedal Applied	Distance Sensing Cruise Control Brake Pedal Applied	Adaptive cruise control is being inhibited by the ECM because a brake pedal apply has occurred.
Distance Sensing Cruise Control Cancel Switch Active	Distance Sensing Cruise Control Cancel Switch Active	Adaptive cruise control is being inhibited by the ECM because the driver applied the cancel switch.
Distance Sensing Cruise Control Data	Serial data fault for adaptive cruise control throttle control and brake control signals sent by the distance sensing cruise control module	A distance sensing cruise control module serial data fault is active or communication has been lost between the distance sensing cruise control module and the engine control module.
Distance Sensing Cruise Control Inhibit	Distance sensing cruise control inhibited	The distance sensing cruise control system is inhibited.
Distance Sensing Cruise Control Invalid Engage	Distance Sensing Cruise Control Invalid Engage	Adaptive cruise control is being inhibited by the ECM because an invalid sequence of cruise control applies, brake pedal applies, or an invalid speed range has been detected.
Distance Sensing Cruise Control Off	Distance Sensing Cruise Control Off	Adaptive cruise control is being inhibited by the ECM because the driver has turned off the cruise on/off switch.
Distance Sensing Cruise Control Reduced Engine Power	Distance Sensing Cruise Control Reduced Engine Power	Adaptive cruise control is being inhibited by the ECM due to a fault resulting in "Reduced Engine Power".
Driven Wheel Speed Higher Than Non Driven Wheel Speed	Driven wheel speed greater (wheel slip detection)	The driven wheel speed is greater than the non driven wheel speed (slip detection).
Engine Control Module	PCM/ECM inhibit (RAM corruption)	Engine control module internal communication error.

Scan Tool Name	**Description**	**Long Description**
Engine Control Module (ECM) Reset	ECM running reset	An engine control module running reset has occurred.
Engine Overspeed Protection Active	Injectors disabled (engine overspeed fuel cut-off active)	Engine RPM limiter active with fuel cut off active.
Engine Overtemperature Protection Active	Engine metal overtemp active	The engine is over temperature. The engine is overheated.
Engine Run Time	Engine run time not elapsed	The engine has not been running long enough, typically five seconds.
Engine Speed	Engine speed too low or too high	The engine RPM is too low (near stall) or too high (near engine RPM fuel shutoff).
Excessive Accelerator Position Override	Pedal greater than cruise (override)	The driver has overridden cruise control set speed with accelerator pedal for greater than an allowable time.
1st Gear	First Gear	Transmission is engaged in 1st gear.
Gear Change without Applied Clutch Pedal	Manual transmission out of gear with no clutch pedal apply	Manual transmission shifted to Neutral without clutch pedal being applied.
Hill Descent Control Active	Hill Descent Control System Active	The hill descent control system has gone active.
Hill Descent Control Serial Communication Malfunction	Hill Descent Control Serial Communication Malfunction	An electronic brake control module serial data fault is active or communication has been lost between the EBCM and ECM.
Hybrid/EV System	Hybrid Cruise Disengage	Cruise control is inhibited on hybrid applications when "Regen on Demand" is requested by the driver via the tap-up/tap-down paddles.
Illegal Mode	Illegal cruise mode	The cruise control mode is incorrect based on switch states.
Lane Center Control Serial Data Error	Lane Center Control Serial Communication Malfunction	Adaptive cruise control is being inhibited by the ECM because a serial data error has been detected on a vehicle with Lane Center Control.
Non Driven Wheel Speed Higher Than Drive Wheel Speed	Non-driven wheel speed greater	The non driven wheel speed is greater than the driven wheel speed.
None	None	This disengagement reason may be displayed after a dead battery repair or module replacement.
Park Brake Applied	Park brake switch signal active	The parking brake is applied.
Power Take-Off Active	Power Take Off active	The Power Take Off (PTO) system is active.
Rear Axle in Low Range	Rear axle in low	The rear axle is in low range.
Set/Coast and Resume/Accelerate Switches Active Simultaneously	SET and RESUME switches simultaneously active	The Set/Coast and Resume/Accelerate switches were pressed simultaneously.
Set/Coast Switch Active With Vehicle Speed Higher Than Set Point	Over schedule tap-down	The Set/Coast switch is selected, vehicle speed is above set speed and does not decrease. May be due to traveling down hill.

Scan Tool Name	Description	Long Description
Speed Limiting/Warning System On	Speed limiter/warning On/Off switch turned on	Driver has turned on the Speed Limiter/Warning on/off switch. Cruise is disabled/inhibited and cruise on/off switch will be set to Off.
Throttle Actuator Control System	Electronic throttle control prevents cruise operation	The electronic throttle control system has detected a failure in the throttle control hardware.
Traction Control Active	Traction control active	The traction control system was active.
Traction Control System Malfunction	Traction Control System Malfunction	A fault is present in the traction control system.
Traction Control System Off	Traction Control System Off	The traction control system has been turned off by the driver.
Transfer Case in 4WD Low Range	Transfer case in 4WD Low	The transfer case is in low range.
Transmission Gear Ratio Malfunction	Transmission gear fault	A transmission DTC is active or in history, that inhibits cruise control operation.
Transmission Not in Forward Gear	Transmission in neutral, reverse or park	The transmission gear selector is not in a forward gear.
Vehicle Overspeed Protection Active	MPH limited fuel (vehicle overspeed fuel cut-off active)	The vehicle overspeed protection is active with fuel cut off active.
Vehicle Speed Higher Than Set Point	Over schedule	Vehicle speed has exceeded driver selected set speed by more than an allowable amount. This may occur while driving down a significant grade or driver overriding cruise while performing a passing maneuver.
Vehicle Speed Lower Than Set Point	Under schedule	The vehicle speed is below cruise control set speed by more than an allowable amount.
Vehicle Speed Too High	Vehicle speed exceeds high speed threshold	Vehicle speed has exceeded maximum cruise operating speed.
Vehicle Speed Too Low	Vehicle speed drops below low speed threshold	Vehicle speed dropped below the cruise control minimum operating speed. May be due to hilly terrain and low vehicle speed. Manual transmission gear selection and engine torque may contribute to this disengagement reason.
Vehicle Stability System Active	Vehicle stability control active	The vehicle stability control system was active.
Vehicle Stability System Malfunction	Vehicle Stability System Malfunction	A fault has been detected in the vehicle stability control system.
Vehicle Stability System Off	Vehicle Stability System Off	The vehicle stability control system has been turned off by the driver.

DESCRIPTION AND OPERATION

BODY CONTROL SYSTEM DESCRIPTION AND OPERATION

The body control system consists of the body control module (BCM), communications, and various input and outputs. Some inputs, outputs and messages require other modules to interact with the BCM. The BCM also has discrete input and output terminals to control the vehicle's body functions. The BCM is wired to the high speed GMLAN serial data bus, low speed GMLAN serial data bus and Multiple LIN buses and acts as a gateway between them.

Power Mode Master

This vehicle body control module (BCM) functions as the power mode master (PMM). The ignition switch is a low current switch with multiple discrete ignition switch signals to the PMM for determining the power mode that will be sent over the serial data circuits to the other modules that need this information; the PMM will activate relays and other direct outputs of the PMM as needed. Refer to **Power Mode Description and Operation** for a complete description of power mode functions.

Gateway

The body control module (BCM) in this vehicle functions as a gateway or translator. The purpose of the gateway is to translate serial data messages between the GMLAN high speed bus and the GMLAN low speed bus for communication between the various modules. The gateway will interact with each network according to that network's transmission protocol.

All communication between the BCM and a scan tool is on the high speed GMLAN serial data circuits. A lost communication DTC typically is set in modules other than the module with a communication failure.

Body Control

The various body control module (BCM) input and output circuits are illustrated in the corresponding functional areas on the BCM electrical schematics. Refer to the **Body Control System Schematics** for more detailed information.

DATA LINK COMMUNICATIONS DESCRIPTION AND OPERATION

NOTE: **This is an overview of different serial data buses used by GM devices to communicate with each others. Use Data Communication Schematics to find out which serial data buses are configured for a specific vehicle.**

Circuit Description

There are many components in a vehicle that rely on information from other sources, transmit information to other sources, or both. Serial data communication networks provide a reliable, cost effective, way for various components of the vehicle to "talk" to one another and share information.

GM uses a number of different communication buses to insure the timely and efficient exchange of information between devices. When compared to each other, some of these buses are different in nature as far as speed, signal characteristics, and behavior. An example of this is the High Speed GMLAN and Low Speed GMLAN buses.

On the other hand, when other buses are compared to each other they have similar characteristics and simply operate in parallel. In this case they are used to group together components which have high interaction. Examples are the High Speed GMLAN, Powertrain Expansion, and Chassis Expansion buses. This allows them to communicate with each other on a bus with reduced message congestion insuring faster and the more timely exchange of information than if all vehicle devices were on a single bus.

The majority of information that exists within a given network generally stays local; however some information will have to be shared on other networks. Control modules designated as Gateway's perform the function of transferring information between the various buses. A Gateway module is connected to at least 2 buses and will interact with each network according to its message strategy and transmission models.

GMLAN provides the capability for a receiving device to monitor message transmissions from other devices in order to determine if messages of interest are not being received. The primary purpose is to allow reasonable default values to be substituted for the information no longer being received. Additionally, a device may set a Diagnostic Trouble Code to indicate that the device it is expecting information from is no longer communicating.

High Speed GMLAN Circuit Description

A High Speed GMLAN Bus is used where data needs to be exchanged at a high enough rate to minimize the delay between the occurrence of a change in sensor value and the reception of this information by a control device using the information to adjust vehicle system performance.

The High Speed GMLAN serial data network consists of two twisted wires. One signal circuit is identified as GMLAN-High and the other signal circuit is identified as GMLAN-Low. At each end of the data bus there is a 120 Ω termination resistor between the GMLAN-High and GMLAN-Low circuits.

Data symbols (1's and 0's) are transmitted sequentially at a rate of 500 Kbit/s. The data to be transmitted over the bus is represented by the voltage difference between the GMLAN-High signal voltage and the GMLAN-Low signal voltage.

When the two wire bus is at rest the GMLAN-High and GMLAN-Low signal circuits are not being driven and this represents a logic "1". In this state both signal circuits are at the same voltage of 2.5 V. The differential voltage is approximately 0 V.

When a logic "0" is to be transmitted, the GMLAN-High signal circuit is driven higher to about 3.5 V and the GMLAN-Low circuit is driven lower to about 1.5 V. The differential voltage becomes approximately 2.0 (+/- 0.5) V.

Chassis High Speed GMLAN Circuit Description

The GMLAN Chassis Expansion Bus is basically a copy of the High Speed GMLAN Bus except that its use is reserved for chassis components. This implementation splits message congestion between two parallel buses helping to insure timely message transmission and reception. Sometimes communication is required between the Chassis Expansion Bus and the primary High Speed GMLAN Bus. This is accomplished by using the K17 Electronic Brake Control Module (EBCM) as the Gateway module. Since the High Speed GMLAN Chassis Expansion Bus and primary High Speed GMLAN Bus operate in the same manner, the diagnostics for each are similar.

Powertrain High Speed GMLAN Circuit Description

The GMLAN Powertrain Expansion Bus is basically a copy of the High Speed GMLAN Bus except that its use is reserved for Hybrid powertrain components or Diesel powertrain components in some cases. The bus is optional based upon feature content. Sometimes communication is required between the Powertrain Expansion Bus and the primary High Speed GMLAN Bus. This is accomplished by using the K20 Engine Control Module (ECM) as the Gateway module. Since the High Speed GMLAN Powertrain Expansion Bus and the primary High Speed GMLAN Bus operate in the same manner, the diagnostics for each are similar.

All diagnostic information is available only through the primary high speed GMLAN bus.

High Voltage Energy Management High Speed GMLAN Circuit Description

The GMLAN High Voltage Energy Management Bus is basically a copy of the High Speed GMLAN Bus except that its use is reserved for Hybrid charging components of an electric vehicle. Sometimes communication is required between the Low Speed GMLAN Bus and the High Voltage Energy

Management Bus. This is accomplished by using the K114B Hybrid Powertrain Control Module 2 as the Gateway module. Since the High Speed GMLAN High Voltage Energy Management Bus and primary High Speed GMLAN Bus operate in the same manner, the diagnostics for each are similar.

All diagnostic information is available only through the primary high speed GMLAN bus.

Gateway Isolated High Speed GMLAN Circuit Description

NOTE: **Continuity check cannot be performed between the X84 Data Link Connector (or control modules on the primary High Speed GMLAN Bus) and control modules on the Gateway Isolated High Speed GMLAN Bus.**

The Gateway Isolated High Speed GMLAN Bus is an extension of the primary High Speed GMLAN Bus except it is separated from the primary High Speed GMLAN Bus by the K56 Serial Data Gateway Module for cybersecurity protection. The K56 Serial Data Gateway Module verifies data messages being transmitted from the control modules on the Gateway Isolated High Speed GMLAN Bus back to the primary High Speed GMLAN Bus are good with valid transmitter messages. This bus does not terminate to the X84 Data Link Connector.

The Gateway Isolated High Speed GMLAN Bus consists of two twisted wires. One signal circuit is identified as GMLAN-High and the other signal circuit is identified as GMLAN-Low. At each end of the data bus there is a 120 Ω termination resistor between the GMLAN-High and GMLAN-Low circuits.

Gateway Expansion High Speed GMLAN Circuit Description

NOTE: **Continuity check cannot be performed between the X84 Data Link Connector (or control modules on the primary High Speed GMLAN Bus) and control modules on the Gateway Expansion High Speed GMLAN Bus.**

The Gateway Expansion High Speed GMLAN Bus is not cybersecurity protected and does not terminate at the X84 Data Link Connector. This expansion bus is created to alleviate the throughput on the primary High Speed GMLAN Bus.

The Gateway Expansion High Speed GMLAN Bus consists of two twisted wires. One signal circuit is identified as GMLAN-High and the other signal circuit is identified as GMLAN-Low. At each end of the data bus there is a 120 Ω termination resistor between the GMLAN-High and GMLAN-Low circuits.

Ethernet Circuit Description

At the core of the infotainment system is the Radio Ethernet Audio Video Bridging switch which communicates directly to each contributing Infotainment module terminator. The Ethernet harness consists of twisted pair wires from point to point. Each device on the Ethernet infotainment system sends/receives data at 100 Mbit/s to/from a specified port at the Radio. The Radio/Ethernet will also be used to program USB software update files to the devices connected to the Ethernet ports.

The Radio is the Ethernet master. The Radio communicates with other devices and systems in the vehicle via GMLAN and LIN. Diagnostic Trouble Codes will be read on GMLAN to diagnose Ethernet, LIN and system faults. GMLAN will also be used for programming calibrations.

Low Speed GMLAN Circuit Description

Low Speed GMLAN Bus is used in applications where a high data rate is not required which allows for the use of less complex components. It is typically used for operator controlled functions where the response time requirements are slower than those required for dynamic vehicle control.

The Low Speed GMLAN Serial Data Network consists of a single wire, ground referenced bus with high side voltage drive. During on road vehicle operation data symbols (1's and 0's) are transmitted sequentially at the normal rate of 33.3 Kbit/s. For component programming only, a special high speed data mode of 83.3 Kbit/s may be used.

Unlike the high speed dual wire networks, the single wire low speed network does not use terminating resistors at either end of the network.

The data symbols to be transmitted over the bus are represented by different voltage signals on the bus. When the Low Speed GMLAN Bus is at rest and is not being driven, there is a low signal voltage of approximately 0.2 V. This represents a logic "1". When a logic "0" is to be transmitted, the signal voltage is driven higher to around 4.0 V or higher.

Gateway Isolated Low Speed GMLAN Circuit Description

NOTE: **Continuity check cannot be performed between the X84 Data Link Connector (or control modules on the primary Low Speed GMLAN Bus) and control modules on the Gateway Isolated Low Speed GMLAN Bus.**

The Gateway Isolated Low Speed GMLAN Bus is an extension of the primary Low Speed GMLAN Bus except it is separated from the primary Low Speed GMLAN Bus by the K56 Serial Data Gateway Module for cybersecurity protection. The K56 Serial Data Gateway Module verifies data messages being transmitted from the control modules on the Gateway Isolated Low Speed GMLAN Bus back to the primary Low Speed GMLAN Bus are good with valid transmitter messages. This bus does not terminate to the X84 Data Link Connector.

Local Interconnect Network (LIN) Circuit Description

The Local Interconnect Network (LIN) Bus consists of a single wire with a transmission rate of 10.417 Kbit/s. This bus is used to exchange information between a master control module and other smart devices which provide supporting functionality. This type of configuration does not require the capacity or speed of either a High Speed GMLAN Bus or Low Speed GMLAN Bus and is thus relatively simpler.

The data symbols (1's and 0's) to be transmitted are represented by different voltage levels on the communication bus. When the LIN Bus is at rest and is not being driven, the signal is in a high voltage state of approximately Vbatt. This represents a logic "1". When a logic "0" is to be transmitted, the signal voltage is driven low to about ground (0.0 V).

Communication Enable Circuit Description

Devices on High Speed GMLAN Bus enable or disable communication based on the voltage level of the communication enable circuit. When the circuit voltage is high (around 12 V), communications are enabled. When the circuit is low, communications are disabled.

Data Link Connector (DLC)

The X84 Data Link Connector (DLC) is a standardized 16-cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Terminal 1: Low speed GMLAN communications terminal
- Terminal 2: Class 2 communications terminal
- Terminal 3: Object high speed GMLAN serial bus (+) terminal
- Terminal 4: Scan tool power ground terminal
- Terminal 5: Common signal ground terminal
- Terminal 6: High speed GMLAN serial data bus (+) terminal
- Terminal 7: Keyword communications terminal
- Terminal 11: Object high speed GMLAN serial bus (-) terminal
- Terminal 12: Chassis high speed GMLAN serial bus (+) terminal
- Terminal 13: Chassis high speed GMLAN serial bus (-) terminal
- Terminal 14: High speed GMLAN serial data bus (-) terminal
- Terminal 16: Scan tool power, battery positive voltage terminal

Auxiliary Data Connector

The X84B Auxiliary Data Connector is a standardized 16-cavity connector. The pinouts for this X84B Auxiliary Data Connector are as follows:

- Terminal 3: High Voltage Energy Management high speed GMLAN serial bus (+) terminal

- Terminal 4: Scan tool power ground terminal
- Terminal 5: Common signal ground terminal
- Terminal 8: Ground terminal for Auxiliary Data Connector identification
- Terminal 11: High Voltage Energy Management high speed GMLAN serial bus (-) terminal
- Terminal 12: Powertrain high speed GMLAN serial bus (+) terminal
- Terminal 13: Powertrain high speed GMLAN serial bus (-) terminal
- Terminal 16: Scan tool power, battery positive voltage terminal

Serial Data Reference

The scan tool communicates over the various buses on the vehicle. When a scan tool is installed on a vehicle, the scan tool will try to communicate with every device that could be optioned into the vehicle. If an option is not installed on the vehicle, the scan tool will display No Comm (or Not Connected) for that optional device. In order to avert misdiagnoses of No Communication with a specific device, refer to **Data Link References** for a list of devices and the buses they communicate with. Use schematics and specific vehicle build RPO codes to determine optional devices.

SERIAL DATA GATEWAY MODULE DESCRIPTION AND OPERATION

The K56 Serial Data Gateway Module is used to handle communications between multiple GMLAN busses and functions as a gateway to isolate the secure networks from the unsecured networks. It was created to mitigate bus loading to support cyber security and new active/advanced safety features like Limited Ability Autonomous Driving and Enhanced Collision Avoidance (if equipped). The K56 Serial Data Gateway Module is used as a frame-to-frame gateway for all functional messages.

Depending on the vehicle contents, the K56 Serial Data Gateway Module is gating between primary High Speed GMLAN Bus, Gateway Expansion High Speed GMLAN Bus, Gateway Isolated High Speed GMLAN Bus, and Chassis High Speed GMLAN Bus. The K56 Serial Data Gateway Module is also gating between primary Low Speed GMLAN Bus and Gateway Isolated Low Speed GMLAN Bus.

Communication between the K56 Serial Data Gateway Module and a scan tool is done through the primary High Speed GMLAN Bus.

DTC B1000: ELECTRONIC CONTROL UNIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1000

Electronic Control Unit

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The internal fault detection is handled inside the device. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

The device runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the device.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.

- If this DTC is retrieved as both a current and history DTC, replace the device that set the DTC.

DTC B1001: OPTION CONFIGURATION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B1001

Option Configuration

For symptom byte information, refer to Symptom Byte List .

Circuit/System Description

Some devices must be configured with serial numbers, vehicle options, or other information. If a device was not properly configured after installation that device may set DTC B1001. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9 - 16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

DTC B1016: VEHICLE IDENTIFICATION NUMBER INFORMATION NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B1016

Vehicle Identification Number Information Not Programmed

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The device performs a self test and vehicle identification number (VIN) verification. This DTC indicates that a VIN is not programmed or that the device has an internal fault. The internal fault detection is handled inside the device, no external circuits are involved.

Conditions for Running the DTC

The only requirements are voltage and ground.

Conditions for Setting the DTC

The device has detected that the VIN is not programmed.

Conditions for Clearing the DTC

- The condition for setting the DTC is no longer present.
- The history DTC will clear after 50 fault-free ignition cycles.
- The DTC can be cleared using a scan tool.

DTC B101D: ELECTRONIC CONTROL UNIT HARDWARE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B101D

Electronic Control Unit Hardware

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The internal fault detection is handled inside the device. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

- The device runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.
- The keyless entry control module will set this DTC with symptom byte 39 when the keyless entry control module antenna is activated.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the device.
- Do not replace a device based only on DTC B101D being set in history with the exception of the following devices:
  - K36 Inflatable Restraint Sensing and Diagnostic Module
  - K85 Passenger Presence Module
- If DTC B101D is set as current, replace the appropriate device.

DTC B101E: ELECTRONIC CONTROL UNIT SOFTWARE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B101E

Electronic Control Unit Software

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Some devices must be configured with specific software, serial numbers, vehicle options, or other information. If a device was not properly configured after installation that device may set DTC B101E. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9 - 16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

DTC C056D: ELECTRONIC CONTROL UNIT HARDWARE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC C056D

Electronic Control Unit Hardware

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The internal fault detection is handled inside the device. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

The device runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground. This program runs even if the voltage is out of the valid operating range.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the device.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.
- If this DTC is retrieved as both a current and history DTC, replace the device that set the DTC.

DTC C056E: ELECTRONIC CONTROL UNIT SOFTWARE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC C056E

- Electronic Control Unit Software

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Some devices must be configured with specific software, serial numbers, vehicle options, or other information. If a device was not properly configured after installation that device may set DTC C056E. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9 - 16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

This diagnostic applies to internal microprocessor integrity conditions within the device. This diagnostic also addresses if the device is not programmed. The device monitors its ability to read and write to the memory. It also monitors a timing function. No external circuits are involved.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is greater than 9.5 V.

Conditions for Setting the DTC

The device detects an internal malfunction or incomplete programming.

Action Taken When the DTC Sets

- DTCs P0601 - P0607, P060A - P060C, and P16E9 - P16F0 are Type A DTCs.
- DTC P062F is a Type C DTCs.
- DTC P262B is a Type B DTC.
- The high voltage contactor relays may open.

Conditions for Clearing the DTC

- DTCs P0601 - P0607, P060A - P060C, and P16E9 - P16F0 are Type A DTCs.
- DTC P062F is a Type C DTCs.
- DTC P262B is a Type B DTC.

Diagnostic Aids

- The DTC P0606 may set in Hybrid/EV Powertrain Control Module 2 due to other faults. Do not replace the Hybrid/EV Powertrain Control Module 2 until other DTCs are diagnosed first.
- The DTC P0606 can falsely set in Hybrid/EV Powertrain Control Module 2 when the 12 V battery has been disconnected/re-connected or if the 12 V battery has been overcharged (over 18 V). In this case, do the following. If this DTC becomes history, use scan tool to clear this DTC. No further action is required:
  - Vehicle OFF and all vehicle systems off. It may take up to 2 minutes for all vehicle systems to power down.
  - Vehicle ON, verify that DTC P0606 is in history and contactors close. (If DTC P0606 remains current and contactors do not close, repeat the above step again).
  - Use scan tool to clear the DTC to turn off the malfunction indicator lamp (MIL).
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.

Circuit/System Verification

NOTE: **The DTC P0606 can falsely set in K114B Hybrid/EV Powertrain Control Module 2 when disconnecting the 12 V battery. See Diagnostic Aids section for more information.**

1. Vehicle in Service Mode.
2. Verify DTC P0606 is not set.
   - **If DTC P0606 is set with other DTCs set**

     Diagnose all other DTCs first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If DTC P0606 is set without other DTCs set**

     Replace the device that set the DTC.

   - **If DTC P0606 is not set**

3. Verify DTC P0602 is not set.
    - **If DTC P0602 is set**
    1. Program the device that set the DTC.
    2. Verify the DTC does not set.
        - If the DTC sets, replace the device that set the DTC.
        - If the DTC does not set
    3. All OK.
    - **If DTC P0602 is not set**
4. Verify DTC P0601, P0603, P0604, P0605, P0607, P060A, P060B, P060C, P062F, P16E9, P16EA, P16EB, P16EC, P16ED, P16EE, P16EF, P16F0, or P262B is not set.
    - **If any of the DTCs are set**

      Replace the device that set the DTC.

    - **If none of the DTCs are set**
5. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for device replacement, programming and setup

DTC P06E4 : CONTROL MODULE WAKE-UP CIRCUIT PERFORMANCE (HYBRID/EV POWERTRAIN CONTROL MODULE 2)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P06E4

Control Module Wake-Up Circuit Performance

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Accessory Wake Up Serial Data 2	P06E4, U0100-U02FF*	U0100-U02FF	U0100-U02FF	-
* Vehicle will not start.				

Circuit/System Description

The accessory wake up serial data 2 circuit is energized by the K114B Hybrid/EV Powertrain Control Module 2 to immediately activate other devices connected to this circuit when the K9 Body Control Module signals the K114B Hybrid/EV Powertrain Control Module 2 that serial data is required.

Depending on the option content, devices that may receive the wake up signal are as follows:

- K1 14 V Power Module
- T18 Battery Charger
- K16 Battery Energy Control Module

- K17 Electronic Brake Control Module
- G1 A/C Compressor
- K71 Transmission Control Module / T12 Automatic Transmission Assembly
- K20 Engine Control Module
- K114A Hybrid/EV Powertrain Control Module 1 / T6 Power Inverter Module

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The vehicle power mode master requires serial data communication to occur.
- The K114B Hybrid/EV Powertrain Control Module 2 attempts to wake up the devices connected to its control module output wake up circuit.
- Circuit check runs continuously.

Conditions for Setting the DTC

- The K114B Hybrid/EV Powertrain Control Module 2 detects a fault in the control module output wake up circuit.
- A circuit fault exists for greater than 6 s.

Action Taken When the DTC Sets

- The DTC P06E4 is a type A DTC.
- The devices is never signaled. Therefore, the specific subsystems will not function.
- The vehicle will not start while the circuit is shorted to ground.
- The malfunction indicator lamp (MIL) will illuminate, along with several DIC messages.

Conditions for Clearing the DTC

- The DTC P06E4 is a type A DTC.
- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

Short to ground will also set multiple no communication codes for high speed GMLAN devices.

Special Tools

EL-48900 HEV Safety Kit

For equivalent regional tools, refer to **Special Tools** .

Circuit/System Verification

1. Verify that DTC U0073, U0074, U0077, U0078, U007A, U1814, U2099, B097B, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1451, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
   - **If none of the DTCs are set**
2. Refer to Circuit/System Testing.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

NOTE: **Use the schematic to determine which devices are on the K114B Hybrid/EV Powertrain Control Module 2 terminal 43 X2 accessory wake up serial data 2 circuit. Use the connector end view to identify the B+, ignition, and accessory wake up serial data 2 circuit terminals for each of those devices.**

1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
2. Vehicle in Service Mode.
3. Verify that a test lamp illuminates between the accessory wake up serial data circuit terminal 67 X2 and ground.

- **If the test lamp does not illuminate**
1. Vehicle OFF and all vehicle systems OFF, remove the test lamp, disconnect the X4 harness connector at the K9 Body Control Module.
2. Test for greater than 100 Ω between the K114B Hybrid/EV Powertrain Control Module 2 wake up circuit terminal 67 X2 and ground.
    - If 100 Ω or less, repair the short to ground in the accessory wake up serial data circuit.
    - If greater than 100 Ω
3. Test for less than 2 Ω between the K114B Hybrid/EV Powertrain Control Module 2 wake up circuit terminal 67 X2 and the K9 Body Control Module wake up circuit terminal 22 X4.
    - If 2 Ω or greater, repair the open/high resistance in the accessory wake up serial data circuit.
    - If less than 2 Ω
4. Replace the K9 Body Control Module.

- **If the test lamp illuminates**

4. Vehicle OFF, remove the test lamp, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
5. Test for greater than 100 Ω, but less than infinite resistance, between the accessory wake up serial data 2 circuit terminal 43 X2 and ground.
    - **If 100 Ω or less**

      Refer to Testing the Accessory Wake Up Serial Data 2 Circuits for a Short to Ground.

    - **If infinite resistance**

      Test for an open/high resistance in the accessory wake up serial data 2 circuit.

    - **If greater than 100 Ω and less than infinite resistance**
6. Vehicle in Service Mode.
7. Verify that a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
8. Vehicle in Service Mode.
9. Verify that a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**

10. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Testing the Accessory Wake Up Serial Data 2 Circuits for a Short to Ground

1. Perform the High Voltage Disabling procedure before proceeding with this diagnostic. Refer to **High Voltage Disabling** .
2. Reconnect the 12 V battery.
3. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at an easily accessible device that shares the K114B Hybrid/EV Powertrain Control Module 2 terminal 43 X2 accessory wake up serial data 2 circuit. It may take up to 2 min for all vehicle systems to power down.
4. Test for less than 100 Ω between the K114B Hybrid/EV Powertrain Control Module 2 accessory wake up serial data 2 circuit terminal 43 X2 and ground.
    - **If 100 Ω or greater**

      Replace the device that was just disconnected.

    - **If less than 100 Ω**
5. Repeat step 3 until all devices on the K114B Hybrid/EV Powertrain Control Module 2 accessory wake up serial data 2 circuit terminal 43 X2 have been disconnected.
6. Repair the short to ground on the accessory wake up serial data 2 circuit.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for device replacement, programming and setup.

DTC P0A1F, P1A01, P1A05, OR P1A06: BATTERY ENERGY CONTROL MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P0A1F

Battery Energy Control Module Performance

DTC P1A01

Battery Energy Control Module Long Term Memory Performance

DTC P1A05

Battery Energy Control Module Random Access Memory

DTC P1A06

Battery Energy Control Module Read Only Memory

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The Battery Energy Control Module will diagnose its own systems and determine when a fault condition is present. Diagnostics and system status is communicated from the Battery Energy Control Module to the Hybrid/EV Powertrain Control Module 2 through serial data. The Hybrid/EV Powertrain Control Module 2 is the host controller for diagnostic trouble code (DTC) information.

This diagnostic applies to internal microprocessor integrity conditions within the Battery Energy Control Module. This fault is internal to the Battery Energy Control Module and no external circuits are involved.

Conditions for Running the DTC

- The Battery Energy Control Module is awake and communicating.
- The system voltage is at least 9 V.

Conditions for Setting the DTC

The Battery Energy Control Module has detected an internal malfunction.

Action Taken When the DTC Sets

- DTCs P0A1F, P1A01, P1A05, and P1A06 are type A DTCs.
- Vehicle goes to reduced battery power mode. After vehicle is turned off, vehicle will not return to propulsion active mode.

Conditions for Clearing the DTC

DTCs P0A1F, P1A01, P1A05, and P1A06 are type A DTCs.

Diagnostic Aids

If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.

Circuit/System Verification

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing**

any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle in Service Mode.

   NOTE: **If the power is interrupted at exactly the time the K16 Battery Energy Control Module is writing to its memory, it may set a false P1A01 DTC.**

2. Verify that DTC P1A01 is not set.
   - **If DTC P1A01 is set**
   1. Vehicle OFF and all vehicle systems OFF. It may take up to 2 min for all vehicle systems to power down.
   2. Vehicle in Service Mode.
   3. Verify that the DTC does not set.
      - If the DTC sets, replace the K16 Battery Energy Control Module.
      - If the DTC does not set
   4. All OK.
   - **If DTC P1A01 is not set**
3. Verify that DTC P0A1F, P1A05, or P1A06 is not set.
   - **If any of the DTCs are set**

     Replace the K16 Battery Energy Control Module.

   - **If none of the DTCs are set**
4. All OK

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Control Module References for device replacement, programming and setup

DTC P16B7: ELECTRIC A/C COMPRESSOR CONTROL MODULE WAKE-UP CIRCUIT PERFORMANCE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P16B7

Electric A/C Compressor Control Module Wake-Up Circuit Performance

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Accessory Wake Up Serial Data 2	P16B7, U016B*	U016B*	U016B*	-
* Other DTCs may set with this fault				

Circuit/System Description

The accessory wake up serial data 2 circuit is energized by the K114B Hybrid/EV Powertrain Control Module 2 to immediately activate the G1 A/C Compressor connected to this circuit when the body control module signals the K114B Hybrid/EV Powertrain Control Module 2 that serial data is required.

Conditions for Running the DTC

- The system voltage is greater than 10.25 V.
- The G1 A/C Compressor is awake.
- Vehicle ON.
- The G1 A/C Compressor receives serial data message from K114B Hybrid/EV Powertrain Control Module 2 and "Propulsion System Active" is TRUE for 500 ms continuously.

Conditions for Setting the DTC

The G1 A/C Compressor detects a fault in the wake up circuit.

Action Taken When the DTC Sets

DTC P16B7 is a type B DTC.

Conditions for Clearing the DTC

DTC P16B7 is a type B DTC.

Diagnostic Aids

Short to ground may set multiple no communication codes for high speed GMLAN devices.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC P06E4 is not set.
   - **If DTC P06E4 is set**

     Refer to **DTC P06E4 (Hybrid/EV Powertrain Control Module 2)**.

   - **If DTC P06E4 is not set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's accessory wake up serial data 2 circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the X1 harness connector at the G1 A/C Compressor. It may take up to 2 min for all vehicle systems to power down.
2. Vehicle in Service Mode.
3. Verify that a test lamp illuminates between the accessory wake up serial data 2 circuit terminal 2 X1 and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF and all vehicle systems OFF, remove the test lamp, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 2 Ω between the G1 A/C Compressor wake up circuit terminal 2 X1 and the K114B Hybrid/EV Powertrain Control Module 2 wake up circuit terminal 43 X2.
      - If 2 Ω or greater, repair the open/high resistance in the accessory wake up serial data 2 circuit.
      - If less than 2 Ω
   3. Vehicle in Service Mode.
   4. Verify that a test lamp illuminates between the K114B Hybrid/EV Powertrain Control Module 2 accessory wake up serial data circuit terminal 67 X2 and ground.
      - If the test lamp does not illuminate, test the accessory wake up serial data circuit for a short to ground or an open/high resistance. If the circuit tests normal, replace the K9 Body Control Module.
      - If the test lamp illuminates
   5. Replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp illuminates**
4. Test or replace the G1 A/C Compressor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P16B8

Electric A/C Compressor Control Module Random Access Memory Performance

DTC P16B9

Electric A/C Compressor Control Module Read Only Memory Performance

DTC P16BA

Electric A/C Compressor Control Module Long Term Memory Performance

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The A/C Compressor will diagnose its own systems and determine when a fault condition is present. This diagnostic applies to internal microprocessor integrity conditions within the A/C compressor. This fault is internal to the A/C compressor and no external circuits are involved.

Conditions for Running the DTC

- System voltage is greater than 10.25 V.
- The device is awake and communicating.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

DTCs P16B8, P16B9, and P16BA are type A DTCs.

Conditions for Clearing the DTC

- DTCs P16B8, P16B9, and P16BA are type A DTCs.
- After the vehicle has been OFF for a sufficient amount of time to allow the devices to enter a sleep mode, the devices will re-enable the output on the following ignition cycle and the DTC will become history.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC P16B8, P16B9, or P16BA is not set.
    - **If any of the DTCs are set**

      Replace the G1 A/C Compressor.

    - **If none of the DTCs are set**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The Hybrid/EV Battery Interface Control Modules will diagnose their own systems and determine when a fault condition is present. This diagnostic applies to internal microprocessor integrity conditions within the Hybrid/EV Battery Interface Control Modules. This fault is internal to the Hybrid/EV Battery Interface Control Modules and no external circuits are involved.

Conditions for Running the DTC

- The device is awake.
- The system voltage is at least 9 V.
- DTC U2603 - U2606 or U2617 - U2624 is not set.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

DTCs P1E8E - P1E91, P1E94 - P1E97, P1E9A - P1E9D, P1EA0 - P1EA3, P1F06 - P1F09, P1FAC - P1FC2, P1FCF - P1FD4, P1FF3, P3031 - P3034, P3037, P303C - P303F, and P3042 are type A DTCs.

Conditions for Clearing the DTC

DTCs P1E8E - P1E91, P1E94 - P1E97, P1E9A - P1E9D, P1EA0 - P1EA3, P1F06 - P1F09, P1FAC - P1FC2, P1FCF - P1FD4, P1FF3, P3031 - P3034, P3037, P303C - P303F, and P3042 are type A DTCs.

Diagnostic Aids

- The Hybrid/EV Battery Interface Control Modules 1 - 12 are all internal to the Battery Energy Control Module.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.

Circuit/System Verification

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle in Service Mode.
2. Verify that DTC P1E8E - P1E91, P1E94 - P1E97, P1E9A - P1E9D, P1EA0 - P1EA3, P1F06 - P1F09, P1FAC - P1FC2, P1FCF - P1FD4, P1FF3, P3031 - P3034, P3037, P303C - P303F, or P3042 is not set.
   - **If any of the DTCs are set**

     Replace the K16 Battery Energy Control Module.

   - **If none of the DTCs are set**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for device replacement, programming and setup

DTC P1EB1: HYBRID/EV BATTERY INTERFACE CONTROL MODULE SOFTWARE INCOMPATIBLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1EB1

Hybrid/EV Battery Interface Control Module Software Incompatible

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

This is the software incompatibility issue between the Hybrid/EV Battery Interface Control Modules and the Battery Energy Control Module. No external circuits are involved.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 9 V.
- DTC U2401, U2603, U2604, U2605, or U2606 is not set.

Conditions for Setting the DTC

- Any one of the Hybrid/EV Battery Interface Control Module software revision does not match.
- Battery Energy Control Module software and Hybrid/EV Battery Interface Control Module software are incompatible.

Action Taken When the DTC Sets

- Slave data that are incompatible with the Battery Energy Control Module software is set to Invalid, 0 V and -40Ã‚Â°C (-40Ã‚Â°F).
- DTC P1EB1 is a type A DTC.

Conditions for Clearing the DTC

DTC P1EB1 is a type A DTC.

Diagnostic Aids

If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.

Circuit/System Verification

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**

DTC P3030

Hybrid/EV Battery Interface Control Module 11 Not Programmed

DTC P303B

Hybrid/EV Battery Interface Control Module 12 Not Programmed

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When the Battery Energy Control Module is flash programmed, the Hybrid/EV Battery Interface Control Module operating software and calibrations are provided to the Battery Energy Control Module. The Hybrid/EV Battery Interface Control Module software and calibrations are then loaded to each of the Hybrid/EV Battery Interface Control Modules from the Battery Energy Control Module. This operation is automatic and requires no operator action. At this point, if any of the Hybrid/EV Battery Interface Control Modules are not programmed correctly, the appropriate DTC is set. This fault is internal to the Hybrid/EV Battery Interface Control Modules and no external circuits are involved.

Conditions for Running the DTC

- The Battery Energy Control Module is awake and communicating.
- The system voltage is at least 9 V.

Conditions for Setting the DTC

The Hybrid/EV Battery Interface Control Module is not programmed correctly.

Action Taken When the DTC Sets

DTCs P1EB2, P1EB3, P1EB4, P1EB5, P1FA6, P1FA7, P1FA8, P1FA9, P1FAA, P1FAB, P3030, and P303B are type A DTCs.

Conditions for Clearing the DTC

- The Hybrid/EV Battery Interface Control Module is programmed correctly.
- DTCs P1EB2, P1EB3, P1EB4, P1EB5, P1FA6, P1FA7, P1FA8, P1FA9, P1FAA, P1FAB, P3030, and P303B are type A DTCs.

Diagnostic Aids

The Hybrid/EV Battery Interface Control Modules 1 - 12 are all internal to the Battery Energy Control Module.

DTC P1EB9: HIGH VOLTAGE ENERGY MANAGEMENT COMMUNICATION BUS ENABLE CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1EB9

High Voltage Energy Management Communication Bus Enable Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High Voltage Energy Management Communication Enable	P1EB9, U0100-U02FF*	U0100-U02FF	U0100-U02FF	-
* Vehicle will not start.				

Circuit/System Description

The Hybrid/EV Powertrain Control Module 2 activates the high voltage energy management communication enable circuit when the vehicle is on. This circuit wakes up the devices for high voltage energy bus communication.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

The Hybrid/EV Powertrain Control Module 2 detects a fault in the high voltage energy management communication enable circuit.

Action Taken When the DTC Sets

DTC P1EB9 is a type A DTC.

Conditions for Clearing the DTC

DTC P1EB9 is a type A DTC.

Diagnostic Aids

Short to ground will also set multiple no communication codes for devices on high voltage energy serial data bus.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

NOTE: **Use the schematics to determine which devices are on the K114B Hybrid/EV Powertrain Control Module 2 terminal 65 X2 high voltage energy management communication enable circuit. Use the connector end views to identify the B+, ignition, and high voltage energy management communication enable circuit terminals for each of those devices.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2. It may take up to 2 min for all vehicle systems to power down.
2. Test for greater than 100 Ω, but less than infinite resistance, between the high voltage energy management communication enable circuit terminal 65 X2 and ground.
   - **If 100 Ω or less**

Refer to Testing the High Voltage Energy Management Communication Enable Circuits for a Short to Ground.

- **If infinite resistance**

  Test for an open/high resistance in the high voltage energy management communication enable circuit.

- **If greater than 100 Ω and less than infinite resistance**

3. Vehicle in Service Mode.
4. Verify that a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp illuminates**
5. Verify that a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp illuminates**
6. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Testing the High Voltage Energy Management Communication Enable Circuits for a Short to Ground

1. Perform the High Voltage Disabling procedure. Refer to **High Voltage Disabling** .
2. Reconnect the 12 V battery.
3. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connector at an easily accessible device that shares the K114B Hybrid/EV Powertrain Control Module 2 terminal 65 X2 high voltage energy management communication enable circuit. It may take up to 2 min for all vehicle systems to power down.
4. Test for less than 100 Ω between the K114B Hybrid/EV Powertrain Control Module 2 high voltage energy management communication enable circuit terminal 65 X2 and ground.
   - **If 100 Ω or greater**

     Replace the device that was just disconnected.

   - **If less than 100 Ω**
5. Repeat step 3 until all devices on the K114B Hybrid/EV Powertrain Control Module 2 high voltage energy management communication enable circuit terminal 65 X2 have been

disconnected.

6. Repair the short to ground on the high voltage energy management communication enable circuit.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for device replacement, programming and setup.

DTC P1EC1 OR P1EC2: BATTERY ENERGY CONTROL MODULE HIGH VOLTAGE ENERGY MANAGEMENT COMMUNICATION BUS ENABLE CIRCUIT LOW VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC P1EC1

Battery Energy Control Module High Voltage Energy Management Communication Bus Enable Circuit Low Voltage

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High Voltage Energy Management Communication Enable	P1EC1	P1EC1	-	-

Circuit/System Description

The Hybrid/EV Powertrain Control Module 2 activates the high voltage energy management communication enable circuit when the vehicle is on. The high voltage energy management communication enable circuit wakes up the Battery Energy Control Module for serial data communication.

The Battery Energy Control Module compares the high voltage energy management communication enable hardwire signal with a Hybrid/EV Powertrain Control Module 2 serial data message indicating that the high voltage energy management communication enable signal is active. If the high voltage energy management communication enable hardwire signal is low when the serial data message indicates it should be high, then DTC P1EC1 is set.

Conditions for Running the DTC

- The device is awake and communicating.
- The system voltage is at least 9 V.
- DTCs U2602, U180B, P1A0C, or P1A07 is not set.

Conditions for Setting the DTC

P1EC1

The ignition voltage on the high voltage energy management communication enable circuit is less than 5 V.

Action Taken When the DTC Sets

DTCs P1EC1 and P1EC2 are type A DTCs.

Conditions for Clearing the DTC

P1EC1

The ignition voltage on the high voltage energy management communication enable circuit is at least 5 V for 10 s.

DTCs P1EC1 and P1EC2 are type A DTCs.

Diagnostic Aids

Short to ground will also set multiple no communication codes for devices on high voltage management serial data bus.

  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

NOTE: **Use the schematics and connector end views to identify the devices' high voltage energy management communication enable circuit terminals.**

1. Vehicle OFF, disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack.
2. Vehicle in Service Mode.
3. Verify that a test lamp illuminates between the high voltage energy management communication enable circuit terminal 11 X357 and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the high voltage energy management communication enable circuit terminal 11 X357 at the A4 Hybrid/EV Battery Pack and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the high voltage energy management communication enable circuit end to end between the A4 Hybrid/EV Battery Pack terminal 11 X357 and the K114B Hybrid/EV Powertrain Control Module 2 terminal 65 X2.
      - If greater than 2 Ω, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp illuminates**
4. Vehicle OFF, connect the X357 harness connector at the A4 Hybrid/EV Battery Pack.
5. Perform the High Voltage Disabling procedure before proceeding with this diagnostic. Refer to **High Voltage Disabling** .
6. Reconnect the 12 V battery.
7. Vehicle OFF, connect the EL-52014 low voltage test harness.
8. Disconnect the X8 harness connector at the K16 Battery Energy Control Module.
9. Vehicle in Service Mode.
10. Verify that a test lamp illuminates between the high voltage energy management communication enable circuit terminal 10 X8 at K16 Battery Energy Control Module and ground.

- **If the test lamp does not illuminate**

  Repair the open/high resistance in the circuit.

- **If the test lamp illuminates**

11. Replace the K16 Battery Energy Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DTC U0020: LOW SPEED CAN BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC U0020

Low Speed CAN Bus

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Devices connected to the GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have programmed information about what messages are needed to be exchanged on the serial data circuits. The messages are also supervised and some periodic messages are used by the receiver device as an availability indication of the transmitter device.

Conditions for Running the DTCs

- Supply voltage to the devices is in the normal operating range.
- The vehicle power mode requires serial data communication to occur.
- The DTC U2100 does not have a current status.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTCs Sets

The device uses a default value for the missing parameter.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

Diagnosis of this DTC is accomplished via the symptom or an additional DTC. Refer to **Scan Tool Does Not Communicate with Low Speed GMLAN Device** , or **Diagnostic Trouble Code (DTC) List - Vehicle** .

DTC U0073 OR U2100: CONTROL MODULE COMMUNICATION BUS A OFF, CAN BUS COMMUNICATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC U0073

Control Module Communication Bus A Off

DTC U2100

CAN Bus Communication

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The serial data circuits are used to communicate information between the devices. The serial data circuits also connect directly to the data link connector (DLC).

Conditions for Running the DTCs

- Supply voltage to the devices is in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the serial data circuits more than 3 times in 5 s.

Action Taken When the DTCs Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- In the transmission control module, DTC U0073 will cause the transmission to go into default gears.
- In the engine control module and transmission control module, DTC U0073 will cause the malfunction indicator lamp (MIL) to illuminate.
- If equipped with eAssist, DTC U0073 in the hybrid powertrain control module is a type B DTC and will cause the malfunction indicator lamp to illuminate and result in the engine operating in conventional engine mode and will maintain 14 V module operation.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- The engine control module or transmission control module turns OFF the MIL after 4 consecutive ignition cycles that the diagnostic runs and does not fail.
- If equipped with eAssist, the hybrid powertrain control module turns off the MIL after the diagnostic runs and does not fail during subsequent ignition cycles. Normal operation will resume 5 s after subsequent ignition cycle.
- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Refer to **Data Link References** to determine which serial data communication system is used for a specific device.
2. This DTC may not be retrieved with a current status. Diagnosis is accomplished using the symptom. Refer to **Symptoms - Data Communications** .

DTC U0074: CONTROL MODULE COMMUNICATION POWERTRAIN EXPANSION CAN BUS OFF

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U0074

Control Module Communication Powertrain Expansion CAN Bus Off

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Powertrain High Speed GMLAN Serial Data (+)	U0074	U0074, U0100-U02FF*	U0074	-
Powertrain High Speed GMLAN Serial Data (-)	U0074	U0074, U0100-U02FF*	U0074	-
Ground (auxiliary data connector terminal 5)	-	U0074	-	-
* An open in only one powertrain high speed GMLAN serial data circuit may allow degraded communication between the devices.				

Circuit/System Description

The serial data is transmitted on two twisted wires that allow speeds up to 500 Kb/s. The twisted pair is terminated with two 120 Ω resistors, one is internal to the engine control module (ECM) and the other can be a separate resistor in a connector assembly or in another device. The resistors are used as the load for the powertrain high speed GMLAN bus during normal vehicle operation. The powertrain high speed GMLAN is a differential bus. The powertrain high speed GMLAN serial data bus (+) and powertrain high speed GMLAN serial data (-) are driven to opposite extremes from a rest or idle level of approximately 2.5 V. Driving the lines to their extremes, adds 1 V to the powertrain high speed GMLAN serial data bus (+) circuit and subtracts 1 V from the powertrain high speed GMLAN serial data bus (-) circuit. If serial data is lost, devices will set a no communication code against the non-communicating device. Note that a loss of serial data DTC does not represent a failure of the device that set it.

The powertrain high speed GMLAN serial data circuits connect directly to the auxiliary data connector. The scan tool does not communicate with powertrain high speed GMLAN bus.

Conditions for Running the DTC

- Supply voltage to the devices are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the powertrain high speed GMLAN serial data circuits more than 3 times.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The MIL and battery indicators will illuminate, along with several DIC messages.
- DTC U0074 is a type A DTC.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.
- DTC U0074 is a type A DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a device reporting a U-code. The U-code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- The engine will not start when there is a total malfunction of the powertrain high speed GMLAN serial data bus.
- Use **Data Link References** to determine which devices connect to the powertrain high speed GMLAN serial data bus.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify two or more devices are not communicating on the powertrain high speed GMLAN serial data circuit. Refer to **Data Link References** to determine how many devices should be communicating on the bus.
    - **If only one device is not communicating**

      Refer to Circuit/System Testing - Testing the Device Circuits.

    - **If two or more devices are not communicating**
3. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the scan tool from the X84 data link connector. The following tests will be done at the X84B auxiliary data connector. It may take up to 2 minutes for all vehicle systems to power down.
4. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
5. Vehicle in Service Mode.
6. Test for less than 4.5 V between the serial data circuits listed below and ground.
    - Terminal 12
    - Terminal 13
    - **If 4.5 V or greater**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Voltage.

    - **If less than 4.5 V**
7. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
8. Test for greater than 100 Ω between the serial data circuits listed below and ground.
    - Terminal 12
    - Terminal 13
    - **If 100 Ω or less**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Ground.

    - **If greater than 100 Ω**
9. Test for 50 - 70 Ω between the serial data circuit terminals 12 and 13.
    - **If less than 35 Ω**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.

    - **If between 35 - 50 Ω**

      There may be a third terminating resistor between the serial data circuits. This can happen if the incorrect device is installed. Some devices are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness. Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.

- **If greater than 70 Ω but less than infinite**

  Refer to Circuit/System Testing - Testing the Serial Data Circuits for an Open/High Resistance.

- **If infinite resistance**

  Repair the open/high resistance in the circuit between the X84B auxiliary data connector and the first splice/device in the serial data circuit.

- **If between 50 - 70 Ω**

10. Refer to Circuit/System Testing - Testing the Device Circuits.

Circuit/System Testing

NOTE: **Some devices with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the device for each of the following tests.**

Each device may need to be disconnected to isolate a circuit fault. Use the schematics and connector end views to identify the following:

- **Powertrain high speed GMLAN devices the vehicle is equipped with**
- **Powertrain high speed GMLAN serial data circuit terminating resistors**
- **Device locations on the powertrain high speed GMLAN serial data circuits**
- **Each device's ground, B+, ignition, and powertrain high speed GMLAN serial data circuit terminals**

Testing the Serial Data Circuits for a Short to Voltage

1. Vehicle OFF, disconnect the harness connectors with the powertrain high speed GMLAN serial data circuits at an easily accessible device, Vehicle in Service Mode.
2. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 4.5 V or less**
   1. Vehicle OFF.
   2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
      - If 10 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 10 Ω, replace the device that was disconnected.
   - **If any serial data circuit is greater than 4.5 V**
3. Vehicle OFF, disconnect the harness connectors with the powertrain high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to voltage, Vehicle in Service Mode.
4. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 4.5 V or less**
   1. Vehicle OFF.
   2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
      - If 10 Ω or greater, repair the open/high resistance in the circuit.

    - If less than 10 Ω, replace the device that was disconnected.
  - **If any serial data circuit is greater than 4.5 V**
5. Repeat step 3 until one of the following conditions are isolated:
   - A short to voltage on the serial data circuit between two devices or splice packs, if equipped.
   - A short to voltage on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the powertrain high speed GMLAN serial data circuits at an easily accessible device.
3. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 100 Ω or greater**

     Replace the device that was disconnected.

   - **If any serial data circuit is less than 100 Ω**
4. Disconnect the harness connectors with the powertrain high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to ground.
5. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
   - **If both serial data circuits are 100 Ω or greater**

     Replace the device that was disconnected.

   - **If any serial data circuit is less than 100 Ω**
6. Repeat step 4 until one of the following conditions are isolated:
   - A short to ground on the serial data circuit between two devices or splice packs, if equipped.
   - A short to ground on the serial data circuit between a device and a terminating resistor.
   - A short to ground on the serial data circuit between the X84B auxiliary data connector and the first device or splice pack.

Testing the Serial Data Circuits for a Short between the Circuits

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the powertrain high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
   - **If each pair of serial data circuits is 110 Ω or greater**

     Replace the device that was disconnected.

   - **If any pair of serial data circuits is less than 110 Ω**
4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the powertrain high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted together.
6. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
   - **If each pair of serial data circuits is 110 Ω or greater**

     Replace the device that was disconnected.

- **If any pair of serial data circuits is less than 110 Ω**

7. Repeat step 4 until one of the following conditions are isolated:
    - Serial data circuits shorted together between two devices or splice packs, if equipped.
    - Serial data circuits shorted together between a device and a terminating resistor.
    - Serial data circuits shorted together between the X84B auxiliary data connector and the first device or splice pack.
    - A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the powertrain high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for less than 130 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuit is 130 Ω or less**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is greater than 130 Ω**
4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the powertrain high speed GMLAN serial data circuits at another device, in the direction of the circuit with the open/high resistance.
6. Test for less than 130 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 130 Ω or less**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is greater than 130 Ω**
7. Repeat step 4 until one of the following conditions are isolated:
    - An open/high resistance on the serial data circuit between two devices or splice packs, if equipped.
    - An open/high resistance on the serial data circuit between a device and a terminating resistor.
    - An open/high resistance terminating resistor.

Testing the Device Circuits

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors at an easily accessible device that is not communicating.
3. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
4. Vehicle in Service Mode
5. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF.
2. Test for infinite resistance between the B+ circuit and ground.
   - If less than infinite resistance, repair the short to ground on the circuit.
   - If infinite resistance, replace the disconnected device.

- **If the test lamp illuminates**

6. Vehicle in Service Mode.
7. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
8. Vehicle in Service Mode
9. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, disconnect the harness connectors at the control module that controls the ignition circuit.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the control module that controls the ignition circuit.
   - **If the test lamp illuminates**
10. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
11. Test for less than 130 Ω between each pair of powertrain high speed GMLAN serial data circuits at the device connector that was just disconnected.
    - **If any pair of serial data circuits is greater than 130 Ω**

      Repair the open/high resistance in the serial data circuits between the disconnected device and the circuit splice in the serial data circuits.

    - **If each pair of serial data circuits is 130 Ω or less**
12. Replace the device that was disconnected.

Repair Instructions

DTC U0077: CONTROL MODULE COMMUNICATION CHASSIS EXPANSION CAN BUS OFF

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U0077

Control Module Communication Chassis Expansion CAN Bus Off

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Chassis High Speed GMLAN Serial Data (+)	U0077	U0077, U0100 - U02FF*	U0077	-
Chassis High Speed GMLAN Serial Data (-)	U0077	U0077, U0100 - U02FF*	U0077	-
Ground (DLC, terminal 5)	-	1	-	-
* An open in only one chassis high speed GMLAN serial data circuit may allow degraded communication between the devices. An open between the Data Link Connector (DLC) and the first splice/device will only affect the communication with the scan tool. The devices will still communicate. 1. No communication with any chassis high speed GMLAN device.				

Circuit/System Description

The GMLAN high speed chassis expansion bus functions the same as the GMLAN high speed bus, and the two buses operate in parallel. The expansion chassis bus was added to reduce message congestion on the primary high speed bus. Since the GMLAN high speed chassis bus and primary GMLAN high speed bus operate in the same manner, the diagnostics for each are the same.

The chassis high speed GMLAN serial data circuits also connect directly to the Data Link Connector (DLC).

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the chassis high speed GMLAN serial data circuits more than 3 times.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- The device inhibits the setting of all other communication DTCs.
- DTC U0077 is a type A DTC.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.

- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.
- DTC U0077 is a type A DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify two or more devices are not communicating on the chassis high speed GMLAN serial data circuit. Refer to **Data Link References** to determine how many devices should be communicating on the bus.
    - **If only one device is not communicating**

      Refer to Circuit/System Testing - Testing the Device Circuits.
    - **If two or more devices are not communicating**
3. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the scan tool from the X84 Data Link Connector. The following tests will be done at the X84 Data Link Connector.
4. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
5. Vehicle in Service Mode.
6. Test for less than 4.5 V between the serial data circuits listed below and ground.
    - Terminal 12
    - Terminal 13
    - **If 4.5 V or greater**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Voltage.
    - **If less than 4.5 V**
7. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
8. Test for greater than 100 Ω between the serial data circuits listed below and ground.
    - Terminal 12
    - Terminal 13
    - **If 100 Ω or less**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Ground.
    - **If greater than 100 Ω**
9. Test for 50 - 70 Ω between the serial data circuit terminals 12 and 13.
    - **If less than 35 Ω**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.
    - **If between 35 - 50 Ω**

      There may be a third terminating resistor between the serial data circuits. This can happen if the incorrect device is installed. Some devices are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness. Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.

- **If greater than 70 Ω but less than infinite**

  Refer to Circuit/System Testing - Testing the Serial Data Circuits for an Open/High Resistance.

- **If infinite resistance**

  Repair the open/high resistance in the circuit between the X84 Data Link Connector and the first splice/device in the serial data circuit.

- **If between 50 - 70 Ω**

10. Refer to Circuit/System Testing - Testing the Device Circuits.

Circuit/System Testing

NOTE: **Some devices with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the device for each of the following tests.**

Each device may need to be disconnected to isolate a circuit fault. Use the schematics and connector end views to identify the following:

- **Chassis high speed GMLAN devices the vehicle is equipped with**
- **Chassis high speed GMLAN serial data circuit terminating resistors**
- **Device locations on the chassis high speed GMLAN serial data circuits**
- **Each device's ground, B+, ignition, and chassis high speed GMLAN serial data circuit terminals**

Testing the Serial Data Circuits for a Short to Voltage

1. Vehicle OFF, disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device, Vehicle in Service Mode.
2. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 4.5 V or less**
   1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
   2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
      - If 10 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 10 Ω, replace the device that was disconnected.
   - **If any serial data circuit is greater than 4.5 V**
3. Vehicle OFF, disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to voltage, Vehicle in Service Mode.
4. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 4.5 V or less**
   1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
   2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
      - If 10 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 10 Ω, replace the device that was disconnected.
   - **If any serial data circuit is greater than 4.5 V**

5. Repeat step 3 until one of the following conditions are isolated:
    - A short to voltage on the serial data circuit between two devices or splice packs, if equipped.
    - A short to voltage on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device.
3. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
    - **If each serial data circuit is 100 Ω or greater**

      Replace the device that was disconnected.

    - **If any serial data circuit is less than 100 Ω**
4. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to ground.
5. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
    - **If both serial data circuits are 100 Ω or greater**

      Replace the device that was disconnected.

    - **If any serial data circuit is less than 100 Ω**
6. Repeat step 4 until one of the following conditions are isolated:
    - A short to ground on the serial data circuit between two devices or splice packs, if equipped.
    - A short to ground on the serial data circuit between a device and a terminating resistor.
    - A short to ground on the serial data circuit between the X84 Data Link Connector and the first device or splice pack.

Testing the Serial Data Circuits for a Short between the Circuits

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 110 Ω or greater**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is less than 110 Ω**
4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted together.
6. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 110 Ω or greater**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is less than 110 Ω**
7. Repeat step 4 until one of the following conditions are isolated:

- Serial data circuits shorted together between two devices or splice packs, if equipped.
- Serial data circuits shorted together between a device and a terminating resistor.
- Serial data circuits shorted together between the X84 Data Link Connector and the first device or splice pack.
- A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for less than 130 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuit is 130 Ω or less**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is greater than 130 Ω**
4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the chassis high speed GMLAN serial data circuits at another device, in the direction of the circuit with the open/high resistance.
6. Test for less than 130 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 130 Ω or less**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is greater than 130 Ω**
7. Repeat step 4 until one of the following conditions are isolated:
    - An open/high resistance on the serial data circuit between two devices or splice packs, if equipped.
    - An open/high resistance on the serial data circuit between a device and a terminating resistor.
    - An open/high resistance terminating resistor.

Testing the Device Circuits

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors at an easily accessible device that is not communicating.
3. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
4. Vehicle in Service Mode
5. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**
1. Vehicle OFF, remove the test lamp.
2. Test for infinite resistance between the B+ circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the disconnected device.
- **If the test lamp illuminates**

6. Vehicle in Service Mode.
7. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the disconnected device.
    - **If the test lamp illuminates**
8. Vehicle in Service Mode
9. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the control module that controls the ignition circuit.
    - **If the test lamp illuminates**
10. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
11. Test for less than 130 Ω between each pair of chassis high speed GMLAN serial data circuits at the device connector that was just disconnected.
    - **If any pair of serial data circuits is greater than 130 Ω**

      Repair the open/high resistance in the serial data circuits between the disconnected device and the circuit splice in the serial data circuits.

    - **If each pair of serial data circuits is 130 Ω or less**
12. Replace the device that was disconnected.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Serial Data Circuit Wiring Repairs
- Control Module References for device replacement, programming and setup

DTC U0078: CONTROL MODULE COMMUNICATION LOW SPEED CAN BUS OFF

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U0078

Control Module Communication Low Speed CAN Bus Off

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The low speed GMLAN serial data bus is used to communicate information between the devices. The serial data is transmitted over a single wire to the appropriate devices. The low speed GMLAN serial data circuits also connect directly to the data link connector (DLC).

Conditions for Running the DTC

- Supply voltage to the devices are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the serial data circuits more than 3 times in 5 seconds.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC U0078 is not set.
    - **If DTC U0078 is set**

      Refer to **Scan Tool Does Not Communicate with Low Speed GMLAN Device** .

    - **If DTC U0078 is not set**
3. All OK

DTC U007A: CONTROL MODULE COMMUNICATION HIGH VOLTAGE ENERGY MANAGEMENT CAN BUS OFF

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U007A

Control Module Communication High Voltage Energy Management CAN Bus Off

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High Voltage Energy Management High Speed GMLAN Serial Data (+)	U007A*	U007A*	U007A*	-
High Voltage Energy Management High Speed GMLAN Serial Data (-)	U007A*	U007A*	U007A*	-
Ground (auxiliary data connector terminal 5)	-	U007A*	-	-
* Other DTCs may be set with this fault.				

Circuit/System Description

Devices connected to the high voltage energy management high speed GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices when the vehicle is on. The high voltage energy management high speed GMLAN serial data bus uses a terminating resistor that is in parallel with the high voltage energy management high speed GMLAN (+) and (-) circuits.

The high voltage energy management high speed GMLAN serial data circuits connect directly to the auxiliary data connector. The scan tool does not communicate with high voltage energy management high speed GMLAN bus.

Conditions for Running the DTC

- Supply voltage to the devices are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the high voltage energy management high speed GMLAN serial data circuits more than 3 times.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:

  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- The engine may not start when there is a total malfunction of the high voltage energy management high speed GMLAN serial data bus.
- Use **Data Link References** to determine which devices connect to the high voltage energy management high speed GMLAN serial data bus.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**

- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

NOTE: **Some devices with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the device for each of the following tests.**

Each device may need to be disconnected to isolate a circuit fault. Use the schematics and connector end views to identify the following:

- **High voltage energy management high speed GMLAN devices the vehicle is equipped with**
- **High voltage energy management high speed GMLAN serial data circuit terminating resistors**
- **Device locations on the high voltage energy management high speed GMLAN serial data circuits**
- **Each device's ground, B+, ignition, and high voltage energy management high speed GMLAN serial data circuit terminals**

1. Perform the High Voltage Disabling procedure before proceeding with this diagnostic. Refer to High Voltage Disabling .
2. Reconnect the 12 V battery after performing the high voltage disabling procedure.
3. Vehicle in Service Mode.
4. Verify two or more devices are not communicating on the high voltage energy management high speed GMLAN serial data circuit. Refer to Data Link References to determine how many devices should be communicating on the bus.
   - **If only one device is not communicating**

     Refer to Testing the Device Circuits.

   - **If two or more devices are not communicating**
5. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the scan tool from the X84 Data Link Connector. The following tests will be done at the X84B Auxiliary Data Connector. It may take up to 2 min for all vehicle systems to power down.
6. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.

        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
7. Vehicle in Service Mode.
8. Test for less than 4.5 V between the serial data circuits listed below and ground.
    - Terminal 3
    - Terminal 11
    - **If 4.5 V or greater**

      Refer to Testing the Serial Data Circuits for a Short to Voltage.

    - **If less than 4.5 V**
9. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
10. Test for greater than 100 Ω between the serial data circuits listed below and ground.
    - Terminal 3
    - Terminal 11
    - **If 100 Ω or less**

      Refer to Testing the Serial Data Circuits for a Short to Ground.

    - **If greater than 100 Ω**
11. Test for 50 - 70 Ω between the serial data circuit terminals 3 and 11.
    - **If less than 35 Ω**

      Refer to Testing the Serial Data Circuits for a Short between the Circuits.

    - **If between 35 - 50 Ω**

      There may be a third terminating resistor between the serial data circuits. This can happen if the incorrect device is installed. Some devices are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness. Refer to Testing the Serial Data Circuits for a Short between the Circuits.

    - **If greater than 70 Ω but less than infinite**

      Refer to Testing the Serial Data Circuits for an Open/High Resistance.

    - **If infinite resistance**

      Repair the open/high resistance in the circuit between the X84B Auxiliary Data Connector and the first splice/device in the serial data circuit.

    - **If between 50 - 70 Ω**
12. Refer to Testing the Device Circuits.

Testing the Serial Data Circuits for a Short to Voltage

1. Vehicle OFF, disconnect the harness connectors with the high voltage energy management high speed GMLAN serial data circuits at an easily accessible device, Vehicle in Service Mode.
2. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
    - **If each serial data circuit is 4.5 V or less**
    1. Vehicle OFF.
    2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
        - If 10 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 10 Ω, replace the device that was disconnected.

- **If any serial data circuit is greater than 4.5 V**

3. Vehicle OFF, disconnect the harness connectors with the high voltage energy management high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to voltage, Vehicle in Service Mode.
4. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 4.5 V or less**
     1. Vehicle OFF.
     2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
        - If 10 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 10 Ω, replace the device that was disconnected.
   - **If any serial data circuit is greater than 4.5 V**
5. Repeat step 3 until one of the following conditions are isolated:
   - A short to voltage on the serial data circuit between two devices or splice packs, if equipped.
   - A short to voltage on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors with the high voltage energy management high speed GMLAN serial data circuits at an easily accessible device.
3. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 100 Ω or greater**

     Replace the device that was disconnected.

   - **If any serial data circuit is less than 100 Ω**
4. Disconnect the harness connectors with the high voltage energy management high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to ground.
5. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
   - **If both serial data circuits are 100 Ω or greater**

     Replace the device that was disconnected.

   - **If any serial data circuit is less than 100 Ω**
6. Repeat step 4 until one of the following conditions are isolated:
   - A short to ground on the serial data circuit between two devices or splice packs, if equipped.
   - A short to ground on the serial data circuit between a device and a terminating resistor.
   - A short to ground on the serial data circuit between the X84B auxiliary data connector and the first device or splice pack.

Testing the Serial Data Circuits for a Short between the Circuits

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors with the high voltage energy management high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
   - **If each pair of serial data circuits is 110 Ω or greater**

     Replace the device that was disconnected.

- **If any pair of serial data circuits is less than 110 Ω**

4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the high voltage energy management high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted together.
6. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 110 Ω or greater**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is less than 110 Ω**
7. Repeat step 4 until one of the following conditions are isolated:
    - Serial data circuits shorted together between two devices or splice packs, if equipped.
    - Serial data circuits shorted together between a device and a terminating resistor.
    - Serial data circuits shorted together between the X84B auxiliary data connector and the first device or splice pack.
    - A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors with the high voltage energy management high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for less than 130 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuit is 130 Ω or less**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is greater than 130 Ω**
4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the high voltage energy management high speed GMLAN serial data circuits at another device, in the direction of the circuit with the open/high resistance.
6. Test for less than 130 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 130 Ω or less**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is greater than 130 Ω**
7. Repeat step 4 until one of the following conditions are isolated:
    - An open/high resistance on the serial data circuit between two devices or splice packs, if equipped.
    - An open/high resistance on the serial data circuit between a device and a terminating resistor.
    - An open/high resistance terminating resistor.

Testing the Device Circuits

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors at an easily accessible device that is not communicating.
3. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.

   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Vehicle in Service Mode
5. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
6. Vehicle in Service Mode.
7. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
8. Vehicle in Service Mode
9. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, disconnect the harness connectors at the control module that controls the ignition circuit.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the control module that controls the ignition circuit.
   - **If the test lamp illuminates**
10. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
11. Test for less than 130 Ω between each pair of high voltage energy management high speed GMLAN serial data circuits at the device connector that was just disconnected.
    - **If any pair of serial data circuits is greater than 130 Ω**

Repair the open/high resistance in the serial data circuits between the disconnected device and the circuit splice in the serial data circuits.

- **If each pair of serial data circuits is 130 Ω or less**

12. Replace the device that was disconnected.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DTC U007B: CONTROL MODULE COMMUNICATION HIGH SPEED EXTENSION CAN BUS OFF

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U007B 00

Control Module Communication High Speed Extension CAN Bus Off

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Gateway Expansion High Speed GMLAN Serial Data (+) or High Speed GMLAN Serial Data (+) (8)	U007B	U007B	U007B	-
Gateway Expansion High Speed GMLAN Serial Data (-) or High Speed GMLAN Serial Data (-) (8)	U007B	U007B	U007B	-

Circuit/System Description

The devices connected to the gateway expansion high speed GMLAN serial data circuits (circuit numbers 3935 & 3936) monitor for serial data communications during normal vehicle operation. The K56 Serial Data Gateway Module acts as the gateway module between devices on primary high speed GMLAN bus and devices on gateway expansion high speed GMLAN bus. The gateway expansion high speed GMLAN serial data bus uses terminating resistors that are in parallel with the gateway expansion high speed GMLAN (+) and (-) circuits.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.

- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073, U0074, U0075, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Each device may need to be disconnected to isolate a circuit fault. Use the schematic to identify the following:**

- **Gateway expansion high speed GMLAN devices and terminating resistors the vehicle is equipped with**
- **Device locations on the gateway expansion high speed GMLAN serial data circuits**
- **Each device's ground, B+, ignition, and gateway expansion high speed GMLAN serial data circuit terminals**

Some devices with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate

failure mode short to voltage, short to ground, or open/high resistance prior to replacing the device for each of the following tests.

1. Ignition/Vehicle OFF, disconnect the harness connectors with the gateway expansion high speed GMLAN serial data circuits at an easily accessible device that is not communicating. Refer to **Data Link References** to determine which devices are on the gateway expansion high speed GMLAN bus.
2. Ignition ON/Vehicle In Service Mode.
3. Test for less than 4.5 V between each gateway expansion high speed GMLAN serial data circuit at the device that was just disconnected and ground.
    - **If 4.5 V or greater**

      Refer to Testing the Serial Data Circuits for a Short to Voltage.

    - **If less than 4.5 V**
4. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
5. Test for greater than 100 Ω between each gateway expansion high speed GMLAN serial data circuit at the device that was just disconnected and ground.
    - **If 100 Ω or less**

      Refer to Testing the Serial Data Circuits for a Short to Ground.

    - **If greater than 100 Ω**
6. Test for 110 - 130 Ω between each pair of the gateway expansion high speed GMLAN serial data circuits at the device that was just disconnected:
    - **If less than 110 Ω**

      Refer to Testing the Serial Data Circuits for a Short between the Circuits.

    - **If greater than 130 Ω**

      Refer to Testing the Serial Data Circuits for an Open/High Resistance.

    - **If between 110 - 130 Ω**
7. Refer to Testing the Device Circuits.

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition/Vehicle OFF, disconnect the harness connectors with the gateway expansion high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to voltage, ignition ON/Vehicle In Service Mode.
2. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
    - **If each serial data circuit is 4.5 V or less**
    1. Ignition/Vehicle OFF.
    2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
        - If 10 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 10 Ω, replace the device that was disconnected.
    - **If any serial data circuit is greater than 4.5 V**
3. Repeat step 1 until one of the following conditions are isolated:
    - A short to voltage on the serial data circuit between two devices or splice packs, if equipped.
    - A short to voltage on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors with the gateway expansion high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to ground.
3. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
    - **If each serial data circuit is 100 Ω or greater**

      Replace the device that was disconnected.

    - **If any serial data circuit is less than 100 Ω**
4. Repeat step 1 until one of the following conditions are isolated:
    - A short to ground on the serial data circuit between two devices or splice packs, if equipped.
    - A short to ground on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short between the Circuits

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Connect the harness connectors at the device that was previously disconnected.
3. Disconnect the harness connectors with the gateway expansion high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted together.
4. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 110 Ω or greater**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is less than 110 Ω**
5. Repeat step 2 until one of the following conditions are isolated:
    - Serial data circuits shorted together between two devices or splice packs, if equipped.
    - Serial data circuits shorted together between a device and a terminating resistor.
    - A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Connect the harness connectors at the device that was previously disconnected.
3. Disconnect the harness connectors with the gateway expansion high speed GMLAN serial data circuits at another device, in the direction of the circuit with the open/high resistance.
4. Test for less than 130 Ω between each pair of the serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 130 Ω or less**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is greater than 130 Ω**
5. Repeat step 2 until one of the following conditions are isolated:
    - An open/high resistance on the serial data circuit between two devices or splice packs, if equipped.
    - An open/high resistance on the serial data circuit between a device and a terminating resistor.
    - An open/high resistance terminating resistor.

Testing the Device Circuits

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal at the device that was just disconnected and ground.
   - **If 10 Ω or greater**
   1. Ignition/Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
4. Ignition ON/Vehicle In Service Mode.
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
   - **If the test lamp does not illuminate**
   1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the control module that controls the ignition circuit.
   - **If the test lamp illuminates**
7. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K56 Serial Data Gateway

Module. It may take up to 2 min for all vehicle systems to power down.

8. Test for less than 2 Ω in each of the gateway expansion high speed GMLAN serial data circuits end to end between the non communicating device and the K56 Serial Data Gateway Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
9. Test for less than 2 Ω in each of the primary high speed GMLAN serial data circuits (circuit numbers 2500 & 2501) end to end between the K56 Serial Data Gateway Module and the appropriate X84 Data Link Connector (DLC) terminals listed below.
    - X84 Data Link Connector high speed GMLAN serial data circuit terminal 6
    - X84 Data Link Connector high speed GMLAN serial data circuit terminal 14
    - **If 2 Ω or greater**

      Repair the open/high resistance in the high speed GMLAN serial data circuit.

    - **If less than 2 Ω**
10. Replace the non communicating device that was disconnected.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DTC U007C: CONTROL MODULE COMMUNICATION HIGH SPEED EXTENSION CAN BUS 2 OFF

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U007C 00

Control Module Communication High Speed Extension CAN Bus 2 Off

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Gateway Isolated High Speed GMLAN Serial Data (+) or High Speed GMLAN Serial Data (+) (9)	U007C	U007C	U007C	-
Gateway Isolated High Speed GMLAN Serial Data (-) or High Speed GMLAN Serial Data (-) (9)	U007C	U007C	U007C	-

Circuit/System Description

The devices connected to the gateway isolated high speed GMLAN serial data circuits (circuit numbers 1304 & 1305) monitor for serial data communications during normal vehicle operation. The K56 Serial Data Gateway Module acts as the gateway module between devices on primary high speed GMLAN bus and devices on gateway isolated high speed GMLAN bus. The gateway isolated high speed GMLAN serial data bus uses terminating resistors that are in parallel with the gateway isolated high speed GMLAN (+) and (-) circuits.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073, U0074, U0075, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Each device may need to be disconnected to isolate a circuit fault. Use the schematic to identify the following:**

- **Gateway isolated high speed GMLAN devices and terminating resistors the vehicle is equipped with**
- **Device locations on the gateway isolated high speed GMLAN serial data circuits**
- **Each device's ground, B+, ignition, and gateway isolated high speed GMLAN serial data circuit terminals**

Some devices with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the device for each of the following tests.

1. Ignition/Vehicle OFF, disconnect the harness connectors with the gateway isolated high speed GMLAN serial data circuits at an easily accessible device that is not communicating. Refer to Data Link References to determine which devices are on the gateway isolated high speed GMLAN bus.
2. Ignition ON/Vehicle In Service Mode.
3. Test for less than 4.5 V between each gateway isolated high speed GMLAN serial data circuit at the device that was just disconnected and ground.
   - **If 4.5 V or greater**

     Refer to Testing the Serial Data Circuits for a Short to Voltage.
   - **If less than 4.5 V**
4. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
5. Test for greater than 100 Ω between each gateway isolated high speed GMLAN serial data circuit at the device that was just disconnected and ground.
   - **If 100 Ω or less**

     Refer to Testing the Serial Data Circuits for a Short to Ground.
   - **If greater than 100 Ω**
6. Test for 110 - 130 Ω between each pair of the gateway isolated high speed GMLAN serial data circuits at the device that was just disconnected:
   - **If less than 110 Ω**

     Refer to Testing the Serial Data Circuits for a Short between the Circuits.
   - **If greater than 130 Ω**

     Refer to Testing the Serial Data Circuits for an Open/High Resistance.
   - **If between 110 - 130 Ω**
7. Refer to Testing the Device Circuits.

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition/Vehicle OFF, disconnect the harness connectors with the gateway isolated high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to voltage, ignition ON/Vehicle In Service Mode.
2. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 4.5 V or less**

   1. Ignition/Vehicle OFF.
   2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
      - If 10 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 10 Ω, replace the device that was disconnected.
   - **If any serial data circuit is greater than 4.5 V**
3. Repeat step 1 until one of the following conditions are isolated:
   - A short to voltage on the serial data circuit between two devices or splice packs, if equipped.
   - A short to voltage on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors with the gateway isolated high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to ground.
3. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 100 Ω or greater**

     Replace the device that was disconnected.

   - **If any serial data circuit is less than 100 Ω**
4. Repeat step 1 until one of the following conditions are isolated:
   - A short to ground on the serial data circuit between two devices or splice packs, if equipped.
   - A short to ground on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short between the Circuits

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Connect the harness connectors at the device that was previously disconnected.
3. Disconnect the harness connectors with the gateway isolated high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted together.
4. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
   - **If each pair of serial data circuits is 110 Ω or greater**

     Replace the device that was disconnected.

   - **If any pair of serial data circuits is less than 110 Ω**
5. Repeat step 2 until one of the following conditions are isolated:
   - Serial data circuits shorted together between two devices or splice packs, if equipped.
   - Serial data circuits shorted together between a device and a terminating resistor.
   - A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Connect the harness connectors at the device that was previously disconnected.
3. Disconnect the harness connectors with the gateway isolated high speed GMLAN serial data circuits at another device, in the direction of the circuit with the open/high resistance.
4. Test for less than 130 Ω between each pair of the serial data circuits at the device connector that was just disconnected.
   - **If each pair of serial data circuits is 130 Ω or less**

Replace the device that was disconnected.

- **If any pair of serial data circuits is greater than 130 Ω**

5. Repeat step 2 until one of the following conditions are isolated:
    - An open/high resistance on the serial data circuit between two devices or splice packs, if equipped.
    - An open/high resistance on the serial data circuit between a device and a terminating resistor.
    - An open/high resistance terminating resistor.

Testing the Device Circuits

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal at the device that was just disconnected and ground.
    - **If 10 Ω or greater**
    1. Ignition/Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the disconnected device.
    - **If the test lamp illuminates**
4. Ignition ON/Vehicle In Service Mode.
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the disconnected device.
    - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
    - **If the test lamp does not illuminate**

    1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the control module that controls the ignition circuit.
  - **If the test lamp illuminates**

7. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K56 Serial Data Gateway Module. It may take up to 2 min for all vehicle systems to power down.
8. Test for less than 2 Ω in each of the gateway isolated high speed GMLAN serial data circuits end to end between the non communicating device and the K56 Serial Data Gateway Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
9. Test for less than 2 Ω in each of the primary high speed GMLAN serial data circuits (circuit numbers 2500 & 2501) end to end between the K56 Serial Data Gateway Module and the appropriate X84 Data Link Connector (DLC) terminals listed below.
    - X84 Data Link Connector high speed GMLAN serial data circuit terminal 6
    - X84 Data Link Connector high speed GMLAN serial data circuit terminal 14
    - **If 2 Ω or greater**

      Repair the open/high resistance in the primary high speed GMLAN serial data circuit.

    - **If less than 2 Ω**
10. Replace the non communicating device that was disconnected.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Serial Data Circuit Wiring Repairs
- Control Module References for device replacement, programming and setup

DTC U007D: CONTROL MODULE COMMUNICATION LOW SPEED EXTENSION CAN BUS OFF

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC U007D 00

Control Module Communication Low Speed Extension CAN Bus Off

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Gateway Isolated Low Speed GMLAN Serial Data or Low Speed GMLAN Serial Data #2 (Circuit #1102)	U007D	U0100-U02FF	U007D	-

Circuit/System Description

The gateway isolated low speed GMLAN serial data bus is used to communicate information between the devices. The serial data is transmitted over a single wire (circuit number 1102) to the appropriate devices. The K56 Serial Data Gateway Module acts as the gateway module between devices on low speed GMLAN bus and devices on gateway isolated low speed GMLAN bus.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073, U0074, U0075, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Attempt to communicate with all devices on the gateway isolated low speed GMLAN serial data circuit. Refer to **Data Link References** to determine which devices are on the gateway isolated low speed GMLAN bus.
4. Verify that all gateway isolated low speed GMLAN devices are communicating.
    - **If only one device is not communicating**

      Refer to Circuit/System Testing - Testing the Device Circuits.

    - **If all devices are not communicating, except the K56 Serial Data Gateway Module**

      Refer to Circuit/System Testing.

    - **If two or more devices are not communicating but not all, except the K56 Serial Data Gateway Module**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for an Open/High Resistance.

    - **If all devices are communicating**
5. All OK.

Circuit/System Testing

NOTE: **Use the schematic to identify the following:**

- **Gateway isolated low speed GMLAN devices the vehicle is equipped with**
- **Device and splice pack locations on the gateway isolated low speed GMLAN serial data circuit**
- **The gateway isolated low speed GMLAN serial data circuit terminals for each device or splice pack**

1. Ignition/Vehicle OFF, disconnect the harness connectors at the K56 Serial Data Gateway Module, ignition ON/Vehicle In Service Mode.
2. Test for less than 4.5 V between each gateway isolated low speed GMLAN serial data circuit at the K56 Serial Data Gateway Module and ground.
    - **If any serial data circuit is greater than 4.5 V**

      Refer to Testing the Serial Data Circuits for a Short to Voltage.

    - **If all serial data circuits are less than 4.5 V**
3. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
4. Test for greater than 100 Ω between each gateway isolated low speed GMLAN serial data circuit at the K56 Serial Data Gateway Module and ground.
    - **If any serial data circuit is 100 Ω or less**

      Refer to Testing the Serial Data Circuits for a Short to Ground.

    - **If all serial data circuits are greater than 100 Ω**

5. Test for less than 2 Ω in the primary low speed GMLAN serial data circuit (circuit number 5060) end to end between the K56 Serial Data Gateway Module and X84 Data Link Connector terminal 1.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the low speed GMLAN serial data circuit.

    - **If less than 2 Ω**
6. If equipped, inspect all gateway isolated low speed GMLAN splice packs for damage.
7. Repair the open/high resistance in the gateway isolated low speed GMLAN serial data circuit between the K56 Serial Data Gateway Module and the closest splice (or the closest gateway isolated low speed GMLAN device).

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition/Vehicle OFF.
    - For vehicles equipped with splice packs, disconnect the appropriate harness connectors at all gateway isolated low speed GMLAN serial data splice packs.
    - For vehicles equipped with sonic splices, cut the appropriate harness at a gateway isolated low speed GMLAN serial data splice closest to the K56 Serial Data Gateway Module, at least 40 mm (1.57 in) from the splice. Do not cut the wires right at the splice because these wires need to be repaired after the test is done.
2. Ignition ON/Vehicle In Service Mode.
3. Test for less than 4.5 V between each gateway isolated low speed GMLAN serial data circuit at a splice pack (or splice) and ground.
    - **If any serial data circuit is 4.5 V or greater**
    1. Ignition/Vehicle OFF, reconnect (or repair) all serial data circuits at the tested splice pack (or splice) except the failed serial data circuit, ignition ON/Vehicle In Service Mode.
    2. Verify the gateway isolated low speed GMLAN devices that are still not communicating to identify the failed serial data circuit.
    3. Ignition/Vehicle OFF, disconnect all devices on the failed serial data circuit, ignition ON/Vehicle In Service Mode.
    4. Test for less than 1 V between each section of the failed serial data circuit and ground.
        - If 1 V or greater, repair the short to voltage in the serial data circuit.
        - If less than 1 V
    5. Ignition/Vehicle OFF, reconnect (or repair) the failed serial data circuit to the splice pack (or splice) and connect the first device on the failed serial data circuit, ignition ON/Vehicle In Service Mode.
    6. Verify the scan tool communicates or not with the gateway isolated low speed GMLAN serial data circuit.
        - If the scan tool does not communicate, replace the device that was just connected.
        - If the scan tool communicates and there are more devices to connect, connect the next device and repeat step 3.6.
        - If the scan tool communicates and there are no more devices to connect
    7. All OK.
    - **If each serial data circuit is less than 4.5 V**
4. Inspect all gateway isolated low speed GMLAN splice packs (or splices) for damage.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
    - For vehicles equipped with splice packs, disconnect the appropriate harness connectors at all gateway isolated low speed GMLAN serial data splice packs.
    - For vehicles equipped with sonic splices, cut the appropriate harness at a gateway isolated low speed GMLAN serial data splice closest to the K56 Serial Data Gateway Module, at

least 40 mm (1.57 in) from the splice. Do not cut the wires right at the splice because these wires need to be repaired after the test is done.

2. Test for greater than 100 Ω between each gateway isolated low speed GMLAN serial data circuit at a splice pack (or splice) and ground.
   - **If any serial data circuit is 100 Ω or less**
   1. Reconnect (or repair) all serial data circuits at the tested splice pack (or splice) except the failed serial data circuit, ignition ON/Vehicle In Service Mode.
   2. Verify the gateway isolated low speed GMLAN devices that are still not communicating to identify the failed serial data circuit.
   3. Ignition/Vehicle OFF, disconnect all devices on the failed serial data circuit.
   4. Test for infinite resistance between each section of the failed serial data circuit and ground.
      - If less than infinite resistance, repair the short to ground in the serial data circuit.
      - If infinite resistance
   5. Reconnect (or repair) the failed serial data circuit to the splice pack (or splice) and connect the first device on the failed serial data circuit, ignition ON/Vehicle In Service Mode.
   6. Verify the scan tool communicates or not with the gateway isolated low speed GMLAN serial data circuit.
      - If the scan tool does not communicate, replace the device that was just connected.
      - If the scan tool communicates and there are more devices to connect, connect the next device and repeat step 2.6.
      - If the scan tool communicates and there are no more devices to connect
   7. All OK.
   - **If each serial data circuit is greater than 100 Ω**
3. Inspect all gateway isolated low speed GMLAN splice packs (or splices) for damage.

Testing the Serial Data Circuits for an Open/High Resistance

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors at the gateway isolated low speed GMLAN device that is not communicating and closest to the K56 Serial Data Gateway Module.
3. Disconnect the harness connectors at the K56 Serial Data Gateway Module.
4. Test for less than 2 Ω in the gateway isolated low speed GMLAN serial data circuit (circuit number 1102) end to end between the non-communicating device and the K56 Serial Data Gateway Module.
   - **If 2 Ω or greater**

     Repair the open/high resistance in the serial data circuit.

   - **If less than 2 Ω**
5. Test for less than 2 Ω in the primary low speed GMLAN serial data circuit (circuit number 5060) end to end between the K56 Serial Data Gateway Module and the X84 Data Link Connector terminal 1.
   - **If 2 Ω or greater**

     Repair the open/high resistance in the serial data circuit.

   - **If less than 2 Ω**
6. Replace the non-communicating device that was disconnected.

Testing the Device Circuits

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the gateway isolated low speed GMLAN device that is not communicating. It may take up to 2 min for all vehicle systems to power down.

2. Test for less than 10 Ω between each ground circuit terminal at the device that was just disconnected and ground.
    - **If 10 Ω or greater**
    1. Ignition/Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the disconnected device.
    - **If the test lamp illuminates**
4. Ignition ON/Vehicle In Service Mode.
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the disconnected device.
    - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
    - **If the test lamp does not illuminate**
    1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the control module that controls the ignition circuit.
    - **If the test lamp illuminates**
7. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K56 Serial Data Gateway Module. It may take up to 2 min for all vehicle systems to power down.

8. Test for less than 2 Ω in each of the gateway isolated low speed GMLAN serial data circuits end to end between the non communicating device and the K56 Serial Data Gateway Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.
    - **If less than 2 Ω**
9. Test for less than 2 Ω in the primary low speed GMLAN serial data circuit (circuit number 5060) end to end between the K56 Serial Data Gateway Module and X84 Data Link Connector terminal 1.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the low speed GMLAN serial data circuit.
    - **If less than 2 Ω**
10. Replace the non communicating device that was disconnected.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

1. Scan Tool Does Not Communicate With Most Low Speed GMLAN Device 2. Scan Tool Does Not Communicate With Most High Speed GMLAN Device				

Circuit/System Description

The serial data circuit is the means by which the devices in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the Data Link Connector (DLC) on the driver side, the scan tool can be used to monitor each device for diagnostic purposes and to check for diagnostic trouble codes (DTCs). The Auxiliary Data Connector on the passenger side is used for expansion buses. When the vehicle is on, each device communicating on the serial data circuit sends a state of health message to ensure that the device is operating properly. When a device stops communicating on the serial data circuit, for example if the device loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other devices on the serial data circuit, which expect to receive that state of health message, detect its absence; those devices in turn set a DTC associated with the loss of state of health of the non-communicating device. The DTC is unique to the device which is not communicating and one or more devices may set the same exact code. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored DTC.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

- Specific subsystems will not function.
- DTC U0100 in the Transmission Control Module will cause the transmission to go into default gears.
- Both DTC U0100 in the Transmission Control Module and DTC U0101 in the Engine Control Module will cause the malfunction indicator lamp (MIL) to illuminate.

Conditions for Clearing the DTC

- The Engine Control Module or Transmission Control Module turns OFF the MIL after 4 consecutive ignition cycles that the diagnostic runs and does not fail.
- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:

    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between some devices and the scan tool with either the low or high speed GMLAN serial data system inoperative. This condition is due to those devices using multiple serial data communication systems.
- Use **Data Link References** to determine what serial data communications the device uses.
- Some devices may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the device.
- Some intermittent communication concerns may be caused by fretting corrosion on the serial data circuit terminals. Inspect all connectors at the device that set the communication DTC, the device that the communication DTC was set against, and any inline harness connectors between the two devices. Do not replace a device based only on fretting corrosion. Refer to bulletin 09-06-03-004 for assistance with the diagnosis and repair of this condition, if applicable.
- This diagnostic can be used for any device that is not communicating, regardless of the type of serial data circuit it is connected to, providing the vehicle is equipped with the device.
- This diagnostic procedure can be used to diagnose the common no communication DTCs: U0100, U0101, U0102, U0103, U0104, U0105, U0106, U0109, U010E, U010F, U0111, U0112, U0115, U0117, U0121, U0122, U0123, U0125, U0126, U0128, U0129, U012A, U0130, U0131, U0132, U0133, U0136, U0137, U0139, U0140, U0146, U0151, U0155, U0158, U0159, U0160, U0164, U0166, U0167, U0168, U016B, U0170, U0181, U0182, U0184, U0186, U0191, U0193, U0196, U0197, U0198, U0201, U0203, U0204, U0207, U0208, U0209, U0210, U0230, U0232, U0233, U0236, U0237, U023A, U0248, U0249, U0250, U0252, U0254, U025B, U0264, U0265, U0268, U0269, U026A, U026B, U0293, U029D, U029E, U02A3, and other DTCs within U0100 - U02FF range.

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073, U0074, U0075, U0077, U0078, U007A, U007B, U007C, U007D, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

   - **If none of the DTCs are set**
3. Verify that the K56 Serial Data Gateway Module is communicating.
   - **If the K56 Serial Data Gateway Module is not communicating**

     Refer to Circuit/System Testing to diagnose the K56 Serial Data Gateway Module first.

   - **If the K56 Serial Data Gateway Module is communicating**
4. Determine the device that is not communicating. Refer to Control Module U Code List.
5. Refer to Data Link References to determine which data communication bus the non communicating device is on.
   - **If the device is on Gateway Expansion High Speed GMLAN bus**

     Refer to Scan Tool Does Not Communicate with Gateway Expansion High Speed GMLAN Device to diagnose that device.

   - **If the device is on Gateway Isolated High Speed GMLAN bus**

     Refer to Scan Tool Does Not Communicate with Gateway Isolated High Speed GMLAN Device to diagnose that device.

   - **If the device is on Gateway Isolated Low Speed GMLAN bus**

     Refer to Scan Tool Does Not Communicate with Gateway Isolated Low Speed GMLAN Device to diagnose that device.

   - **If the device is not on Gateway Expansion High Speed GMLAN bus, Gateway Isolated High Speed GMLAN bus, and Gateway Isolated Low Speed GMLAN bus**
6. Refer to Circuit/System Testing.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must**

be followed.

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wakeup serial data, serial data communication enable, accessory wakeup serial data 2, high voltage energy management communication enable, and serial data circuit terminals.**

1. Using the High Voltage Device Chart below, verify that the non-communicating device is not a high voltage device. If the device is a high voltage device, perform the High Voltage Disabling procedure before proceeding with this diagnostic. Refer to **High Voltage Disabling** .
2. If high voltage disabling is required, reconnect the 12 V battery after performing the high voltage disabling procedure.
3. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect all the harness connectors at the device that is not communicating. It may take up to 2 min for all vehicle systems to power down.
4. Test for less than 10 Ω between each ground circuit terminal and ground.
   - **If 10 Ω or greater**
   1. Ignition/Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
5. Ignition ON/Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
7. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.

        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the disconnected device.
    - **If the test lamp illuminates**

NOTE: **Accessory wakeup serial data, serial data communication enable, accessory wakeup serial data 2, and high voltage energy management communication enable circuits are ignition circuits controlled by another control module.**

8. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
    - **If the test lamp does not illuminate**
    1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the control module that controls the ignition circuit.
    - **If the test lamp illuminates**
9. Test for less than 4.5 V between each GMLAN serial data circuit terminal and ground.
    - **If 4.5 V or greater between a low speed GMLAN serial data circuit and ground**

      Refer to Scan Tool Does Not Communicate with Low Speed GMLAN Device to test for a short to voltage.

    - **If 4.5 V or greater between a high speed GMLAN serial data circuit and ground**

      Refer to Scan Tool Does Not Communicate with High Speed GMLAN Device to test for a short to voltage.

    - **If less than 4.5 V**
10. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
11. Test for greater than 100 Ω between each GMLAN serial data circuit terminal and ground.
    - **If 100 Ω or less between a low speed GMLAN serial data circuit and ground**

      Refer to Scan Tool Does Not Communicate with Low Speed GMLAN Device to test for a short to ground.

    - **If 100 Ω or less between a high speed GMLAN serial data circuit and ground**

      Refer to Scan Tool Does Not Communicate with High Speed GMLAN Device to test for a short to ground.

    - **If greater than 100 Ω**
12. Test for less than 2 Ω in each of the serial data circuits end to end between the device harness connector and the appropriate X84 Data Link Connector terminals listed below:
    - X84 DLC low speed GMLAN serial data circuit terminal 1
    - X84 DLC high speed GMLAN serial data circuit terminal 6 or 14

- X84 DLC object high speed GMLAN serial data circuit terminal 3 or 11
- X84 DLC chassis high speed GMLAN serial data circuit terminal 12 or 13
- **If 2 Ω or greater**

  Repair the open/high resistance in the serial data circuit between the non communicating device and the device setting the DTC or a serial data splice pack.

- **If less than 2 Ω**

NOTE: **The following test step is only applicable to a high speed GMLAN device with 2 pairs of serial data circuits or a high speed GMLAN device with an internal terminating resistor.**

13. Test for 110 - 130 Ω between each pair of high speed GMLAN serial data circuits.
    - **If less than 110 Ω**

      Refer to Scan Tool Does Not Communicate with High Speed GMLAN Device to test for a short to ground or a short between the serial data circuits.

    - **If greater than 130 Ω**

      Refer to Scan Tool Does Not Communicate with High Speed GMLAN Device to test for an open/high resistance in the serial data circuit.

    - **If between 110 - 130 Ω**
14. Replace the device that is not communicating.

High Voltage Device Chart

Device	Voltage System	Data Link Type
K16 Battery Energy Control Module (BECM)	300 V 12 V	• High Voltage Energy Management High Speed GMLAN • High Speed GMLAN • BECM Dedicated Bus

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Serial Data Circuit Wiring Repairs
- Control Module References for device replacement, programming and setup

DTC U0300-U0336: SOFTWARE INCOMPATIBILITY

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

Refer to Control Module U Code List.

Circuit/System Description

Some devices must be configured with specific software, serial numbers, vehicle options, or other information. If a device was not properly configured after installation that device may set the appropriate communication DTCs. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9 - 16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

DTC U0400-U05FF: INVALID DATA RECEIVED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

Refer to **Control Module U Code List**.

Circuit/System Description

Some devices are constantly receiving information from other devices through serial data communication network. The invalid data code will be set when a receiving device detects a discrepancy in information it receives from another device causing its integrity to be questioned. The symptom byte listed in the DTC Descriptor is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9 - 16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC U0073, U0074, U0075, U0076, U0077, U0078, U2100, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wakeup serial data, and serial data circuit terminals.**

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K69 Transfer Case Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K69 Transfer Case Control Module.
    - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K69 Transfer Case Control Module.
    - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the accessory wakeup serial data circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Ignition OFF, remove the test lamp, disconnect the harness connectors at the K9 Body Control Module.
    2. Test for infinite resistance between the accessory wakeup serial data circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
7. Test for less than 4.5 V between each high speed GMLAN serial data circuit terminal and ground.
    - **If 4.5 V or greater**

Refer to **Scan Tool Does Not Communicate with High Speed GMLAN Device** to test for a short to voltage.

- **If less than 4.5 V**

8. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
9. Test for greater than 100 Ω between each high speed GMLAN serial data circuit terminal and ground.
    - **If 100 Ω or less**

      Refer to **Scan Tool Does Not Communicate with High Speed GMLAN Device** to test for a short to ground.

    - **If greater than 100 Ω**
10. Disconnect the harness connectors at the device setting the DTC.
11. Test for less than 2 Ω in each serial data circuits end to end between the K69 Transfer Case Control Module and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
12. Replace the K69 Transfer Case Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DTC U1340-U135F: CHASSIS/ENGINE CONTROL MODULE, LOST COMMUNICATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

For device DTC descriptors, refer to **Control Module U Code List**.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U1340-U135F	U1340-U135F	-	-
Ignition	U1340-U135F	U1340-U135F	-	-
LIN Serial Data	U1340-U135F	U1340-U135F	U1340-U135F	-
Ground	-	U1340-U135F	-	-

Circuit/System Description

The Local Interconnect Network (LIN) Bus consists of a single wire with a transmission rate of 10.417 Kbit/s. The serial data is transmitted over a LIN circuit between a master control module and other LIN devices within a particular subsystem. If serial data communication is lost between any of the LIN devices on the LIN bus network, the master control module will set a no communication code against the non-communicating LIN device.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Some devices may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the device.
- An open in the LIN bus serial data circuit between the splice pack and a LIN device will only affect that specific LIN device. This type of failure will set a loss of communication DTC for each LIN device affected and the other LIN devices will still communicate.
- This diagnostic procedure can be used to diagnose the common LIN DTCs: U1340, U1341, U1342, U1343, U1344, U1345, U1346, U1347, U1348, U1349, U134A, U134B, U134C, U134D, U134E, U134F, U1350, U1351, U1352, U1353, U1354, U1355, U1356, U1357, U1358, U1359, U135A, U135B, U135C, U135D, U135E, and U135F.

Circuit/System Verification

1. Determine the LIN device that is not communicating. Refer to **Control Module U Code List**.
2. Vehicle in Service Mode.
3. Verify that DTC B1325, B1330, B1370, B1380, B1424, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
4. Verify that DTC U0100 - U02FF is not set.
    - **If any of the DTCs are set**

      Refer to **DTC U0100-U02FF**.

    - **If none of the DTCs are set**
5. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics to determine the master control module and all LIN devices on the same LIN serial data circuit. Use the connector end views to identify the B+, ignition, ground, and LIN serial data circuit terminals for each of those devices.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the harness connector at a LIN device that is not communicating.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp.
2. Test for less than 2 Ω in the B+ circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF, remove the test lamp.
2. Test for infinite resistance between the B+ circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the disconnected LIN device.

- **If the test lamp illuminates**

5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.

- **If the test lamp does not illuminate and the circuit fuse is good**

1. Vehicle OFF, remove the test lamp.
2. Test for less than 2 Ω in the ignition circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Vehicle OFF, remove the test lamp.
2. Test for infinite resistance between the ignition circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance, replace the disconnected LIN device.

- **If the test lamp illuminates**

6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.

- **If the test lamp does not illuminate**

1. Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
2. Test for infinite resistance between the ignition circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the ignition circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the control module that controls the ignition circuit.

- **If the test lamp illuminates**

NOTE: **For accurate voltage reading, disconnect the battery charger prior to performing the following test step.**

7. Test for 2 - 12 V between the LIN serial data circuit terminal and ground.

- **If less than 2 V**

1. Vehicle OFF, disconnect the harness connector at the control module setting the DTC and all LIN devices that share the same LIN serial data circuit.
2. Test for infinite resistance between the serial data circuit and ground.
    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
3. Test for less than 2 Ω in the serial data circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω
4. Reconnect the control module that set the DTC, Vehicle in Service Mode.
5. Test for 2 - 12 V between the LIN serial data circuit terminal and ground.

        - If less than 2 V, replace the control module setting the DTC.
        - If greater than 2 V, replace the LIN device that causes a current DTC to set when connected.
    - **If greater than 12 V**
    1. Vehicle OFF, disconnect the harness connector at the control module setting the DTC and all LIN devices that share the same LIN serial data circuit.
    2. Vehicle in Service Mode.
    3. Test for less than 1 V between the serial data circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    4. Vehicle OFF, reconnect the control module that set the DTC, Vehicle in Service Mode.
    5. Test for 2 - 12 V between the LIN serial data circuit terminal and ground.
        - If greater than 12 V, replace the control module setting the DTC.
        - If less than 12 V, replace the LIN device that causes a current DTC to set when connected.
    - **If between 2 - 12 V**

8. Replace the disconnected LIN device.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DTC U1500-U15FF: LIN BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

For device DTC descriptors, refer to **Control Module U Code List**.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U1500-U15BF	U1500-U15BF	-	-
Ignition	U1500-U15BF	U1500-U15BF	-	-
LIN Serial Data	U1500-U15BF	U1500-U15BF	U1500-U15BF	-
Ground	-	U1500-U15BF	-	-

Circuit/System Description

The serial data is transmitted over a Local Interconnect Network (LIN) single wire network circuit bus between a master control module and other LIN devices within a particular subsystem. If serial data communication is lost between any of the LIN devices on the LIN bus network, a no communication code against the non-communicating LIN device will be set. A master control module is the one that reports the non communication code. A loss of serial data communications DTC does not represent a failure of the master control module that set it.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication will be available between the master control module and the scan tool if there is a loss of communications with any of the other LIN devices on the LIN bus network.
- Some devices may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the device.
- Some intermittent communication concerns may be caused by fretting corrosion on the serial data circuit terminals. Inspect all connectors at the device that set the communication DTC, the device that the communication DTC was set against, and any inline harness connectors between the two devices. Do not replace a device based only on fretting corrosion. Refer to bulletin 09-06-03-004 for assistance with the diagnosis and repair of this condition, if applicable.
- An open in the LIN bus serial data circuit between the splice pack and a LIN device will only affect that specific LIN device. This type of failure will set a loss of communication DTC for each LIN device affected and the other LIN devices will still communicate.
- This diagnostic procedure can be used to diagnose the common LIN DTCs: U1500, U1501, U1502, U1503, U1504, U1505, U1506, U1507, U1508, U1509, U150E, U150F, U1510, U1511, U1512, U1513, U1514, U1515, U1516, U1517, U1518, U1519, U151A, U151B, U151C, U1520, U1521, U1522, U1523, U1524, U1526, U1528, U152C, U152D, U1530, U1531, U1532, U1534, U1538, U153A, U1540, U1544, U1548, U1549, U154A, U154B, U1550, U1556, U1558, U15E1, U15E3, U15F0, and other DTCs within the U1500 - U15FF range.

Circuit/System Testing

NOTE: **Use the schematics to determine the master control module and all LIN devices on the same LIN serial data circuit. Use the connector end view to identify the B+, ignition, ground, and LIN serial data circuit terminals for each of those devices.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the harness connector at a LIN device that is not communicating.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between each B+ circuit terminal and ground, if equipped.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the disconnected LIN device.
    - **If the test lamp illuminates**
5. Verify a test lamp illuminates between each ignition circuit terminal and ground, if equipped.
    - **If the test lamp does not illuminate and the circuit fuse is good**

   1. Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected LIN device.
   - **If the test lamp illuminates**

6. Verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground, if equipped.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the control module that controls the ignition circuit.
   - **If the test lamp illuminates**

NOTE: **For accurate voltage reading, disconnect the battery charger prior to performing the following test step.**

7. Test for 2 - 12 V between the LIN serial data circuit terminal and ground.
   - **If less than 2 V**
   1. Vehicle OFF, disconnect the harness connector at the control module setting the DTC and all LIN devices that share the same LIN serial data circuit.
   2. Test for infinite resistance between the serial data circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the serial data circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω
   4. Reconnect the control module that set the DTC, Vehicle in Service Mode.
   5. Test for 2 - 12 V between the LIN serial data circuit terminal and ground.
      - If less than 2 V, replace the control module setting the DTC.
      - If greater than 2 V, replace the LIN device that causes a current DTC to set when connected.
   - **If greater than 12 V**
   1. Vehicle OFF, disconnect the harness connector at the control module setting the DTC and all LIN devices that share the same LIN serial data circuit.
   2. Vehicle in Service Mode.
   3. Test for less than 1 V between the serial data circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   4. Vehicle OFF, reconnect the control module that set the DTC, Vehicle in Service Mode.
   5. Test for 2 - 12 V between the LIN serial data circuit terminal and ground.
      - If greater than 12 V, replace the control module setting the DTC.

        - If less than 12 V, replace the LIN device that causes a current DTC to set when connected.
    - **If between 2 - 12 V**

8. Replace the disconnected LIN device.

Repair Instructions

DTC U1653: CHASSIS SYSTEMS HIGH SPEED COMMUNICATION ENABLE CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC U1653

Chassis Systems High Speed Communication Enable Circuit

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Serial Data Communication Enable	U2099	U0100-U02FF, U1653	1	-
Chassis High Speed GMLAN Serial Data (+) or High Speed GMLAN Serial Data (+) (2)	U0077	U0100-U02FF, U1653	U0077	-
Chassis High Speed GMLAN Serial Data (-) or High Speed GMLAN Serial Data (-) (2)	U0077	U0100-U02FF, U1653	U0077	-
1. Battery drain condition may occur.				

Circuit/System Description

The Body Control Module (BCM) activates the ignition circuit, when the vehicle power mode is in ACCESSORY mode or Ignition ON/Vehicle In Service mode. The ignition circuit wakes up the devices for serial data bus communication.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the chassis high speed GMLAN serial data circuits more than 3 times.

Action Taken When the DTC Sets

- The devices use a default value for the missing parameters until the next ignition cycle.

- The device(s) is never signaled. Therefore, the specific subsystem(s) will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073 - U007F, U2100, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematic and the connector end view to identify the device's serial data communication enable circuit and chassis high speed GMLAN serial data circuit terminals.**

1. Ignition/Vehicle OFF, disconnect the harness connectors at the device setting this DTC, ignition ON/Vehicle In Service Mode.
2. Verify a test lamp illuminates between the serial data communication enable circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the K9 Body Control Module.
    2. Test for infinite resistance between the serial data communication enable circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.

        - If infinite resistance
    3. Test for less than 2 Ω in the serial data communication enable circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
3. Test for less than 4.5 V between each chassis high speed GMLAN serial data circuit terminal and ground.
    - **If 4.5 V or greater**

      Refer to DTC U0077 to test for a short to voltage.

    - **If less than 4.5 V**
4. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
5. Test for greater than 100 Ω between each chassis high speed GMLAN serial data circuit terminal and ground.
    - **If 100 Ω or less**

      Refer to DTC U0077 to test for a short to ground.

    - **If greater than 100 Ω**
6. Test for less than 2 Ω in each of the chassis high speed GMLAN serial data circuits end to end between the harness connector at the device setting this DTC and the appropriate X84 Data Link Connector terminals listed below.
    - Chassis high speed GMLAN serial data circuit terminal 12
    - Chassis high speed GMLAN serial data circuit terminal 13
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
7. Replace the device setting this DTC.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Serial Data Circuit Wiring Repairs
- Control Module References for device replacement, programming and setup

DTC U179A: LOST COMMUNICATION WITH HYBRID POWERTRAIN CONTROL MODULE 2

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

1. Scan Tool Does Not Communicate With Low Speed GMLAN Device 2. Scan Tool Does Not Communicate With High Speed GMLAN Device				

Circuit/System Description

The serial data circuit is the means by which the devices in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the Data Link Connector (DLC), the scan tool can be used to monitor each device for diagnostic purposes and to check for diagnostic trouble codes (DTC). When the vehicle is on, each device communicating on the serial data circuit sends a state of health message to ensure that the device is operating properly. When a device stops communicating on the serial data circuit, for example if the device loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other devices on the serial data circuit, which expect to receive that state of health message, detect its absence; those devices in turn set a DTC associated with the loss of state of health of the non communicating device. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored DTC.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

DTC U179A is a type A DTC.

Conditions for Clearing the DTC

DTC U179A is a type A DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:

    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0073, U0074, U0077, U0078, U007A, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
    - **If none of the DTCs are set**

3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data, and serial data circuit terminals.

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
7. Vehicle in Service Mode.
8. If equipped, verify a test lamp illuminates between the accessory wakeup serial data circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the harness connectors at the K9 Body Control Module.
    2. Test for infinite resistance between the accessory wakeup serial data circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.

        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**

9. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 min for all vehicle systems to power down.
10. Test for less than 2 Ω in each serial data circuits end to end between the K114B Hybrid/EV Powertrain Control Module 2 and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
11. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DTC U179D: LOST COMMUNICATION WITH BRAKE SYSTEM CONTROL MODULE 2 ON CHASSIS EXPANSION BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U179D

Lost Communication with Brake System Control Module 2 on Chassis Expansion Bus

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U179D	U179D	-	-
Ignition	U179D	U179D	-	-
Accessory Wake Up Serial Data 2	P06E4, U179D	U179D	-	-
Chassis High Speed GMLAN Serial Data (+)	U0077*	U179D, U0077*	U0077*	-
Chassis High Speed GMLAN Serial Data (-)	U0077*	U179D, U0077*	U0077*	-
Ground	-	U179D	-	-
* Other DTCs may set with this fault.				

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

- A driver information center message and/or a warning indicator may be displayed.
- The device is never signaled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify that DTC U0073, U0074, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data 2, and serial data circuit terminals.**

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K177 Brake Booster Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Ignition/Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**

    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K177 Brake Booster Control Module.
    - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K177 Brake Booster Control Module.
    - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the accessory wakeup serial data 2 circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the accessory wakeup serial data 2 circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data 2 circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
7. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 min for all vehicle systems to power down.
8. Test for less than 2 Ω in each Chassis high speed GMLAN serial data circuits end to end between the K177 Brake Booster Control Module and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
9. Replace the K177 Brake Booster Control Module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Serial Data Circuit Wiring Repairs

1. Scan Tool Does Not Communicate With Low Speed GMLAN Device 2. Scan Tool Does Not Communicate With High Speed GMLAN Device				

Circuit/System Description

The serial data circuit is the means by which the devices in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the Data Link Connector (DLC), the scan tool can be used to monitor each device for diagnostic purposes and to check for diagnostic trouble codes (DTC). When the vehicle is on, each device communicating on the serial data circuit sends a state of health message to ensure that the device is operating properly. When a device stops communicating on the serial data circuit, for example if the device loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other devices on the serial data circuit, which expect to receive that state of health message, detect its absence; those devices in turn set a DTC associated with the loss of state of health of the non communicating device. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored DTC.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

The device is never signaled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0073, U0074, U0077, U0078, U007A, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.

    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
7. Vehicle in Service Mode.
8. If equipped, verify a test lamp illuminates between the accessory wakeup serial data circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the harness connectors at the K9 Body Control Module.
    2. Test for infinite resistance between the accessory wakeup serial data circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
9. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 min for all vehicle systems to power down.
10. Test for less than 2 Ω in each serial data circuits end to end between the K114B Hybrid/EV Powertrain Control Module 2 and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
11. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DTC U1806: BATTERY ENERGY CONTROL MODULE HIGH VOLTAGE ENERGY MANAGEMENT CAN BUS OFF

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U1806

Battery Energy Control Module High Voltage Energy Management CAN Bus Off

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The high voltage energy management high speed GMLAN serial data circuits are serial data buses used to communicate information between the Hybrid Powertrain Control Module 2, the Battery Energy Control Module, and the Battery Charger. If this serial data system is inoperative the devices will not communicate with each other on this bus, but they still communicate with the scan tool through high speed GMLAN bus.

The scan tool does not communicate with devices through the high voltage energy management high speed GMLAN bus. The high voltage energy high speed GMLAN serial data circuits connect directly to the auxiliary data connector and do not connect with the scan tool.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 9 V.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the serial data circuits for more than 1.4 seconds without success.

Action Taken When the DTC Sets

The DTC U1806 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1806 is a type B DTC.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC U1806 is not set.
    - **If DTC U1806 is set**

      Refer to **DTC U007A**.

    - **If DTC U1806 is not set**
3. All OK

DTC U180B: BATTERY ENERGY CONTROL MODULE HIGH SPEED CAN BUS OFF

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U180B

Battery Energy Control Module High Speed CAN Bus Off

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The high speed GMLAN serial data circuits are serial data buses used to communicate information between the devices. The high speed GMLAN serial data circuits connect directly to the data link connector (DLC) for programming purposes.

This diagnostic is used to check the high speed GMLAN communication bus status.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 9 V.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the serial data circuits for more than 1.4 seconds without success.

Action Taken When the DTC Sets

The DTC U180B is a type B DTC.

Conditions for Clearing the DTC

The DTC U180B is a type B DTC.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC U180B is not set.
   - **If DTC U180B is set**

     Refer to Scan Tool Does Not Communicate with High Speed GMLAN Device .
   - **If DTC U180B is not set**
3. All OK

DTC U1814: POWERTRAIN WAKE-UP COMMUNICATION CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC U1814

Powertrain Wake-Up Communication Circuit

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	U1814 02*	U0100-U02FF	-	-
* Vehicle will not start.				

Circuit/System Description

The body control module activates the ignition circuit, when the ignition key is in ACC, ON or START. The ignition circuit wakes up the devices for serial data bus communication.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

The body control module senses a short to ground on the ignition circuit.

Action Taken When the DTC Sets

- The output command is turned off while the malfunction is present.

- The devices use a default value for the missing parameters until the next ignition cycle.
- The device(s) is never signaled. Therefore, the specific subsystem(s) will not function.
- The vehicle will not start while the circuit is shorted to ground.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Testing

NOTE: **Use the schematics to determine which devices are on the K9 body control module's ignition circuit terminal 22 X4. Use the connector end view to identify the ignition circuit terminal for each of those devices.**

1. Vehicle OFF, disconnect the harness connector at an easily accessible device that shares the K9 body control module's ignition circuit terminal 22 X4. Vehicle in Service Mode.
2. Verify that the DTC U1814 remains current.
   - **If the DTC becomes history**

     Replace the device that was just disconnected.

   - **If the DTC remains current**
3. With the prior devices disconnected, repeat steps 1 and 2 for each device on the ignition circuit except the K9 body control module.
4. Vehicle OFF, disconnect the X4 harness connector at the K9 body control module.
5. Test for infinite resistance between the ignition circuit terminal 22 X4 at the K9 body control module and ground.
   - **If less than infinite resistance**

     Repair the short to ground on the circuit.

   - **If infinite resistance**

6. Replace the K9 body control module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Powertrain High Speed GMLAN Serial Data (-)	U0074*	U0074, U1817*	U0074*	-
Ground	-	U1817*	-	-
* Other DTCs may set with this fault.				

Circuit/System Description

Devices connected to the powertrain high speed GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

The Motor Control Modules and the Hybrid Powertrain Control Module 1 are all internal to the Power Inverter Module. All circuits to the Hybrid Powertrain Control Module 1 are also internal to the Power Inverter Module and replaced as a single component.

Communication diagnostics for the serial data, including device power and ground as well as the wakeup circuits for Motor Control Modules and the Hybrid Powertrain Control Module 1 are all diagnosed from external sources only to the Power Inverter Module connector because any circuit fault condition within the Power Inverter Module will cause a complete replacement.

Conditions for Running the DTC

- The system voltage is more than 10 V.

- The vehicle power mode master requires serial data communication to occur from this specific device.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

DTC U1817 is a type A DTC.

Conditions for Clearing the DTC

DTC U1817 is a type A DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U-code.
- Do not replace a device reporting a U-code. The U-code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0293 is not set.
   - **If DTC U0293 is set**

     Refer to DTC U0100-U02FF.

   - **If DTC U0293 is not set**
3. Verify that DTC U0073, U0074, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

   - **If none of the DTCs are set**
4. Verify that DTCs U1818, U1821, and U182D are not set.
   - **If all of the DTCs are set together**

     Refer to DTC U0074.

   - **If all of the DTCs are not set together**
5. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data 2, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the X1 and X2 harness connectors at the T6 Power Inverter Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the T6 Power Inverter Module case and ground.
   - **If 10 Ω or greater**

     Check the ground connection and ground strap for the open/high resistance.

   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
     1. Vehicle OFF.
     2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the T6 Power Inverter Module.
    - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the T6 Power Inverter Module.
    - **If the test lamp illuminates**
7. Vehicle in Service Mode.
8. If equipped, verify a test lamp illuminates between the accessory wakeup serial data 2 circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the accessory wakeup serial data 2 circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data 2 circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
9. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 minutes for all vehicle systems to power down.
10. Test for less than 2 Ω in each of the powertrain high speed GMLAN serial data circuits end to end between the T6 Power Inverter Module and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
11. Replace the T6 Power Inverter Module.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC U1818: LOST COMMUNICATION WITH ENGINE CONTROL MODULE ON POWERTRAIN EXPANSION COMMUNICATION BUS

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC U1818

Lost Communication with Engine Control Module on Powertrain Expansion Communication Bus

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U1818	U1818	-	-
Ignition	U1818	U1818	-	-
Accessory Wake Up Serial Data 2	P06E4*	U1818	-	-
Powertrain High Speed GMLAN Serial Data (+)	U0074*	U1818, U0074*	U0074*	-
Powertrain High Speed GMLAN Serial Data (-)	U0074*	U1818, U0074*	U0074*	-
Ground	-	U1818	-	-
* Other DTCs may set with this fault.				

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

Conditions for Running the DTC

- The system voltage is at least 10 V.
- The vehicle power mode master requires serial data communication to occur from this specific device.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

DTC U1818 is a type A DTC.

Conditions for Clearing the DTC

DTC U1818 is a type A DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U-code.
- Do not replace a device reporting a U-code. The U-code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0100 is not set.
    - **If DTC U0100 is set**

      Refer to **DTC U0100-U02FF** .

    - **If DTC U0100 is not set**
3. Verify that DTC U0073, U0074, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
4. Verify that DTCs U1817, U1821, and U182D are not set.
    - **If all of the DTCs are set together**

      Refer to **DTC U0074** .

    - **If all of the DTCs are not set together**
5. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data 2, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the K20 Engine Control Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.

        - If infinite resistance, replace the K20 Engine Control Module.
    - **If the test lamp illuminates**

5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K20 Engine Control Module.
    - **If the test lamp illuminates**
7. Vehicle in Service Mode.
8. If equipped, verify a test lamp illuminates between the accessory wakeup serial data 2 circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the accessory wakeup serial data 2 circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data 2 circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
9. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 minutes for all vehicle systems to power down.
10. Test for less than 2 Ω in each of the powertrain high speed GMLAN serial data circuits end to end between the K20 Engine Control Module and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
11. Replace the K20 Engine Control Module.

DTC U182D: LOST COMMUNICATION WITH HYBRID POWERTRAIN CONTROL MODULE 2 ON POWERTRAIN EXPANSION COMMUNICATION BUS

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U182D

Lost Communication with Hybrid Powertrain Control Module 2 on Powertrain Expansion Communication Bus

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U182D	U182D	-	-
Ignition	U182D	U182D	-	-
Accessory Wake Up Serial Data	U1814	U182D	-	-
Powertrain High Speed GMLAN Serial Data (+)	U0074*	U182D, U0074	U0074*	-
Powertrain High Speed GMLAN Serial Data (-)	U0074*	U182D, U0074	U0074*	-
Ground	-	U182D	-	-
* Other DTCs may set with this fault.				

Circuit/System Description

The serial data circuit is the means by which the devices in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each device for diagnostic purposes and to check for diagnostic trouble codes (DTC). When the vehicle is on, each device communicating on the serial data circuit sends a state of health message to ensure that the device is operating properly. When a device stops communicating on the serial data circuit, for example if the device loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other devices on the serial data circuit, which expect to receive that state of health message, detect its absence; those devices in turn set a DTC associated with the loss of state of health of the non communicating device. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored DTC.

Conditions for Running the DTC

The system voltage is at least 11 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received for 10 seconds.

Action Taken When the DTC Sets

The DTC U182D is a type B DTC.

Conditions for Clearing the DTC

The DTC U182D is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:

  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U-code.
- Do not replace a device reporting a U-code. The U-code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0073, U0074, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If none of the DTCs are set**

3. Verify that DTCs U1817, U1818, and U1821 are not set.
    - **If all of the DTCs are set together**

      Refer to DTC U0074 .

    - **If all of the DTCs are not set together**
4. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data, and serial data circuit terminals.

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
7. Vehicle in Service Mode.

8. If equipped, verify a test lamp illuminates between the accessory wakeup serial data circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the harness connectors at the K9 Body Control Module.
    2. Test for infinite resistance between the accessory wakeup serial data circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
9. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 minutes for all vehicle systems to power down.
10. Test for less than 2 Ω in each powertrain high speed GMLAN serial data circuits end to end between the K114B Hybrid/EV Powertrain Control Module 2 and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
11. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

Conditions for Running the DTC

The system voltage is at least 10 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

- A driver information center message and/or a warning indicator may be displayed.
- The DTC U1833 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1833 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.

- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0121 or U0129 is not set.
    - **If any of the DTCs are set**

      Refer to **DTC U0100-U02FF** .
    - **If none of the DTCs are set**
3. Verify that DTC U0073, U0074, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .
    - **If none of the DTCs are set**
4. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data 2, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K17 Electronic Brake Control Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K17 Electronic Brake Control Module.
    - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K17 Electronic Brake Control Module.
    - **If the test lamp illuminates**
7. Vehicle in Service Mode.
8. If equipped, verify a test lamp illuminates between the accessory wakeup serial data 2 circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the accessory wakeup serial data 2 circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data 2 circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**

9. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 min for all vehicle systems to power down.
10. Test for less than 2 Ω in each Chassis high speed GMLAN serial data circuits end to end between the K17 Electronic Brake Control Module and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
11. Replace the K17 Electronic Brake Control Module.

Ground	-	U183E	-	-
* Scan Tool Does Not Communicate With Low Speed GMLAN Device				

Circuit/System Description

The serial data circuit is the means by which the devices in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the Data Link Connector (DLC), the scan tool can be used to monitor each device for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the vehicle is ON, each device communicating on the serial data circuit sends a state of health message to ensure that the device is operating properly. When a device stops communicating on the serial data circuit, for example if the device loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other devices on the serial data circuit, which expect to receive that state of health message, detect its absence; those devices in turn set a DTC associated with the loss of state of health of the non communicating device. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored DTC.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

The device is never signaled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

* Scan Tool Does Not Communicate With Low Speed GMLAN Device				

Circuit/System Description

The serial data circuit is the means by which the devices in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each device for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the vehicle is ON, each device communicating on the serial data circuit sends a state of health message to ensure that the device is operating properly. When a device stops communicating on the serial data circuit, for example if the device loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other devices on the serial data circuit, which expect to receive that state of health message, detect its absence; those devices in turn set a DTC associated with the loss of state of health of the non communicating device. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored DTC.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

The device is never signaled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U-code.
- Do not replace a device reporting a U-code. The U-code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0164 is not set.
   - **If DTC U0164 is set**

     Refer to **DTC U0100-U02FF** .

   - **If DTC U0164 is not set**
3. Verify that DTC U0073, U0078, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
4. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the K33 HVAC Control Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**
  1. Vehicle OFF.
  2. Test for infinite resistance between the B+ circuit and ground.
     - If less than infinite resistance, repair the short to ground on the circuit.
     - If infinite resistance, replace the K33 HVAC Control Module.
- **If the test lamp illuminates**

5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
     1. Vehicle OFF.
     2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
     1. Vehicle OFF.
     2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K33 HVAC Control Module.
   - **If the test lamp illuminates**
7. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 minutes for all vehicle systems to power down.
8. Test for less than 2 Ω in the low speed GMLAN serial data circuits end to end between the K33 HVAC Control Module and the device setting the DTC.
   - **If 2 Ω or greater**

     Repair the open/high resistance in the serial data circuit.

   - **If less than 2 Ω**
9. Replace the K33 HVAC Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC U184C: LOST COMMUNICATION WITH INSTRUMENT CLUSTER ON LOW SPEED CAN BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U184C

Lost Communication with Instrument Cluster on Low Speed CAN Bus

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U184C	U184C	-	-
Ignition	U184C	U184C	-	-
Low Speed GMLAN Serial Data	U0078*	U0078, U184C	U0078*	-
Ground	-	U184C	-	-
* Scan Tool Does Not Communicate With Low Speed GMLAN Device				

Circuit/System Description

The serial data circuit is the means by which the devices in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each device for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the vehicle is ON, each device communicating on the serial data circuit sends a state of health message to ensure that the device is operating properly. When a device stops communicating on the serial data circuit, for example if the device loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other devices on the serial data circuit, which expect to receive that state of health message, detect its absence; those devices in turn set a DTC associated with the loss of state of health of the non communicating device. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored DTC.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

The device is never signaled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U-code.

- Do not replace a device reporting a U-code. The U-code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0155 is not set.
    - **If DTC U0155 is set**

      Refer to **DTC U0100-U02FF** .

    - **If DTC U0155 is not set**
3. Verify that DTC U0073, U0078, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
4. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the P16 Instrument Cluster. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the P16 Instrument Cluster.
    - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the P16 Instrument Cluster.
    - **If the test lamp illuminates**
7. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 minutes for all vehicle systems to power down.
8. Test for less than 2 Ω in the low speed GMLAN serial data circuits end to end between the P16 Instrument Cluster and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
9. Replace the P16 Instrument Cluster.

Circuit/System Description

The serial data circuit is the means by which the devices in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each device for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the vehicle is ON, each device communicating on the serial data circuit sends a state of health message to ensure that the device is operating properly. When a device stops communicating on the serial data circuit, for example if the device loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other devices on the serial data circuit, which expect to receive that state of health message, detect its absence; those devices in turn set a DTC associated with the loss of state of health of the non communicating device. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored DTC.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

The device is never signaled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U-code.
- Do not replace a device reporting a U-code. The U-code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

   - **If any of the DTCs are set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .
   - **If none of the DTCs are set**
4. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the A11 Radio. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the A11 Radio.
   - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the ignition circuit and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the A11 Radio.
    - **If the test lamp illuminates**
7. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 minutes for all vehicle systems to power down.
8. Test for less than 2 Ω in the low speed GMLAN serial data circuits end to end between the A11 Radio and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
9. Replace the A11 Radio.

* Scan Tool Does Not Communicate With Low Speed GMLAN Device				

Circuit/System Description

The serial data circuit is the means by which the devices in the vehicle communicate with each other. Once the scan tool is connected to the serial data circuit through the data link connector (DLC), the scan tool can be used to monitor each device for diagnostic purposes and to check for diagnostic trouble codes (DTCs). When the vehicle is ON, each device communicating on the serial data circuit sends a state of health message to ensure that the device is operating properly. When a device stops communicating on the serial data circuit, for example if the device loses power or ground, the state of health message it normally sends on the serial data circuit disappears. Other devices on the serial data circuit, which expect to receive that state of health message, detect its absence; those devices in turn set a DTC associated with the loss of state of health of the non communicating device. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored DTC.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

The device is never signaled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U-code.
- Do not replace a device reporting a U-code. The U-code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0151 is not set.
    - **If DTC U0151 is set**

      Refer to DTC U0100-U02FF .
    - **If DTC U0151 is not set**
3. Verify that DTC U0073, U0078, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle .
    - **If none of the DTCs are set**
4. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: Use the schematics and connector end views to identify the device's ground, B+, ignition, and serial data circuit terminals.

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the K36 Inflatable Restraint Sensing and Diagnostic Module. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

    - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
  - **If the test lamp does not illuminate and the circuit fuse is open**
  1. Vehicle OFF.
  2. Test for infinite resistance between the B+ circuit and ground.
     - If less than infinite resistance, repair the short to ground on the circuit.
     - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
  - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K36 Inflatable Restraint Sensing and Diagnostic Module.
   - **If the test lamp illuminates**
7. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 minutes for all vehicle systems to power down.
8. Test for less than 2 Ω in the low speed GMLAN serial data circuits end to end between the K36 Inflatable Restraint Sensing and Diagnostic Module and the device setting the DTC.
   - **If 2 Ω or greater**

     Repair the open/high resistance in the serial data circuit.

   - **If less than 2 Ω**
9. Replace the K36 Inflatable Restraint Sensing and Diagnostic Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

* Multiple DTCs may be set and multiple symptoms including a no start condition may occur.				

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

Conditions for Running the DTC

The system voltage is more than 10 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received for more than 500 ms.

Action Taken When the DTC Sets

DTC U185A is a type A DTC.

Conditions for Clearing the DTC

DTC U185A is a type A DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.

    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

4. Refer to Circuit/System Testing.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data 2, high voltage energy management communication enable, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the X357 and X358 harness connectors at the A4 Hybrid/EV Battery Pack.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**

   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K16 Battery Energy Control Module.
   - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K16 Battery Energy Control Module.
   - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the accessory wakeup serial data 2 circuit terminal and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the accessory wakeup serial data 2 circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the accessory wakeup serial data 2 circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp illuminates**
7. If equipped, verify a test lamp illuminates between the high voltage energy management communication enable circuit terminal and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, disconnect the X2 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the high voltage energy management communication enable circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the high voltage energy management communication enable circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp illuminates**
8. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the

harness connectors at the device setting the DTC.

9. Test for less than 2 Ω in each high voltage energy management high speed GMLAN serial data circuits end to end between the A4 Hybrid/EV Battery Pack and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
10. Vehicle OFF, reconnect the X357 and X358 harness connectors at the A4 Hybrid/EV Battery Pack.
11. Perform the High Voltage Disabling procedure before proceeding with this diagnostic. Refer to **High Voltage Disabling** .
12. Reconnect the 12 V battery.
13. Vehicle OFF, connect the EL-52014 low voltage test harness.
14. Disconnect the X8 harness connector at the K16 Battery Energy Control Module.
15. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**

      Repair the open/high resistance in the circuit.

    - **If less than 10 Ω**
16. Vehicle in Service Mode.
17. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate**

      Repair the short to ground or the open/high resistance in the circuit.

    - **If the test lamp illuminates**
18. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate**

      Repair the short to ground or the open/high resistance in the circuit.

    - **If the test lamp illuminates**
19. If equipped, verify a test lamp illuminates between the accessory wakeup serial data 2 circuit terminal and ground.
    - **If the test lamp does not illuminate**

      Repair the short to ground or the open/high resistance in the circuit.

    - **If the test lamp illuminates**
20. If equipped, verify a test lamp illuminates between the high voltage energy management communication enable circuit terminal and ground.
    - **If the test lamp does not illuminate**

      Repair the short to ground or the open/high resistance in the circuit.

    - **If the test lamp illuminates**
21. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the X357 harness connector at the A4 Hybrid/EV Battery Pack.
22. Test for less than 2 Ω in each high voltage energy management high speed GMLAN serial data circuits end to end between the K16 Battery Energy Control Module and the A4 Hybrid/EV Battery Pack.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the circuit.

- **If less than 2 Ω**

23. Replace the K16 Battery Energy Control Module.

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

This diagnostic is used to check the loss of communication with the Hybrid/EV Powertrain Control Module 2 on high voltage energy management high speed GMLAN bus. The Battery Energy Control Module supervises a periodic serial data message to check the communication status of the Hybrid/EV Powertrain Control Module 2. If this message is not received within 1 s, this DTC is set.

Conditions for Running the DTC

- The device is awake and communicating.

- The system voltage is at least 9 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received within 1 s.

Action Taken When the DTC Sets

- No Cell Balancing function. However, cell balancing switch diagnostics still run.
- DTC U185B is a type B DTC.

Conditions for Clearing the DTC

DTC U185B is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

circuit terminals.

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the accessory wakeup serial data circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the harness connectors at the K9 Body Control Module.
    2. Test for infinite resistance between the accessory wakeup serial data circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
7. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the

X357 harness connector at the A4 Hybrid/EV Battery Pack.

8. Test for less than 2 Ω in each high voltage energy management high speed GMLAN serial data circuits end to end between the K114B Hybrid/EV Powertrain Control Module 2 and the A4 Hybrid/EV Battery Pack.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.
    - **If less than 2 Ω**
9. Vehicle OFF, disable the high voltage system. Refer to **High Voltage Disabling** .
10. Reconnect the 12 V battery.
11. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the X8 harness connector at the K16 Battery Energy Control Module.
12. Test for less than 2 Ω in each high voltage energy management high speed GMLAN serial data circuits end to end between the A4 Hybrid/EV Battery Pack and the K16 Battery Energy Control Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.
    - **If less than 2 Ω**
13. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

Conditions for Running the DTC

The system voltage is greater than 10.25 V.

Conditions for Setting the DTC

The A/C Compressor is not able to receive the serial data message from the Hybrid Powertrain Control Module 2 for 3 seconds.

Action Taken When the DTC Sets

The DTC U1860 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1860 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U-code.
- Do not replace a device reporting a U-code. The U-code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.

- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0073, U0074, U0078, U007A, U1814, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

   - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.

4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp illuminates**
7. Vehicle in Service Mode.
8. If equipped, verify a test lamp illuminates between the accessory wakeup serial data circuit terminal and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, disconnect the harness connectors at the K9 Body Control Module.
   2. Test for infinite resistance between the accessory wakeup serial data circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the accessory wakeup serial data circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
9. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the X1 harness connector at the G1 A/C Compressor. It may take up to 2 minutes for all vehicle systems to power down.
10. Test for less than 2 Ω in each serial data circuits end to end between the K114B Hybrid/EV Powertrain Control Module 2 and the G1 A/C Compressor.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
11. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DTC U1885: BATTERY ENERGY CONTROL MODULE LOST COMMUNICATION WITH HYBRID/EV POWERTRAIN CONTROL MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U1885

Battery Energy Control Module Lost Communication with Hybrid/EV Powertrain Control Module

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U1885*	U1885	-	-
Ignition	U1885*	U1885*	-	-
Accessory Wake Up Serial Data 2	P06E4, U1885*	U1885*	-	-
High Speed GMLAN Serial Data (+)	U0073*	U0073, U1885*	U0073*	-
High Speed GMLAN Serial Data (-)	U0073*	U0073, U1885*	U0073*	-
Ground	-	U1885*	-	-
* Other DTCs may set with this fault and multiple symptoms including a no start condition may occur.				

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

This diagnostic is used to check the loss of communication with Hybrid/EV Powertrain Control Module 1 on high speed GMLAN bus. The Battery Energy Control Module supervises a periodic serial data message to check the communication status of the Hybrid/EV Powertrain Control Module 1. If this message is not received within 3 s, then this DTC is set.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 9 V.
- The DTC U180B is not set.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received within 3 s.

Action Taken When the DTC Sets

The DTC U1885 is a type B DTC.

Conditions for Clearing the DTC

The DTC U1885 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0293 is not set.
   - **If DTC U0293 is set**

     Refer to DTC U0100-U02FF .

   - **If DTC U0293 is not set**
3. Verify that DTC U0073, U0074, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

     Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

   - **If none of the DTCs are set**
4. Refer to Circuit/System Testing.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data 2, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the X1 harness connector at the T6 Power Inverter Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal (or T6 Power Inverter Module case) and ground.
    - **If 10 Ω or greater**

      Check the ground connection and ground strap for the open/high resistance.

    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the T6 Power Inverter Module.
    - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the T6 Power Inverter Module.
    - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the accessory wakeup serial data 2 circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the accessory wakeup serial data 2 circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data 2 circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
7. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the X357 and X358 harness connectors at the A4 Hybrid/EV Battery Pack. It may take up to 2 min for all vehicle systems to power down.

8. Test for less than 2 Ω in each high speed GMLAN serial data circuits end to end between the T6 Power Inverter Module and the A4 Hybrid/EV Battery Pack.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
9. Vehicle OFF, disable the high voltage system. Refer to **High Voltage Disabling** .
10. Reconnect the 12 V battery.
11. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the X8 harness connector at the K16 Battery Energy Control Module. It may take up to 2 min for all vehicle systems to power down.
12. Test for less than 2 Ω in each high speed GMLAN serial data circuits end to end between the A4 Hybrid/EV Battery Pack and the K16 Battery Energy Control Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
13. Replace the T6 Power Inverter Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DTC U18A4: LOST COMMUNICATION WITH HYBRID/EV BATTERY DC CHARGING COMMUNICATIONS GATEWAY MODULE ON HIGH VOLTAGE ENERGY MANAGEMENT CAN BUS

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U18A4

Lost Communication with Hybrid/EV Battery DC Charging Communications Gateway Module on High Voltage Energy Management CAN Bus

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

Conditions for Running the DTC

- The system voltage is more than 10.2 V.
- The High Voltage Energy Management bus communication is enabled for more than 2 s.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received for more than 500 ms.

Action Taken When the DTC Sets

DTC U18A4 is a type B DTC.

Conditions for Clearing the DTC

DTC U18A4 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U-code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U-code.
- Do not replace a device reporting a U-code. The U-code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.

- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC U0073, U0074, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, serial data communication enable, high voltage energy management communication enable, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the low voltage harness connectors at the T24 Battery Charger - DC.
2. Test for less than 10 Ω between each ground circuit terminal and ground.

- **If 10 Ω or greater**
  1. Vehicle OFF.
  2. Test for less than 2 Ω in the ground circuit end to end.
     - If 2 Ω or greater, repair the open/high resistance in the circuit.
     - If less than 2 Ω, repair the open/high resistance in the ground connection.
- **If less than 10 Ω**

3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
     1. Vehicle OFF.
     2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
     1. Vehicle OFF.
     2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the T24 Battery Charger - DC.
   - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
     1. Vehicle OFF.
     2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
     1. Vehicle OFF.
     2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the T24 Battery Charger - DC.
   - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the serial data communication enable circuit terminal and ground.
   - **If the test lamp does not illuminate**
     1. Vehicle OFF, disconnect the harness connectors at the K9 Body Control Module.
     2. Test for infinite resistance between the serial data communication enable circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
     3. Test for less than 2 Ω in the serial data communication enable circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
7. If equipped, verify a test lamp illuminates between the high voltage energy management communication enable circuit terminal and ground.
   - **If the test lamp does not illuminate**
     1. Vehicle OFF, disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2.
     2. Test for infinite resistance between the high voltage energy management communication enable circuit and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the high voltage energy management communication enable circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**

8. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the harness connectors at the device setting the DTC.
9. Test for less than 2 Ω in each high voltage energy management serial data circuits end to end between the T24 Battery Charger - DC and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
10. Replace the T24 Battery Charger - DC.

DTC U18A6: LOST COMMUNICATION WITH RIGHT OBJECT DETECTION CONTROL MODULE ON DEDICATED BUS 1

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U18A6

Lost Communication with Right Object Detection Control Module on Dedicated Bus 1

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U18A6	U18A6	-	-
Communication Enable	U18A6	U18A6	-	-
Serial Data (+)	U18A6	U18A6	U18A6	-
Serial Data (-)	U18A6	U18A6	U18A6	-
Ground	-	U18A6	-	-

Circuit/System Description

The side object sensor modules use radar to determine the presence of objects nearby. The left side object sensor is the master that communicates on serial data. There is a private communication network between the left and right sensors. The scan tool can communicate only with the left sensor. Side blind zone alert is active when the vehicle is out of park or the parking brake is off on manual transmission vehicles. If a vehicle is detected in the side blind zone, the warning symbols will illuminate on the appropriate side. The warning symbols will vary brightness based on the ambient light conditions. When an object is detected in the left side blind zone, the side object sensor module sends a message to the right sensor through serial data. The right sensor then supplies voltage to illuminate the visual indicator on the left side outside rear view mirror. When an object is detected in the right side blind zone, the right side object sensor will supply a voltage to illuminate the visual indicator on the right side outside rear view mirror.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 40, without a repeat of the malfunction.

Circuit/System Verification

1. Verify that DTC U0073, U0075, U0078, U007B, U007C, U007D, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
2. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, and serial data circuit terminals.**

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connector at the B218R Side Object Sensor Module - Right. It may take up to 10 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
   - **If 10 Ω or greater**
   1. Ignition/Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON/Vehicle In Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the B218R Side Object Sensor Module - Right.
   - **If the test lamp illuminates**
5. If equipped, test for at least 6 V between the communication enable circuit terminal and ground.
   - **If less than 6 V**
   1. Ignition/Vehicle OFF, disconnect the harness connectors at the B218L Side Object Sensor Module - Left.
   2. Test for infinite resistance between the communication enable circuit terminal and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the communication enable circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the B218L Side Object Sensor Module - Left.
   - **If 6 V or greater**
6. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connector at the B218L Side Object Sensor Module - Left. It may take up to 10 min for all vehicle systems to power down.
7. Test for less than 1 V between each serial data circuits and ground.
   - **If 1 V or greater**

     Repair the short to voltage in the serial data circuit.

   - **If less than 1 V**
8. Test for infinite resistance between each serial data circuits and ground.
   - **If less than infinite resistance**

     Repair the short to ground in the serial data circuit.

   - **If infinite resistance**

9. Test for infinite resistance between 2 serial data circuits.
    - **If less than infinite resistance**

      Repair the short together between the serial data circuits.

    - **If infinite resistance**
10. Test for less than 2 Ω in each of the serial data circuits end to end between the B218L Side Object Sensor Module - Left and the B218R Side Object Sensor Module - Right.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**

NOTE: **Prior to replacing a module, visually inspect wiring connections to both Side Object Sensor Modules for contamination, deformation, terminal fretting corrosion, terminal tension, and chafing.**

11. Replace the B218R Side Object Sensor Module - Right.

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

The device is never signaled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC U0073, U0074, U0077, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle .
    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wakeup serial data, and serial data circuit terminals.**

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the harness connectors at the K173 Transmission Range Control Module.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K173 Transmission Range Control Module.
   - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K173 Transmission Range Control Module.
   - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the accessory wakeup serial data circuit terminal and ground.
   - **If the test lamp does not illuminate**
   1. Ignition OFF, remove the test lamp, disconnect the harness connectors at the K9 Body Control Module.
   2. Test for infinite resistance between the accessory wakeup serial data circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the accessory wakeup serial data circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
7. Test for less than 4.5 V between each chassis high speed GMLAN serial data circuit terminal and ground.
   - **If 4.5 V or greater**

     Refer to DTC U0077 to test for a short to voltage.

   - **If less than 4.5 V**
8. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
9. Test for greater than 100 Ω between each chassis high speed GMLAN serial data circuit terminal and ground.
   - **If 100 Ω or less**

     Refer to DTC U0077 to test for a short to ground.

   - **If greater than 100 Ω**
10. Disconnect the harness connectors at the device setting the DTC.
11. Test for less than 2 Ω in each chassis high speed GMLAN serial data circuits end to end between the K173 Transmission Range Control Module and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

- **If less than 2 Ω**

12. Replace the K173 Transmission Range Control Module.

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073, U0074, U0075, U0077, U0078, U007A, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wakeup serial data, and serial data circuit terminals.**

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the harness connectors at the K20 Engine Control Module.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
   - **If 10 Ω or greater**
   1. Ignition/Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON/Vehicle In Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K20 Engine Control Module.
   - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.

    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K20 Engine Control Module.
    - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the accessory wakeup serial data circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the K9 Body Control Module.
    2. Test for infinite resistance between the accessory wakeup serial data circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
7. Test for less than 4.5 V between each high speed GMLAN serial data circuit terminal and ground.
    - **If 4.5 V or greater**

      Refer to Scan Tool Does Not Communicate with High Speed GMLAN Device to test for a short to voltage.

    - **If less than 4.5 V**
8. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
9. Test for greater than 100 Ω between each high speed GMLAN serial data circuit terminal and ground.
    - **If 100 Ω or less**

      Refer to Scan Tool Does Not Communicate with High Speed GMLAN Device to test for a short to ground.

    - **If greater than 100 Ω**
10. Disconnect the harness connectors at the K173 Transmission Range Control Module.
11. Test for less than 2 Ω in each high speed GMLAN serial data circuits end to end between the K20 Engine Control Module and the K173 Transmission Range Control Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
12. Replace the K20 Engine Control Module.

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073, U0074, U0075, U0077, U0078, U007A, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wakeup serial data, and serial data circuit terminals.**

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the harness connectors at the K38 Chassis Control Module.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Ignition/Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON/Vehicle In Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K38 Chassis Control Module.
    - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K38 Chassis Control Module.
    - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the accessory wakeup serial data circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the K9 Body Control Module.
    2. Test for infinite resistance between the accessory wakeup serial data circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

    - If less than 2 Ω, replace the K9 Body Control Module.
  - **If the test lamp illuminates**

7. Test for less than 4.5 V between each high speed GMLAN serial data circuit terminal and ground.
   - **If 4.5 V or greater**

     Refer to Scan Tool Does Not Communicate with High Speed GMLAN Device to test for a short to voltage.

   - **If less than 4.5 V**
8. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
9. Test for greater than 100 Ω between each high speed GMLAN serial data circuit terminal and ground.
   - **If 100 Ω or less**

     Refer to Scan Tool Does Not Communicate with High Speed GMLAN Device to test for a short to ground.

   - **If greater than 100 Ω**
10. Disconnect the harness connectors at the K173 Transmission Range Control Module.
11. Test for less than 2 Ω in each high speed GMLAN serial data circuits end to end between the K38 Chassis Control Module and the K173 Transmission Range Control Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
12. Replace the K38 Chassis Control Module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Serial Data Circuit Wiring Repairs
- Control Module References for device replacement, programming and setup

DTC U18AC: TRANSMISSION RANGE CONTROL MODULE LOST COMMUNICATION WITH CHASSIS CONTROL MODULE ON CHASSIS EXPANSION CAN BUS

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC U18AC

Transmission Range Control Module Lost Communication with Chassis Control Module on Chassis Expansion CAN Bus

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U18AC	U18AC	-	-
Ignition	U18AC	U18AC	-	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Accessory Wakeup Serial Data	U1814, U2099	U18AC	-	-
Chassis High Speed GMLAN Serial Data (+)	U0077*	U0077, U18AC*	U0077*	-
Chassis High Speed GMLAN Serial Data (-)	U0077*	U0077, U18AC*	U0077*	-
Ground	-	U18AC	-	-
* Other DTCs may set with this fault.				

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

The device is never signaled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.

- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Ignition ON.
2. Verify that DTC U0073, U0074, U0077, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wakeup serial data, and serial data circuit terminals.**

1. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the harness connectors at the K38 Chassis Control Module.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Ignition OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, repair the open/high resistance in the ground connection.
- **If less than 10 Ω**

3. Ignition ON.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K38 Chassis Control Module.
   - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K38 Chassis Control Module.
   - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the accessory wakeup serial data circuit terminal and ground.
   - **If the test lamp does not illuminate**
   1. Ignition OFF, remove the test lamp, disconnect the harness connectors at the K9 Body Control Module.
   2. Test for infinite resistance between the accessory wakeup serial data circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the accessory wakeup serial data circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
7. Test for less than 4.5 V between each chassis high speed GMLAN serial data circuit terminal and ground.
   - **If 4.5 V or greater**

     Refer to DTC U0077 to test for a short to voltage.

   - **If less than 4.5 V**
8. Ignition OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
9. Test for greater than 100 Ω between each chassis high speed GMLAN serial data circuit terminal and ground.

- **If 100 Ω or less**

  Refer to DTC U0077 to test for a short to ground.

- **If greater than 100 Ω**

10. Disconnect the harness connectors at the K173 Transmission Range Control Module.
11. Test for less than 2 Ω in each chassis high speed GMLAN serial data circuits end to end between the K38 Chassis Control Module and the K173 Transmission Range Control Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
12. Replace the K38 Chassis Control Module.

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073, U0074, U0075, U0077, U0078, U007A, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, serial data communication enable, and serial data circuit terminals.**

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the harness connectors at the K17 Electronic Brake Control Module.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Ignition/Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON/Vehicle In Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.

        - If infinite resistance, replace the K17 Electronic Brake Control Module.
    - **If the test lamp illuminates**

5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K17 Electronic Brake Control Module.
    - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the serial data communication enable circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the K9 Body Control Module.
    2. Test for infinite resistance between the serial data communication enable circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the serial data communication enable circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
7. Test for less than 4.5 V between each chassis high speed GMLAN serial data circuit terminal and ground.
    - **If 4.5 V or greater**

      Refer to DTC U0077 to test for a short to voltage.

    - **If less than 4.5 V**
8. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
9. Test for greater than 100 Ω between each chassis high speed GMLAN serial data circuit terminal and ground.
    - **If 100 Ω or less**

      Refer to DTC U0077 to test for a short to ground.

    - **If greater than 100 Ω**
10. Disconnect the harness connectors at the K173 Transmission Range Control Module.
11. Test for less than 2 Ω in each chassis high speed GMLAN serial data circuits end to end between the K17 Electronic Brake Control Module and the K173 Transmission Range Control Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
12. Replace the K17 Electronic Brake Control Module.

Circuit/System Description

At the core of the infotainment system is the Radio Ethernet Audio Video Bridging switch which communicates directly to each contributing Infotainment control module terminator. The Ethernet harness consists of twisted pair wires from point to point. Each control module on the Ethernet infotainment system sends/receives data at 100 Mbit/s to/from a specified port at the Radio. The Radio

Ethernet will also be used to program USB software update files to the control modules connected to the Ethernet ports.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

The device is never signaled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073, U0078, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to Diagnostic Trouble Code (DTC) List - Vehicle .

    - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the control module's ground, B+, ignition, and serial data circuit terminals.**

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the control module specified by the DTC descriptor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Ignition/Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Ignition ON/Vehicle In Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the control module specified by the DTC descriptor.
    - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the control module specified by the DTC descriptor.
    - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
    - **If the test lamp does not illuminate**
    1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the control module that controls the ignition circuit.
    - **If the test lamp illuminates**
7. Ignition/Vehicle OFF, disconnect the harness connectors at the device setting the DTC.
8. Ignition ON/Vehicle In Service Mode.

9. Test for less than 4.5 V between each Ethernet serial data circuit terminal and ground.
    - **If 4.5 V or greater**

      Repair the short to voltage in the serial data circuit.

    - **If less than 4.5 V**
10. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
11. Test for infinite resistance between each Ethernet serial data circuit terminal and ground.
    - **If less than infinite resistance**

      Repair the short to ground in the serial data circuit.

    - **If infinite resistance**
12. Test for infinite resistance between each pair of Ethernet serial data circuit terminals.
    - **If less than infinite resistance**

      Repair the short together in the serial data circuits.

    - **If infinite resistance**
13. Test for less than 2 Ω in each Ethernet serial data circuit end to end.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
14. Replace the control module specified by the DTC descriptor.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Serial Data Circuit Wiring Repairs
- Control Module References for device replacement, programming and setup

DTC U18B5: LOST COMMUNICATION WITH HYBRID POWERTRAIN CONTROL MODULE ON CHASSIS EXPANSION CAN BUS

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC U18B5

Lost Communication With Hybrid Powertrain Control Module on Chassis Expansion CAN Bus

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	U18B5	U18B5	-	-
Ignition	U18B5	U18B5	-	-
Accessory Wake Up Serial Data 2	P06E4, U1817*	U18B5	-	-

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Chassis High Speed GMLAN Serial Data (+)	U0077*	U0077, U18B5*	U0077*	-
Chassis High Speed GMLAN Serial Data (-)	U0077*	U0077, U18B5*	U0077*	-
Ground	-	U18B5	-	-
* Other DTCs may set with this fault.				

Circuit/System Description

Devices connected to the Chassis high speed GMLAN serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

The Motor Control Modules and the Hybrid Powertrain Control Module 1 are all internal to the Power Inverter Module. Communication diagnostics for the serial data, including device power and ground as well as the wakeup circuits for Motor Control Modules and the Hybrid Powertrain Control Module 1 are all diagnosed from external sources only to the Power Inverter Module connector because any circuit fault condition within the Power Inverter Module will cause a complete replacement.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

The device is never signaled. Therefore, the specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.

- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

Circuit/System Verification

1. Ignition ON/Vehicle in Service Mode.
2. Verify that DTC U0293 is not set.
    - **If DTC U0293 is set**

      Refer to **DTC U0100-U02FF** .

    - **If DTC U0293 is not set**
3. Verify that DTC U0073, U0074, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
4. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data 2, and serial data circuit terminals.**

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the X1 and X2 harness connectors at the T6 Power Inverter Module. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal (or module case) and ground.
   - **If 10 Ω or greater**
   1. Ignition/Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the ground circuit or ground strap.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Ignition ON/Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the T6 Power Inverter Module.
   - **If the test lamp illuminates**
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the T6 Power Inverter Module.
   - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between the accessory wakeup serial data 2 circuit terminal and ground.
   - **If the test lamp does not illuminate**
   1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the accessory wakeup serial data 2 circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the accessory wakeup serial data 2 circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.

    - **If the test lamp illuminates**
7. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the device setting the DTC. It may take up to 2 min for all vehicle systems to power down.
8. Test for less than 2 Ω in each of the Chassis high speed GMLAN serial data circuits end to end between the T6 Power Inverter Module and the device setting the DTC.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
9. Replace the T6 Power Inverter Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DTC U18B9-U18BF: PRIMARY/SECONDARY HIGH SPEED CAN BUS SUBNET CONFIGURATION LIST

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U18B9

Primary High Speed CAN Bus Subnet Configuration List

DTC U18BF

Secondary High Speed CAN Bus Subnet Configuration List

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The devices on the high speed GMLAN serial data bus and the chassis high speed GMLAN serial data bus must be programmed with software that specifically identifies the correct type and quantity of devices on the bus based on RPO configuration. If a device was not properly configured after installation, the appropriate U Code may be set for that device. No external circuit diagnosis is involved.

Conditions for Running the DTC

- Voltage supplied to the device is in the normal operating voltage range.
- The vehicle power mode requires serial data communication to occur.

Conditions for Setting the DTC

- The device is not configured properly.
- The device recognises a programming error.
- CAN-Bus configuration is invalid

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.

- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC U18B9-U18BF is not set.
    - **If DTC U18B9-U18BF is set along with other DTCs set**

      Diagnose all other DTCs first. Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If DTC U18B9-U18BF is set without other DTCs set**
    1. Program the device that set the DTC.
    2. Vehicle OFF, remove the scan tool, open and close the driver door. Wait 60 seconds. Vehicle in Service Mode.
    3. Verify the DTC does not set.
        - If the DTC sets, replace the appropriate device.
        - If the DTC does not set
    4. All OK.
    - **If DTC U0400-U05FF is not set**
3. All OK

DTC U2099: HIGH SPEED COMMUNICATION ENABLE CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.

- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U2099

High Speed Communication Enable Circuit

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Ignition	U2099 02*	U0100-U02FF	U0100-U02FF	-
* Vehicle will not start.				

Circuit/System Description

The body control module activates the ignition circuit, when the ignition key is in ACC, ON or START. The ignition circuit wakes up the devices for serial data bus communication.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The vehicle power mode master requires serial data communication to occur.

Conditions for Setting the DTC

The body control module senses a short to ground on the ignition circuit.

Action Taken When the DTC Sets

- The output command is turned off while the malfunction is present.
- The devices use a default value for the missing parameters until the next ignition cycle.
- The device(s) is never signaled. Therefore, the specific subsystem(s) will not function.
- The vehicle will not start while the circuit is shorted to ground.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Circuit/System Testing

NOTE: **Use the schematics to determine which devices are on the K9 body control module's ignition circuit terminal 23 X4. Use the connector end view to identify the ignition circuit terminal for each of those devices.**

1. Vehicle OFF, disconnect the harness connector at an easily accessible device that shares the K9 body control module's ignition circuit terminal 23 X4. Vehicle in Service Mode.
2. Verify that the DTC U2099 remains current.
    - **If the DTC becomes history**

      Replace the device that was just disconnected.
    - **If the DTC remains current**
3. With the prior devices disconnected, repeat steps 1 and 2 for each device on the ignition circuit except the K9 body control module.
4. Vehicle OFF, disconnect the X4 harness connector at the K9 body control module.
5. Test for infinite resistance between the ignition circuit terminal 23 X4 at the K9 body control module and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the circuit.
    - **If infinite resistance**
6. Replace the K9 body control module.

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device. A loss of serial data communications DTC does not represent a failure of the devices that contain the stored code.

Conditions for Running the DTC

The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

Specific subsystems will not function.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.

  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.
- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.
- This diagnostic procedure can be used to diagnose the common no communication DTCs: U216A, U216B, and other DTCs within U2160 - U2231 range.

Control Module References for scan tool information

Circuit/System Verification

1. Determine the device that is not communicating. Refer to **Control Module U Code List** .
2. Vehicle in Service Mode.
3. Verify that DTC U0073, U0074, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
4. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data 2, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect all the harness connectors at the device that is not communicating.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
7. Vehicle in Service Mode.
8. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance

3. Test for less than 2 Ω in the ignition circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
    - If less than 2 Ω, replace the control module that controls the ignition circuit.
- **If the test lamp illuminates**

NOTE: **This test step is only applicable to a low speed GMLAN device.**

9. Test for less than 4.5 V between each low speed GMLAN serial data circuit terminal and ground.
    - **If 4.5 V or greater**

      Refer to Scan Tool Does Not Communicate with Low Speed GMLAN Device to test for a short to voltage in the serial data circuit.

    - **If less than 4.5 V**
10. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
11. Test for less than 2 Ω in each of the serial data circuits end to end between the device harness connector and the appropriate X84 Data Link Connector terminals listed below.
    - Low speed GMLAN serial data circuit terminal 1
    - High speed GMLAN serial data circuit terminal 6 or 14
    - Chassis high speed GMLAN serial data circuit terminal 12 or 13
    - Object high speed GMLAN serial data circuit terminal 3 or 11
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit between the non communicating device and the device setting the DTC or a serial data splice pack.

    - **If less than 2 Ω**

NOTE: **The following test step is only applicable to a high speed GMLAN device with 2 pairs of serial data circuits or a high speed GMLAN device with an internal terminating resistor.**

12. Test for 110 - 130 Ω between each pair of high speed GMLAN serial data circuits.
    - **If less than 110 Ω**

      Refer to Scan Tool Does Not Communicate with High Speed GMLAN Device to test for a short to ground or a short between the serial data circuits.

    - **If greater than 130 Ω**

      Refer to Scan Tool Does Not Communicate with High Speed GMLAN Device to test for an open/high resistance in the serial data circuit.

    - **If between 110 - 130 Ω**
13. Replace the device that is not communicating.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Serial Data Circuit Wiring Repairs
- Control Module References for device replacement, programming and setup

DTC U2401: BATTERY ENERGY CONTROL MODULE DEDICATED BUS 1 OFF

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U2401

Battery Energy Control Module Dedicated Bus 1 Off

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The Battery Energy Control Module dedicated bus is a communication bus used to communicate between the Battery Energy Control Module and the Hybrid/EV Battery Interface Control Modules inside the Hybrid/EV Battery Pack assembly. The Battery Energy Control Module dedicated bus does not communicate with the scan tool.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

The device setting the DTC has received too many transmit errors on the Battery Energy Control Module dedicated serial data circuits.

Action Taken When the DTC Sets

DTC U2401 is a type A DTC.

Conditions for Clearing the DTC

- DTC U2401 is a type A DTC.
- No bus off status.

Diagnostic Aids

The Hybrid/EV Battery Interface Control Modules 1 - 12 are all internal to the Battery Energy Control Module.

Circuit/System Verification

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle in Service Mode.
2. Verify each scan tool Hybrid/EV Battery 1 - 96 parameters are between 3.45 - 4.05 V and all readings are within 0.03 V of each other.
   - **If not between 3.45 - 4.05 V or not within 0.03 V of each other**

     Refer to DTC P0B3B-P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06, or P1E4C-P1E8B .
   - **If between 3.45 - 4.05 V and within 0.03 V of each other**
3. Verify that DTC U2401 is not set.
   - **If the DTC is set**

     Replace the K16 Battery Energy Control Module.
   - **If the DTC is not set**
4. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Control Module References for device replacement, programming and setup

DTC U2409: TRANSMISSION RANGE CONTROL MODULE HIGH SPEED CAN BUS OFF

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U2409

Transmission Range Control Module High Speed CAN Bus Off

For symptom byte information, refer to **Symptom Byte List** .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High Speed GMLAN Serial Data (+)	U0073, U2409*	U0073, U2409*	U0073, U2409*	-
High Speed GMLAN Serial Data (-)	U0073, U2409*	U0073, U2409*	U0073, U2409*	-
* Other DTCs may set with this fault.				

Circuit/System Description

The high speed GMLAN serial data circuits are serial data buses used to communicate information between the devices. The high speed GMLAN serial data circuits also connect directly to the X84 Data Link Connector (DLC) for programming purposes. If this serial data system is inoperative, some devices may still be able to communicate with the scan tool due to other serial data systems but not with each other.

Conditions for Running the DTC

- Supply voltage to the devices are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the high speed GMLAN serial data circuits more than 3 times.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

    - **If DTC U2409 is not set**
3. All OK

DTC U240A: TRANSMISSION RANGE CONTROL MODULE CHASSIS EXPANSION CAN BUS OFF

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC U240A

Transmission Range Control Module Chassis Expansion CAN Bus Off

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Chassis High Speed GMLAN Serial Data (+)	U0077, U240A*	U0077, U240A*	U0077, U240A*	-
Chassis High Speed GMLAN Serial Data (-)	U0077, U240A*	U0077, U240A*	U0077, U240A*	-
* Other DTCs may set with this fault.				

Circuit/System Description

The chassis high speed GMLAN serial data circuits are serial data buses used to communicate information between the devices. The chassis high speed GMLAN serial data circuits also connect directly to the X84 Data Link Connector (DLC) for programming purposes. If this serial data system is inoperative, the devices will still communicate with the scan tool due to other serial data systems but not with each other.

Conditions for Running the DTC

- Supply voltage to the devices are in the normal operating range.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

The device setting the DTC has attempted to establish communications on the chassis high speed GMLAN serial data circuits more than 3 times.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

3. All OK

DTC U2500-U25FF: INVALID DATA RECEIVED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

Refer to **Control Module U Code List** .

Circuit/System Description

Some devices are constantly receiving information from other devices through serial data communication network. The invalid data code will be set when a receiving device detects a discrepancy in information it receives from another device causing its integrity to be questioned. The symptom byte listed in the DTC Descriptor is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

Battery voltage is between 9 - 16 V and data link communications operate normally.

Conditions for Setting the DTC

The device is not configured properly.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Ground	-	U2602	-	-
* Scan Tool Does Not Communicate With High Speed GMLAN Device				

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

This diagnostic is used to check the loss of communication with the Hybrid/EV Powertrain Control Module 2 on high speed GMLAN bus. The Battery Energy Control Module supervises a periodic serial data message to check the communication status of the Hybrid/EV Powertrain Control Module 2. If this message is not received within 400 ms, the Battery Energy Control Module increases its fail count. When this fail count is over X Cal Value (7) during Y Cal Value (10 samples), the diagnostic status of this code is set to Failed and transmitted over high voltage energy high speed GMLAN bus to the Hybrid/EV Powertrain Control Module 2.

Conditions for Running the DTC

- Vehicle ON.
- The system voltage is at least 9 V.
- The DTC U180B is not set.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received within 400 ms.

Action Taken When the DTC Sets

The DTC U2602 is a type B DTC.

Conditions for Clearing the DTC

The DTC U2602 is a type B DTC.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
    - A device on the data communication circuit was disconnected while the communication circuit is awake.
    - Power to one or more devices was interrupted during diagnosis.
    - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
    - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
    - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- A device may have a U code stored in history that does not require any repairs. Issues with late or corrupted messages between devices can be temporary with no apparent symptom or complaint; this does not mean the device is faulty. Do not replace a device based only on a history U code.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with one or more GMLAN serial data systems inoperative. This condition is due to the device using multiple GMLAN busses.
- Use **Data Link References** to determine what GMLAN serial data communications the non communicating device uses.

- The device may not have internal protection for specific control circuits and may open a B+ or ignition fuse. If a fuse is open and the B+ or ignition circuit is not shorted to ground, ensure none of the control circuits are shorted to ground before replacing the non communicating device.

   - **If none of the DTCs are set**
3. Refer to Circuit/System Testing.

Circuit/System Testing

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

NOTE: **Use the schematics and connector end views to identify the device's ground, B+, ignition, accessory wake up serial data, and serial data circuit terminals.**

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K114B Hybrid/EV Powertrain Control Module 2. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If the test lamp illuminates**
5. Vehicle in Service Mode.
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.

        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If the test lamp illuminates**
7. Vehicle in Service Mode.
8. If equipped, verify a test lamp illuminates between the accessory wakeup serial data circuit terminal and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the harness connectors at the K9 Body Control Module.
    2. Test for infinite resistance between the accessory wakeup serial data circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the accessory wakeup serial data circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
9. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the X357 and X358 harness connectors at the A4 Hybrid/EV Battery Pack. It may take up to 2 min for all vehicle systems to power down.
10. Test for less than 2 Ω in each serial data circuits end to end between the K114B Hybrid/EV Powertrain Control Module 2 and the A4 Hybrid/EV Battery Pack.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
11. Vehicle OFF, disable the high voltage system. Refer to **High Voltage Disabling** .
12. Reconnect the 12 V battery.
13. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the X8 harness connector at the K16 Battery Energy Control Module. It may take up to 2 min for all vehicle systems to power down.
14. Test for less than 2 Ω in each serial data circuits end to end between the A4 Hybrid/EV Battery Pack and the K16 Battery Energy Control Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
15. Replace the K114B Hybrid/EV Powertrain Control Module 2.

Circuit/System Description

Devices connected to the serial data circuits monitor for serial data communications during normal vehicle operation. Operating information and commands are exchanged among the devices. The devices have prerecorded information about what messages are needed to be exchanged on the serial data circuits, for each virtual network. The messages are supervised and also, some periodic messages are used by the receiver device as an availability indication of the transmitter device. Each message contains the identification number of the transmitter device.

The scan tool does not communicate the Hybrid/EV Battery Interface Control Modules 1 - 12 on Battery Energy Control Module dedicated bus.

Conditions for Running the DTC

- The device is awake and communicating.
- The system voltage is between 9 - 16 V.

Conditions for Setting the DTC

There is no temperature report message from Hybrid/EV Battery Interface Control Modules 1 - 12 to Battery Energy Control Module within 4 s.

Action Taken When the DTC Sets

The DTC U2603, U2604, U2605, U2606, U2617, U2618, U2619, U2620, U2621, U2622, U2623, and U2624 are type A DTCs.

Conditions for Clearing the DTC

The DTC U2603, U2604, U2605, U2606, U2617, U2618, U2619, U2620, U2621, U2622, U2623, and U2624 are type A DTCs.

Diagnostic Aids

The Hybrid/EV Battery Interface Control Modules 1 - 12 are all internal to the Battery Energy Control Module.

Circuit/System Verification

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Vehicle in Service Mode.
2. Verify that DTC U2401 is not set.
   - **If the DTC is set**

     Refer to DTC U2401.

   - **If the DTC is not set**
3. Verify each scan tool Hybrid/EV Battery 1 - 96 parameters are between 3.45 - 4.05 V and all readings are within 0.03 V of each other.
   - **If not between 3.45 - 4.05 V or not within 0.03 V of each other**

     Refer to DTC P0B3B-P0BBB, P1B16-P1B2D, P1B45-P1BFE, P1E01-P1E06, or P1E4C-P1E8B .

   - **If between 3.45 - 4.05 V and within 0.03 V of each other**
4. Verify that DTC U2603, U2604, U2605, U2606, U2617, U2618, U2619, U2620, U2621, U2622, U2623, or U2624 is not set.
   - **If any of the DTCs are set**

     Replace the K16 Battery Energy Control Module.

   - **If none of the DTCs are set**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

DTC U3000: CONTROL MODULE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC U3000

Control Module

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

The internal fault detection is handled inside the device. The symptom byte information is for engineering reference only. No external circuit diagnosis is involved.

Conditions for Running the DTC

The device runs the program to detect an internal fault when power up is commanded. The only requirements are voltage and ground.

Conditions for Setting the DTC

The device has detected an internal malfunction.

Action Taken When the DTC Sets

The device refuses all additional inputs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold of 50, without a repeat of the malfunction.

Diagnostic Aids

- This DTC may be stored as a history DTC without affecting the operation of the device.
- If stored only as a history DTC and not retrieved as a current DTC, do not replace the device.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC U3000 is not set.
    - **If DTC U3000 is set with symptom byte 43, 47, or 4B**
    1. Program the device that set the DTC.
    2. Verify the DTC does not set.
        - If the DTC sets, replace the device that set the DTC.
        - If the DTC does not set
    3. All OK.
    - **If DTC U3000 is set with any symptom byte, except 43, 47, or 4B**

      Replace the device that set the DTC.

    - **If DTC U3000 is not set**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

SYMPTOMS - DATA COMMUNICATIONS

NOTE: **The following steps must be completed before using the symptom tables.**

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
   - There are no Diagnostic Trouble Codes (DTC) set.
   - The devices can communicate via the serial data links.

2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Data Link Communications Description and Operation** .

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Scan Tool Does Not Power Up**
- **Scan Tool Does Not Communicate with High Speed GMLAN Device**
- **Scan Tool Does Not Communicate with Low Speed GMLAN Device**
- **Scan Tool Does Not Communicate with Gateway Expansion High Speed GMLAN Device**
- **Scan Tool Does Not Communicate with Gateway Isolated High Speed GMLAN Device**
- **Scan Tool Does Not Communicate with Gateway Isolated Low Speed GMLAN Device**

SCAN TOOL DOES NOT POWER UP

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Data Link Connector B+	1	1	-	-
Data Link Connector Ground	-	1	-	-
1. Scan Tool Does Not Power Up				

Circuit/System Description

The data link connector (DLC) is a standardized 16 cavity connector. Connector design and location is dictated by an industry wide standard, and is required to provide the following:

- Scan tool B+ voltage at terminal 16
- Scan tool ground at terminal 4
- Common ground at terminal 5

Diagnostic Aids

- The scan tool will power up with the vehicle OFF. Some devices however, will not communicate unless the vehicle is ON and the power mode master device sends the appropriate power mode message.
- If the B+ circuit, ground circuits, and connections of the data link connector are functioning properly, the malfunction must be due to the scan tool.

Circuit/System Testing

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 2 Ω between each of the X84 data link connector ground circuit terminals listed below and ground.
    - Ground circuit terminal 4
    - Ground circuit terminal 5
    - **If 2 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 2 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 16 at the X84 data link connector and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
    - **If the test lamp illuminates**
5. Refer to the scan tool user guide.

SCAN TOOL DOES NOT COMMUNICATE WITH GATEWAY EXPANSION HIGH SPEED GMLAN DEVICE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Gateway Expansion High Speed GMLAN Serial Data (+) or High Speed GMLAN Serial Data (+) (8)	U007B	U007B	U007B	-
Gateway Expansion High Speed GMLAN Serial Data (-) or High Speed GMLAN Serial Data (-) (8)	U007B	U007B	U007B	-

Circuit/System Description

The devices connected to the gateway expansion high speed GMLAN serial data circuits (circuit numbers 3935 & 3936) monitor for serial data communications during normal vehicle operation. The K56 Serial Data Gateway Module acts as the gateway module between devices on primary high speed GMLAN bus and devices on gateway expansion high speed GMLAN bus. The gateway expansion high speed GMLAN serial data bus uses terminating resistors that are in parallel with the gateway expansion high speed GMLAN (+) and (-) circuits.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073, U0074, U0075, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Attempt to communicate with all devices on the gateway expansion high speed GMLAN serial data circuits. Refer to **Data Link References** to determine which devices are on the gateway expansion high speed GMLAN bus.
4. Verify which devices are communicating on the gateway expansion high speed GMLAN serial data circuits.
    - **If only one device is not communicating**

      Refer to Circuit/System Testing - Testing the Device Circuits.

    - **If one or more devices are communicating but not all, except the K56 Serial Data Gateway Module**

      Refer to Circuit/System Testing - Testing the Serial Data Circuit for an Open/High Resistance.

    - **If none of the devices are communicating, except the K56 Serial Data Gateway Module**
5. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Each device may need to be disconnected to isolate a circuit fault. Use the schematic to identify the following:**

- **Gateway expansion high speed GMLAN devices and terminating resistors the vehicle is equipped with**
- **Device locations on the gateway expansion high speed GMLAN serial data circuits**
- **Each device's ground, B+, ignition, and gateway expansion high speed GMLAN serial data circuit terminals**

Some devices with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the device for each of the following tests.

1. Ignition/Vehicle OFF, disconnect the harness connectors with the gateway expansion high speed GMLAN serial data circuits at an easily accessible device that is not communicating. Refer to Data Link References to determine which devices are on the gateway expansion high speed GMLAN bus.
2. Ignition ON/Vehicle In Service Mode.
3. Test for less than 4.5 V between each gateway expansion high speed GMLAN serial data circuit at the device that was just disconnected and ground.
    - **If 4.5 V or greater**

      Refer to Testing the Serial Data Circuits for a Short to Voltage.

    - **If less than 4.5 V**
4. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
5. Test for greater than 100 Ω between each gateway expansion high speed GMLAN serial data circuit at the device that was just disconnected and ground.
    - **If 100 Ω or less**

      Refer to Testing the Serial Data Circuits for a Short to Ground.

    - **If greater than 100 Ω**
6. Test for 110 - 130 Ω between each pair of the gateway expansion high speed GMLAN serial data circuits at the device that was just disconnected:
    - **If less than 110 Ω**

      Refer to Testing the Serial Data Circuits for a Short between the Circuits.

    - **If greater than 130 Ω**

      Refer to Testing the Serial Data Circuits for an Open/High Resistance.

    - **If between 110 - 130 Ω**
7. Refer to Testing the Device Circuits.

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition/Vehicle OFF, disconnect the harness connectors with the gateway expansion high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to voltage, ignition ON/Vehicle In Service Mode.
2. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
    - **If each serial data circuit is 4.5 V or less**
    1. Ignition/Vehicle OFF.
    2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
        - If 10 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 10 Ω, replace the device that was disconnected.
    - **If any serial data circuit is greater than 4.5 V**
3. Repeat step 1 until one of the following conditions are isolated:
    - A short to voltage on the serial data circuit between two devices or splice packs, if equipped.
    - A short to voltage on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors with the gateway expansion high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to ground.

3. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
    - **If each serial data circuit is 100 Ω or greater**

      Replace the device that was disconnected.

    - **If any serial data circuit is less than 100 Ω**
4. Repeat step 1 until one of the following conditions are isolated:
    - A short to ground on the serial data circuit between two devices or splice packs, if equipped.
    - A short to ground on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short between the Circuits

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Connect the harness connectors at the device that was previously disconnected.
3. Disconnect the harness connectors with the gateway expansion high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted together.
4. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 110 Ω or greater**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is less than 110 Ω**
5. Repeat step 2 until one of the following conditions are isolated:
    - Serial data circuits shorted together between two devices or splice packs, if equipped.
    - Serial data circuits shorted together between a device and a terminating resistor.
    - A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Connect the harness connectors at the device that was previously disconnected.
3. Disconnect the harness connectors with the gateway expansion high speed GMLAN serial data circuits at another device, in the direction of the circuit with the open/high resistance.
4. Test for less than 130 Ω between each pair of the serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 130 Ω or less**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is greater than 130 Ω**
5. Repeat step 2 until one of the following conditions are isolated:
    - An open/high resistance on the serial data circuit between two devices or splice packs, if equipped.
    - An open/high resistance on the serial data circuit between a device and a terminating resistor.
    - An open/high resistance terminating resistor.

Testing the Device Circuits

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal at the device that was just disconnected and ground.

   - **If 10 Ω or greater**
   1. Ignition/Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
4. Ignition ON/Vehicle In Service Mode.
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
   - **If the test lamp does not illuminate**
   1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the control module that controls the ignition circuit.
   - **If the test lamp illuminates**
7. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K56 Serial Data Gateway Module. It may take up to 2 min for all vehicle systems to power down.
8. Test for less than 2 Ω in each of the gateway expansion high speed GMLAN serial data circuits end to end between the non communicating device and the K56 Serial Data Gateway Module.
   - **If 2 Ω or greater**

Repair the open/high resistance in the serial data circuit.

- **If less than 2 Ω**

9. Test for less than 2 Ω in each of the primary high speed GMLAN serial data circuits (circuit numbers 2500 & 2501) end to end between the K56 Serial Data Gateway Module and the appropriate X84 Data Link Connector (DLC) terminals listed below.
    - X84 Data Link Connector high speed GMLAN serial data circuit terminal 6
    - X84 Data Link Connector high speed GMLAN serial data circuit terminal 14
    - **If 2 Ω or greater**

      Repair the open/high resistance in the high speed GMLAN serial data circuit.

    - **If less than 2 Ω**
10. Replace the non communicating device that was disconnected.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

SCAN TOOL DOES NOT COMMUNICATE WITH GATEWAY ISOLATED HIGH SPEED GMLAN DEVICE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Gateway Isolated High Speed GMLAN Serial Data (+) or High Speed GMLAN Serial Data (+) (9)	U007C	U007C	U007C	-
Gateway Isolated High Speed GMLAN Serial Data (-) or High Speed GMLAN Serial Data (-) (9)	U007C	U007C	U007C	-

Circuit/System Description

The devices connected to the gateway isolated high speed GMLAN serial data circuits (circuit numbers 1304 & 1305) monitor for serial data communications during normal vehicle operation. The K56 Serial Data Gateway Module acts as the gateway module between devices on primary high speed GMLAN bus and devices on gateway isolated high speed GMLAN bus. The gateway isolated high speed GMLAN serial data bus uses terminating resistors that are in parallel with the gateway isolated high speed GMLAN (+) and (-) circuits.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073, U0074, U0075, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
   - **If any of the DTCs are set**

     Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

   - **If none of the DTCs are set**
3. Attempt to communicate with all devices on the gateway isolated high speed GMLAN serial data circuits. Refer to **Data Link References** to determine which devices are on the gateway isolated high speed GMLAN bus.
4. Verify which devices are communicating on the gateway isolated high speed GMLAN serial data circuits.
   - **If only one device is not communicating**

     Refer to Circuit/System Testing - Testing the Device Circuits.

- **If one or more devices are communicating but not all, except the K56 Serial Data Gateway Module**

  Refer to Circuit/System Testing - Testing the Serial Data Circuit for an Open/High Resistance.

- **If none of the devices are communicating, except the K56 Serial Data Gateway Module**

5. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Each device may need to be disconnected to isolate a circuit fault. Use the schematic to identify the following:**

- **Gateway isolated high speed GMLAN devices and terminating resistors the vehicle is equipped with**
- **Device locations on the gateway isolated high speed GMLAN serial data circuits**
- **Each device's ground, B+, ignition, and gateway isolated high speed GMLAN serial data circuit terminals**

Some devices with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the device for each of the following tests.

1. Ignition/Vehicle OFF, disconnect the harness connectors with the gateway isolated high speed GMLAN serial data circuits at an easily accessible device that is not communicating. Refer to Data Link References to determine which devices are on the gateway isolated high speed GMLAN bus.
2. Ignition ON/Vehicle In Service Mode.
3. Test for less than 4.5 V between each gateway isolated high speed GMLAN serial data circuit at the device that was just disconnected and ground.
   - **If 4.5 V or greater**

     Refer to Testing the Serial Data Circuits for a Short to Voltage.

   - **If less than 4.5 V**
4. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
5. Test for greater than 100 Ω between each gateway isolated high speed GMLAN serial data circuit at the device that was just disconnected and ground.
   - **If 100 Ω or less**

     Refer to Testing the Serial Data Circuits for a Short to Ground.

   - **If greater than 100 Ω**
6. Test for 110 - 130 Ω between each pair of the gateway isolated high speed GMLAN serial data circuits at the device that was just disconnected:
   - **If less than 110 Ω**

     Refer to Testing the Serial Data Circuits for a Short between the Circuits.

   - **If greater than 130 Ω**

     Refer to Testing the Serial Data Circuits for an Open/High Resistance.

   - **If between 110 - 130 Ω**
7. Refer to Testing the Device Circuits.

Testing the Serial Data Circuits for a Short to Voltage

1. Ignition/Vehicle OFF, disconnect the harness connectors with the gateway isolated high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to voltage, ignition ON/Vehicle In Service Mode.
2. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 4.5 V or less**
   1. Ignition/Vehicle OFF.
   2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
      - If 10 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 10 Ω, replace the device that was disconnected.
   - **If any serial data circuit is greater than 4.5 V**
3. Repeat step 1 until one of the following conditions are isolated:
   - A short to voltage on the serial data circuit between two devices or splice packs, if equipped.
   - A short to voltage on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors with the gateway isolated high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to ground.
3. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 100 Ω or greater**

     Replace the device that was disconnected.

   - **If any serial data circuit is less than 100 Ω**
4. Repeat step 1 until one of the following conditions are isolated:
   - A short to ground on the serial data circuit between two devices or splice packs, if equipped.
   - A short to ground on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short between the Circuits

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Connect the harness connectors at the device that was previously disconnected.
3. Disconnect the harness connectors with the gateway isolated high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted together.
4. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
   - **If each pair of serial data circuits is 110 Ω or greater**

     Replace the device that was disconnected.

   - **If any pair of serial data circuits is less than 110 Ω**
5. Repeat step 2 until one of the following conditions are isolated:
   - Serial data circuits shorted together between two devices or splice packs, if equipped.
   - Serial data circuits shorted together between a device and a terminating resistor.
   - A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Connect the harness connectors at the device that was previously disconnected.
3. Disconnect the harness connectors with the gateway isolated high speed GMLAN serial data circuits at another device, in the direction of the circuit with the open/high resistance.
4. Test for less than 130 Ω between each pair of the serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 130 Ω or less**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is greater than 130 Ω**
5. Repeat step 2 until one of the following conditions are isolated:
    - An open/high resistance on the serial data circuit between two devices or splice packs, if equipped.
    - An open/high resistance on the serial data circuit between a device and a terminating resistor.
    - An open/high resistance terminating resistor.

Testing the Device Circuits

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal at the device that was just disconnected and ground.
    - **If 10 Ω or greater**
        1. Ignition/Vehicle OFF.
        2. Test for less than 2 Ω in the ground circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
        1. Ignition/Vehicle OFF, remove the test lamp.
        2. Test for less than 2 Ω in the B+ circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
        1. Ignition/Vehicle OFF, remove the test lamp.
        2. Test for infinite resistance between the B+ circuit and ground.
            - If less than infinite resistance, repair the short to ground on the circuit.
            - If infinite resistance, replace the disconnected device.
    - **If the test lamp illuminates**
4. Ignition ON/Vehicle In Service Mode.
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
        1. Ignition/Vehicle OFF, remove the test lamp.
        2. Test for less than 2 Ω in the ignition circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**

    1. Ignition/Vehicle OFF, remove the test lamp.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the disconnected device.
    - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
    - **If the test lamp does not illuminate**
    1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the control module that controls the ignition circuit.
    - **If the test lamp illuminates**
7. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K56 Serial Data Gateway Module. It may take up to 2 min for all vehicle systems to power down.
8. Test for less than 2 Ω in each of the gateway isolated high speed GMLAN serial data circuits end to end between the non communicating device and the K56 Serial Data Gateway Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
9. Test for less than 2 Ω in each of the primary high speed GMLAN serial data circuits (circuit numbers 2500 & 2501) end to end between the K56 Serial Data Gateway Module and the appropriate X84 Data Link Connector (DLC) terminals listed below.
    - X84 Data Link Connector high speed GMLAN serial data circuit terminal 6
    - X84 Data Link Connector high speed GMLAN serial data circuit terminal 14
    - **If 2 Ω or greater**

      Repair the open/high resistance in the primary high speed GMLAN serial data circuit.

    - **If less than 2 Ω**
10. Replace the non communicating device that was disconnected.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Serial Data Circuit Wiring Repairs
- Control Module References for device replacement, programming and setup

SCAN TOOL DOES NOT COMMUNICATE WITH GATEWAY ISOLATED LOW SPEED GMLAN DEVICE

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Gateway Isolated Low Speed GMLAN Serial Data or Low Speed GMLAN Serial Data #2 (Circuit #1102)	U007D	U0100-U02FF	U007D	-

Circuit/System Description

The gateway isolated low speed GMLAN serial data bus is used to communicate information between the devices. The serial data is transmitted over a single wire (circuit number 1102) to the appropriate devices. The K56 Serial Data Gateway Module acts as the gateway module between devices on low speed GMLAN bus and devices on gateway isolated low speed GMLAN bus.

Conditions for Running the DTC

- The system voltage is between 9 - 16 V.
- The vehicle power mode requires serial data communications.

Conditions for Setting the DTC

A supervised periodic message that includes the transmitter device availability has not been received.

Action Taken When the DTC Sets

- The device suspends all message transmission.
- The device uses default values for all parameters received on the serial data circuits.
- The device inhibits the setting of all other communication DTCs.

Conditions for Clearing the DTC

- A current DTC clears when the malfunction is no longer present.
- A history DTC clears when the device ignition cycle counter reaches the reset threshold, without a repeat of the malfunction.

Circuit/System Verification

1. Ignition ON/Vehicle In Service Mode.
2. Verify that DTC U0073, U0074, U0075, U0077, U0078, U007A, P06E4, P1EB9, U1814, U2099, B1325, B1330, B1370, B1380, B1424, B1428, B1440, B1441, B1517, C0800, C0899, C12E1, P0560, or P0562 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Verify that the K56 Serial Data Gateway Module is communicating.
    - **If the K56 Serial Data Gateway Module is not communicating**

      Refer to **DTC U0100-U02FF** to diagnose the K56 Serial Data Gateway Module.

    - **If the K56 Serial Data Gateway Module is communicating**
4. Attempt to communicate with all devices on the gateway isolated low speed GMLAN serial data circuit. Refer to **Data Link References** to determine which devices are on the gateway isolated low speed GMLAN bus.
5. Verify which devices are communicating on the gateway isolated low speed GMLAN serial data circuit.
    - **If only one device is not communicating**

      Refer to Circuit/System Testing - Testing the Device Circuits.

    - **If one or more devices are communicating but not all, except the K56 Serial Data Gateway Module**

      Refer to Circuit/System Testing - Testing the Serial Data Circuit for an Open/High Resistance.

    - **If none of the devices are communicating, except the K56 Serial Data Gateway Module**
6. Refer to Circuit/System Testing.

Circuit/System Testing

NOTE: **Use the schematic to identify the following:**

- **Gateway Isolated low speed GMLAN devices the vehicle is equipped with**
- **Device and splice pack locations on the gateway isolated low speed GMLAN serial data circuit**
- **The gateway isolated low speed GMLAN serial data circuit terminals for each device or splice pack**

1. Ignition/Vehicle OFF, disconnect the appropriate harness connectors at all gateway isolated low speed GMLAN serial data splice packs, ignition ON/Vehicle In Service Mode.
2. Test for less than 4.5 V between each gateway isolated low speed GMLAN serial data circuit at a splice pack and ground.
    - **If any serial data circuit is greater than 4.5 V**
    1. Ignition/Vehicle OFF, disconnect all devices on the failed serial data circuit, ignition ON/Vehicle In Service Mode.
    2. Test for less than 1 V between each section of the failed serial data circuit and ground.
        - If 1 V or greater, repair the short to voltage in the circuit.
        - If less than 1 V
    3. Connect the splice pack and connect the first device on the failed serial data circuit, ignition ON/Vehicle In Service Mode.

   4. Verify the scan tool communicates or not with the gateway isolated low speed GMLAN serial data circuit.
      - If the scan tool does not communicate, replace the device that was just connected.
      - If the scan tool communicates and there are more devices to connect, connect the next device and repeat step 2.4.
      - If the scan tool communicates and there are no more devices to connect
   5. All OK.
   - **If all serial data circuits are less than 4.5 V**
3. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the appropriate harness connectors at all gateway isolated low speed GMLAN serial data splice packs. It may take up to 2 min for all vehicle systems to power down.
4. Test for greater than 100 Ω between each gateway isolated low speed GMLAN serial data circuit at a splice pack and ground.
   - **If any serial data circuit is 100 Ω or less**
   1. Disconnect all devices on the failed serial data circuit.
   2. Test for infinite resistance between each section of the failed serial data circuit and ground.
      - If less than infinite resistance, repair the short to ground in the circuit.
      - If infinite resistance
   3. Connect the splice pack and connect the first device on the failed serial data circuit, ignition ON/Vehicle In Service Mode.
   4. Verify the scan tool communicates or not with the gateway isolated low speed GMLAN serial data circuit.
      - If the scan tool does not communicate, replace the device that was just connected.
      - If the scan tool communicates and there are more devices to connect, connect the next device and repeat step 4.4.
      - If the scan tool communicates and there are no more devices to connect
   5. All OK.
   - **If all serial data circuits are greater than 100 Ω**
5. Inspect all gateway isolated low speed GMLAN splice packs for damage.

Testing the Serial Data Circuit for an Open/High Resistance

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
2. Disconnect the harness connectors at the gateway isolated low speed GMLAN device that is not communicating and closest to the K56 Serial Data Gateway Module.
3. Disconnect the harness connectors at the K56 Serial Data Gateway Module.
4. Test for less than 2 Ω in the gateway isolated low speed GMLAN serial data circuit (circuit number 1102) end to end between the non-communicating device and the K56 Serial Data Gateway Module.
   - **If 2 Ω or greater**

     Repair the open/high resistance in the serial data circuit.

   - **If less than 2 Ω**
5. Test for less than 2 Ω in the primary low speed GMLAN serial data circuit (circuit number 5060) end to end between the K56 Serial Data Gateway Module and the X84 Data Link Connector terminal 1.
   - **If 2 Ω or greater**

     Repair the open/high resistance in the serial data circuit.

   - **If less than 2 Ω**
6. Replace the non-communicating device that was disconnected.

Testing the Device Circuits

1. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the Gateway isolated low speed GMLAN device that is not communicating. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between each ground circuit terminal at the device that was just disconnected and ground.
   - **If 10 Ω or greater**
   1. Ignition/Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
4. Ignition ON/Vehicle In Service Mode.
5. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Ignition/Vehicle OFF, remove the test lamp.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the disconnected device.
   - **If the test lamp illuminates**
6. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
   - **If the test lamp does not illuminate**
   1. Ignition/Vehicle OFF, remove the test lamp, disconnect the harness connectors at the control module that controls the ignition circuit.
   2. Test for infinite resistance between the ignition circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the ignition circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the control module that controls the ignition circuit.

- **If the test lamp illuminates**

7. Ignition/Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 m (9.8 ft) away from vehicle. Disconnect the harness connectors at the K56 Serial Data Gateway Module. It may take up to 2 min for all vehicle systems to power down.
8. Test for less than 2 Ω in each of the gateway isolated low speed GMLAN serial data circuits end to end between the non communicating device and the K56 Serial Data Gateway Module.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
9. Test for less than 2 Ω in the primary low speed GMLAN serial data circuit (circuit number 5060) end to end between the K56 Serial Data Gateway Module and X84 Data Link Connector terminal 1.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the low speed GMLAN serial data circuit.

    - **If less than 2 Ω**
10. Replace the non communicating device that was disconnected.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

SCAN TOOL DOES NOT COMMUNICATE WITH HIGH SPEED GMLAN DEVICE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
High Speed GMLAN Serial Data (+)	1	U0100 - U02FF*	1	-
High Speed GMLAN Serial Data (-)	1	U0100 - U02FF*	1	-
Ground (DLC, terminal 5)	-	1	-	-
* No communications with one or more high speed GMLAN devices. An open in only one high speed GMLAN serial data circuit may allow degraded communication between the devices. An open between the data link connector (DLC) and the first splice/device will only affect the communication with the scan tool. The devices will still communicate. 1. No communication with any high speed GMLAN device				

Circuit/System Description

The serial data is transmitted on two twisted wires that allow speeds up to 500 Kb/s. The twisted pair is terminated with two 120 Ω resistors, one is internal to the engine control module (ECM) and the other can be a separate resistor in a connector assembly or in another device. The resistors are used as the load for the High Speed GMLAN bus during normal vehicle operation. The high speed GMLAN is a differential bus. The high speed GMLAN serial data bus (+) and high speed GMLAN serial data (-) are driven to opposite extremes from a rest or idle level of approximately 2.5 V. Driving the lines to their extremes, adds 1 V to the high speed GMLAN serial data bus (+) circuit and subtracts 1 V from the high speed GMLAN serial data bus (-) circuit. If serial data is lost, devices will set a no communication code against the non-communicating device. Note that a loss of serial data DTC does not represent a failure of the device that set it.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U-code present. However, there is no associated "current" or "active" status. Loss-of-communication U-codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis.
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss-of-communication U-code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between some devices and the scan tool with the high speed GMLAN serial data system inoperative. This condition is due to those devices using multiple serial data communication systems.
- An open in the DLC ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle.
- The engine will not start when there is a total malfunction of the high speed GMLAN serial data bus.
- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC) and no low speed GMLAN communications with the scan tool.
- These conditions may be caused by the installation of an aftermarket navigation radio module (see bulletins). Some customers may comment of one or more of the following concerns:
  - Vehicle will not crank
  - Vehicle cranks but will not start
  - Vehicle stability enhancement system warning lights and messages
  - PRNDL gear indicator position errors

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify two or more devices are not communicating on the high speed GMLAN serial data circuit. Refer to Data Link References to determine how many devices should be communicating on the bus.
    - **If only one device is not communicating**

      Refer to Circuit/System Testing - Testing the Device Circuits.

    - **If two or more devices are not communicating**
3. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. Disconnect the scan tool from the X84 data link connector. The following tests will be done at the X84 data link connector. It may take up to 2 minutes for all vehicle systems to power down.
4. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
5. Vehicle in Service Mode.
6. Test for less than 4.5 V between the serial data circuits listed below and ground.
    - Terminal 6
    - Terminal 14
    - **If 4.5 V or greater**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Voltage.

    - **If less than 4.5 V**
7. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
8. Test for greater than 100 Ω between the serial data circuits listed below and ground.
    - Terminal 6
    - Terminal 14
    - **If 100 Ω or less**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Ground.

    - **If greater than 100 Ω**
9. Test for 50 - 70 Ω between the serial data circuit terminals 6 and 14.
    - **If less than 35 Ω**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.

    - **If between 35 - 50 Ω**

There may be a third terminating resistor between the serial data circuits. This can happen if the incorrect device is installed. Some devices are available with and without the terminating resistors installed to reduce the need of terminating resistors in the wiring harness. Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short between the Circuits.

- **If greater than 70 Ω but less than infinite**

  Refer to Circuit/System Testing - Testing the Serial Data Circuits for an Open/High Resistance.

- **If infinite resistance**

  Repair the open/high resistance in the circuit between the X84 data link connector and the first splice/device in the serial data circuit.

- **If between 50 - 70 Ω**

10. Refer to Circuit/System Testing - Testing the Device Circuits.

Circuit/System Testing

NOTE: **Some devices with an internal terminating resistor have a loop in the harness that connects the internal terminating resistor to the serial data circuit. When wired this way, test these loop circuits for the appropriate failure mode short to voltage, short to ground, or open/high resistance prior to replacing the device for each of the following tests.**

Each device may need to be disconnected to isolate a circuit fault. Use the schematics and connector end views to identify the following:

- **High speed GMLAN devices the vehicle is equipped with**
- **High speed GMLAN serial data circuit terminating resistors**
- **Device locations on the high speed GMLAN serial data circuits**
- **Each device's ground, B+, ignition, and high speed GMLAN serial data circuit terminals**

Testing the Serial Data Circuits for a Short to Voltage

1. Vehicle OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible device, Vehicle in Service Mode.
2. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 4.5 V or less**
   1. Vehicle OFF.
   2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
      - If 10 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 10 Ω, replace the device that was disconnected.
   - **If any serial data circuit is greater than 4.5 V**
3. Vehicle OFF, disconnect the harness connectors with the high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to voltage, Vehicle in Service Mode.
4. Test for greater than 4.5 V between each serial data circuit at the device connector that was just disconnected and ground.
   - **If each serial data circuit is 4.5 V or less**
   1. Vehicle OFF.
   2. Test for less than 10 Ω between each of the device's ground circuit terminals and ground.
      - If 10 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 10 Ω, replace the device that was disconnected.

- **If any serial data circuit is greater than 4.5 V**

5. Repeat step 3 until one of the following conditions are isolated:
    - A short to voltage on the serial data circuit between two devices or splice packs, if equipped.
    - A short to voltage on the serial data circuit between a device and a terminating resistor.

Testing the Serial Data Circuits for a Short to Ground

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible device.
3. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
    - **If each serial data circuit is 100 Ω or greater**

      Replace the device that was disconnected.

    - **If any serial data circuit is less than 100 Ω**
4. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted to ground.
5. Test for greater than 100 Ω between each serial data circuit at the device connector that was just disconnected and ground.
    - **If both serial data circuits are 100 Ω or greater**

      Replace the device that was disconnected.

    - **If any serial data circuit is less than 100 Ω**
6. Repeat step 4 until one of the following conditions are isolated:
    - A short to ground on the serial data circuit between two devices or splice packs, if equipped.
    - A short to ground on the serial data circuit between a device and a terminating resistor.
    - A short to ground on the serial data circuit between the X84 data link connector and the first device or splice pack.

Testing the Serial Data Circuits for a Short between the Circuits

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 110 Ω or greater**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is less than 110 Ω**
4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another device, in the direction of the circuit shorted together.
6. Test for greater than 110 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 110 Ω or greater**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is less than 110 Ω**

7. Repeat step 4 until one of the following conditions are isolated:
    - Serial data circuits shorted together between two devices or splice packs, if equipped.
    - Serial data circuits shorted together between a device and a terminating resistor.
    - Serial data circuits shorted together between the X84 data link connector and the first device or splice pack.
    - A shorted terminating resistor.

Testing the Serial Data Circuits for an Open/High Resistance

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors with the high speed GMLAN serial data circuits at an easily accessible device that is not communicating.
3. Test for less than 130 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 130 Ω or less**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is greater than 130 Ω**
4. Connect the harness connectors at the device that was disconnected.
5. Disconnect the harness connectors with the high speed GMLAN serial data circuits at another device, in the direction of the circuit with the open/high resistance.
6. Test for less than 130 Ω between each pair of serial data circuits at the device connector that was just disconnected.
    - **If each pair of serial data circuits is 130 Ω or less**

      Replace the device that was disconnected.

    - **If any pair of serial data circuits is greater than 130 Ω**
7. Repeat step 4 until one of the following conditions are isolated:
    - An open/high resistance on the serial data circuit between two devices or splice packs, if equipped.
    - An open/high resistance on the serial data circuit between a device and a terminating resistor.
    - An open/high resistance terminating resistor.

Testing the Device Circuits

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
2. Disconnect the harness connectors at an easily accessible device that is not communicating.
3. Test for less than 10 Ω between each ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
4. Vehicle in Service Mode
5. If equipped, verify a test lamp illuminates between each B+ circuit terminal and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the disconnected device.
    - **If the test lamp illuminates**
6. Vehicle in Service Mode.
7. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which has a fuse in the circuit, and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is OK and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the disconnected device.
    - **If the test lamp illuminates**
8. Vehicle in Service Mode
9. If equipped, verify a test lamp illuminates between each ignition circuit terminal, which is controlled by a control module, and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the harness connectors at the control module that controls the ignition circuit.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the control module that controls the ignition circuit.
    - **If the test lamp illuminates**
10. Vehicle OFF, all access doors closed, all vehicle systems OFF, and all keys at least 3 meters (9.8 feet) away from vehicle. It may take up to 2 minutes for all vehicle systems to power down.
11. Test for less than 130 Ω between each pair of high speed GMLAN serial data circuits at the device connector that was just disconnected.
    - **If any pair of serial data circuits is greater than 130 Ω**

      Repair the open/high resistance in the serial data circuits between the disconnected device and the circuit splice in the serial data circuits.

    - **If each pair of serial data circuits is 130 Ω or less**
12. Replace the device that was disconnected.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Serial Data Circuit Wiring Repairs
- Control Module References for device replacement, programming and setup

SCAN TOOL DOES NOT COMMUNICATE WITH LOW SPEED GMLAN DEVICE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Low Speed GMLAN Serial Data	1	U0100-U02FF*	1	-
Ground (DLC, terminal 5)	-	1*	-	-
* An open between the Data Link Connector (DLC) and the first splice pack/device will only affect the communication with the scan tool. 1. No communication with any low speed GMLAN device				

Circuit/System Description

The serial data is transmitted over a single wire to the appropriate devices. The transmission speed for GMLAN low speed is up to 83.33 Kbit/s. Under normal vehicle operating conditions, the speed of the bus is 33.33 Kbit/s. The devices toggle the serial data circuit between 0 - 5 V during normal communications. To wake the devices connected to the low speed GMLAN serial data circuit, a voltage wake up pulse of 10 V is sent out. If serial data is lost, devices will set a no communication code against the non-communicating device. A loss of serial data communications DTC does not represent a failure of the device that set it.

Diagnostic Aids

- Sometimes, while diagnosing a specific customer concern or after a repair, you may notice a history U code present. However, there is no associated "current" or "active" status. Loss of communication U codes such as these can set for a variety of reasons. Many times, they are transparent to the vehicle operator and technician, and/or have no associated symptoms. Eventually, they will erase themselves automatically after a number of fault-free ignition cycles. This condition would most likely be attributed to one of these scenarios:
  - A device on the data communication circuit was disconnected while the communication circuit is awake.
  - Power to one or more devices was interrupted during diagnosis
  - A low battery condition was present, so some devices stop communicating when battery voltage drops below a certain threshold.
  - Battery power was restored to the vehicle and devices on the communication circuit did not all re-initialize at the same time.
  - If a loss of communication U code appears in history for no apparent reason, it is most likely associated with one of the scenarios above. These are all temporary conditions and should never be interpreted as an intermittent fault, causing you to replace a part.
- Do not replace a device reporting a U code. The U code identifies which device needs to be diagnosed for a communication issue.
- Communication may be available between the device and the scan tool with the low speed GMLAN serial data system inoperative. This condition is due to the device using both the high and low speed GMLAN systems.
- An open in the low speed GMLAN serial data circuit between the splice pack and a device will only affect that specific device. This type of failure will set a loss of communication DTC for each device affected, and the other devices will still communicate.
- An open in the Data Link Connector ground circuit terminal 5 will allow the scan tool to operate but not communicate with the vehicle.
- The engine may not start when there is a total malfunction of the low speed GMLAN serial data circuit.

- Technicians may find various Local Area Network (LAN) communication Diagnostic Trouble Codes (DTC) and no low speed LAN communications with the scan tool.
- These conditions may be caused by the installation of an aftermarket navigation radio device (see bulletins). Some customers may comment of one or more of the following concerns:
  - Vehicle will not crank
  - Vehicle cranks but will not start
  - Vehicle stability enhancement system warning lights and messages
  - PRNDL gear indicator position errors

Circuit/System Verification

NOTE: **Use the schematic to identify the following:**

- **Devices the vehicle is equipped with**
- **Device and splice pack locations on the low speed GMLAN serial data circuit**
- **The low speed GMLAN serial data circuit terminals for each device or splice pack**

1. Attempt to communicate with all devices on the low speed GMLAN serial data circuit. Refer to **Data Link References**.
2. Verify which devices are communicating on the low speed GMLAN serial data circuit.
   - **If only one device is not communicating**

     Diagnose that device only. Refer to **DTC U0100-U02FF** .

   - **If one or more devices are communicating but not all**

     Refer to Circuit/System Testing - Testing the Serial Data Circuit for an Open/High Resistance.

   - **If none of the devices are communicating**

3. Vehicle OFF, all access doors closed, all vehicle systems OFF, all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the scan tool from the X84 Data Link Connector. The following tests will be done at the X84 Data Link Connector.
4. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
5. Vehicle in Service Mode.
6. Test for less than 4.5 V between the serial data circuit terminal 1 and ground.
    - **If 4.5 V or greater**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Voltage.

    - **If less than 4.5 V**
7. Vehicle OFF, all access doors closed, all vehicle systems OFF, all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down.
8. Test for greater than 100 Ω between the serial data circuit terminal 1 and ground.
    - **If 100 Ω or less**

      Refer to Circuit/System Testing - Testing the Serial Data Circuits for a Short to Ground.

    - **If greater than 100 Ω**
9. Disconnect the appropriate harness connector at the first splice pack closest in the circuit to the X84 Data Link Connector.
10. Test for less than 2 Ω between the X84 Data Link Connector's serial data circuit terminal 1 and the splice pack harness connector's serial data input terminal.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
11. Replace the splice pack.

Circuit/System Testing

Testing the Serial Data Circuits for a Short to Voltage

1. Vehicle OFF, disconnect the appropriate harness connectors at all low speed GMLAN serial data splice packs, Vehicle in Service Mode.
2. Test for less than 4.5 V between the serial data circuit terminal 1 at the X84 Data Link Connector and ground.
    - **If 4.5 V or greater**

      Repair the short to voltage on the serial data circuit.

    - **If less than 4.5 V**
3. Test for less than 4.5 V between each low speed GMLAN serial data circuit at a splice pack and ground.
    - **If any serial data circuit is greater than 4.5 V**
    1. Vehicle OFF, disconnect all devices on the failed serial data circuit, Vehicle in Service Mode.
    2. Test for less than 1 V between each section of the failed serial data circuit and ground.
        - If 1 V or greater, repair the short to voltage in the circuit.

        - If less than 1 V
    3. Vehicle OFF, connect the splice pack and connect the first device on the failed serial data circuit, Vehicle in Service Mode.
    4. Verify the scan tool communicates or not with the low speed GMLAN serial data circuit.
        - If the scan tool does not communicate, replace the device that was just connected.
        - If the scan tool communicates and there are more devices to connect, connect the next device and repeat step 3.4.
        - If the scan tool communicates and there are no more devices to connect
    5. All OK.
    - **If all serial data circuits are less than 4.5 V**
4. All OK.

Testing the Serial Data Circuits for a Short to Ground

1. Vehicle OFF, all access doors closed, all vehicle systems OFF, all keys at least 3 m (9.8 ft) away from vehicle. It may take up to 2 min for all vehicle systems to power down. Disconnect the appropriate harness connectors at all low speed GMLAN serial data splice packs.
2. Test for infinite resistance between the serial data circuit terminal 1 at the X84 Data Link Connector and ground.
    - **If less than infinite resistance**

      Repair the short to ground on the serial data circuit.

    - **If infinite resistance**
3. Test for greater than 100 Ω between each low speed GMLAN serial data circuit at a splice pack and ground.
    - **If any serial data circuit is 100 Ω or less**
    1. Disconnect all devices on the failed serial data circuit.
    2. Test for infinite resistance between each section of the failed serial data circuit and ground.
        - If less than infinite resistance, repair the short to ground in the circuit.
        - If infinite resistance
    3. Connect the splice pack and connect the first device on the failed serial data circuit, Vehicle in Service Mode.
    4. Verify the scan tool communicates or not with the low speed GMLAN serial data circuit.
        - If the scan tool does not communicate, replace the device that was just connected.
        - If the scan tool communicates and there are more devices to connect, connect the next device and repeat step 3.4.
        - If the scan tool communicates and there are no more devices to connect
    5. All OK.
    - **If all serial data circuits are greater than 100 Ω**
4. All OK.

Testing the Serial Data Circuit for an Open/High Resistance

1. Vehicle OFF and all vehicle systems OFF, disconnect the splice pack containing the devices that are not communicating on the low speed GMLAN serial data circuit.
2. Test for less than 2 Ω between the X84 Data Link Connector terminal 1 and the disconnected splice pack.
    - **If 2 Ω or greater**

      Repair the open/high resistance in the serial data circuit.

    - **If less than 2 Ω**
3. Disconnect all devices on the failed serial data circuit.
4. Test for less than 2 Ω between each section of the failed serial data circuit end to end.

- **If 2 Ω or greater**

  Repair the open/high resistance in the serial data circuit.

- **If less than 2 Ω**

5. Connect the splice pack and connect the first device on the failed serial data circuit, Vehicle in Service Mode.
6. Verify if the device communicates or not with the scan tool.
   - **If the device does not communicates**

     Replace the device.

   - **If the device communicates and there are more devices to connect**

     Connect the next device on the failed serial data circuit and repeat step 6.

   - **If all devices are connected and communicating**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Serial Data Circuit Wiring Repairs**
- **Control Module References** for device replacement, programming and setup

DATA LINK REFERENCES

This table identifies which serial data link that a particular module uses for in-vehicle data transmission. Some modules may use more than one data link to communicate. Some modules may have multiple communication circuits passing through them without actively communicating on that data link. This table is used to assist in correcting a communication malfunction. For the description and operation of these serial data communication circuits refer to **Data Link Communications Description and Operation** .

REPAIR INSTRUCTIONS

BODY CONTROL MODULE REPLACEMENT

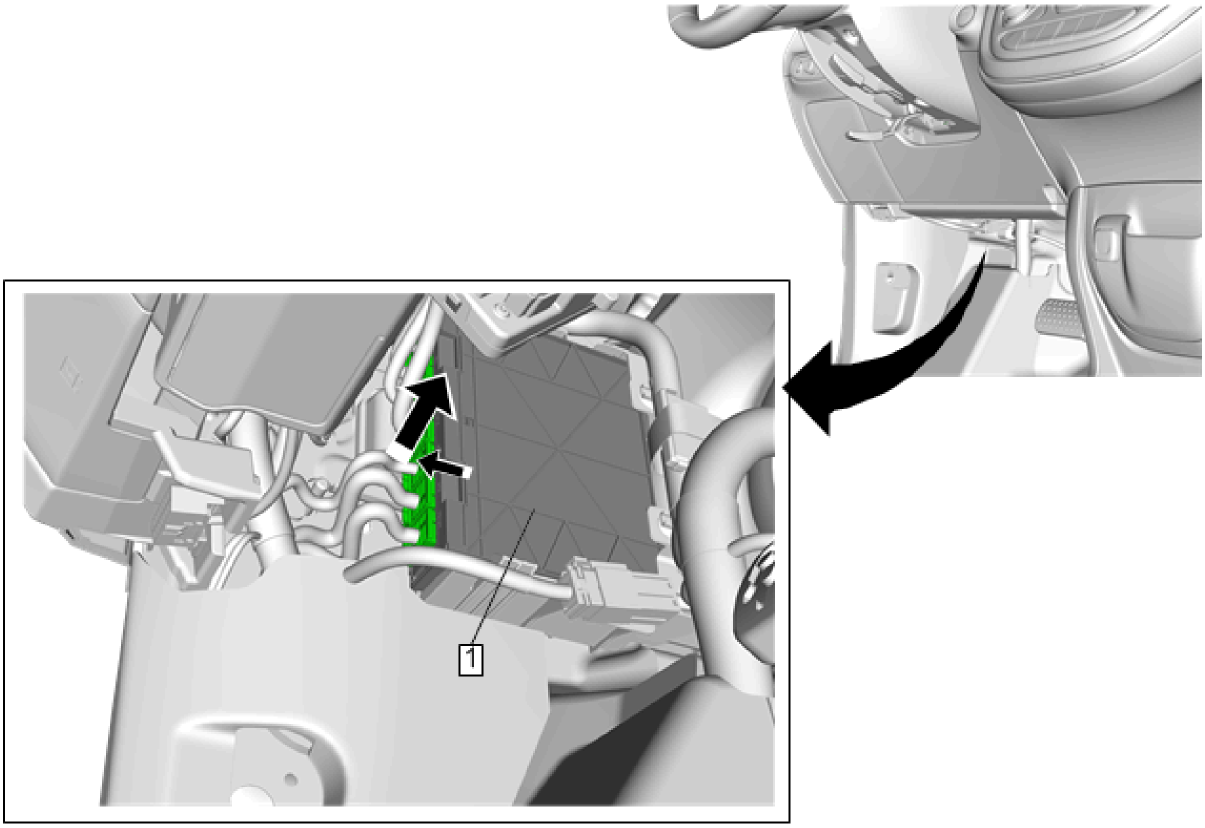

Fig. 1: Body Control Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Body Control Module **Procedure** 1. While pushing the retaining tab, slightly slide the module rearward. 2. Push the (Qty: 2) retaining tabs and pull the module out from its bracket. 3. Disconnect the electrical connectors. 4. Refer to Control Module References for programming and set up information, if required.

BODY CONTROL MODULE BRACKET REPLACEMENT

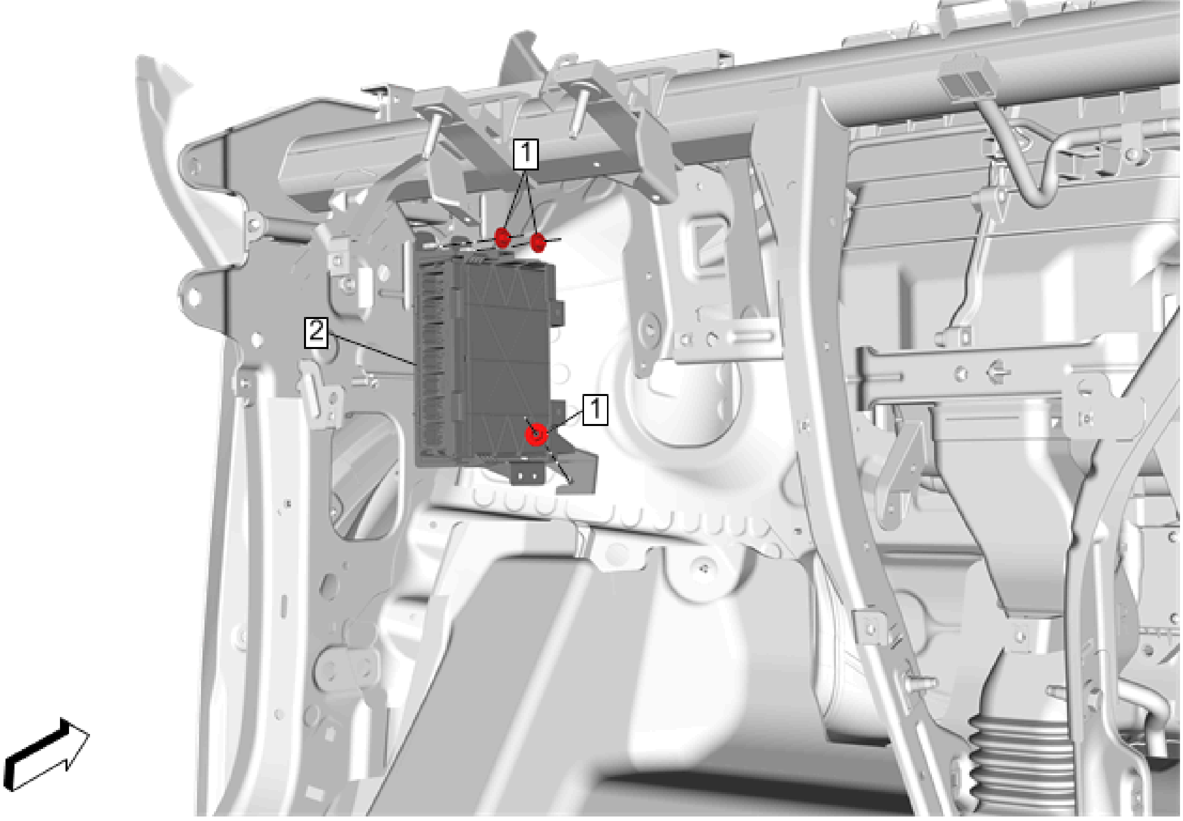

Fig. 2: Body Control Module Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Disconnect the battery negative cable. **Battery Negative Cable Disconnection and Connection** 2. **Steering Column Replacement**	
1	Body Control Module Bracket Nut **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)
2	Body Control Module Bracket **Procedure** 1. Unclip the body harness from the bracket. 2. Transfer components as necessary. 3. Connect the battery negative cable. **Battery Negative Cable Disconnection and Connection**

HYBRID POWERTRAIN CONTROL MODULE 2 REPLACEMENT

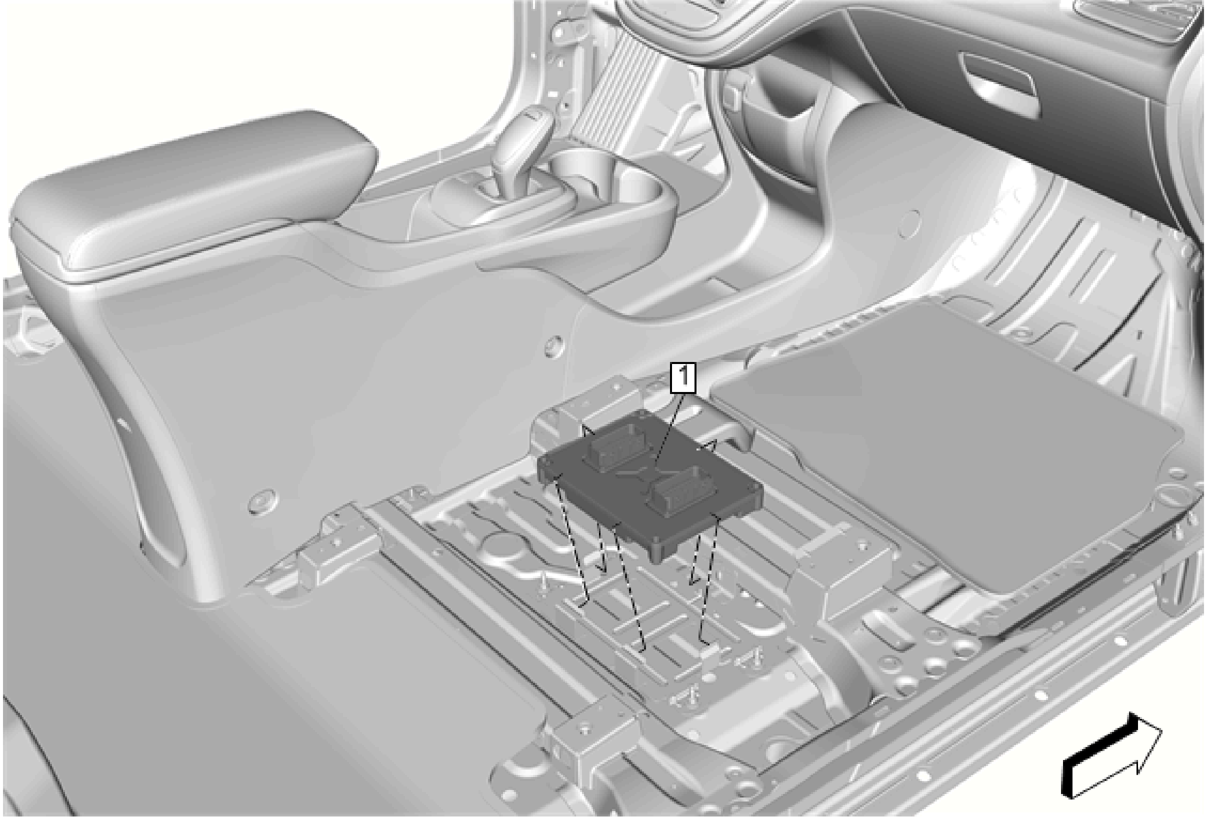

Fig. 3: Hybrid Powertrain Control Module 2
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures **WARNING:** **Refer to Battery Disconnect Warning .** 1. Disconnect the battery negative cable. 2. Move the passenger seat fully backward. 3. Raise the seat fully upward.	
1	Hybrid Powertrain Control Module 2 **Procedure** 1. To access the module, open up the floor carpet along the cut line. 2. Disconnect the electrical connectors. 3. Release tabs on bracket to remove module. 4. For programming and set up, refer to Control Module References . 5. Fully charge the Hybrid Battery following all programming.

SERIAL DATA GATEWAY MODULE REPLACEMENT

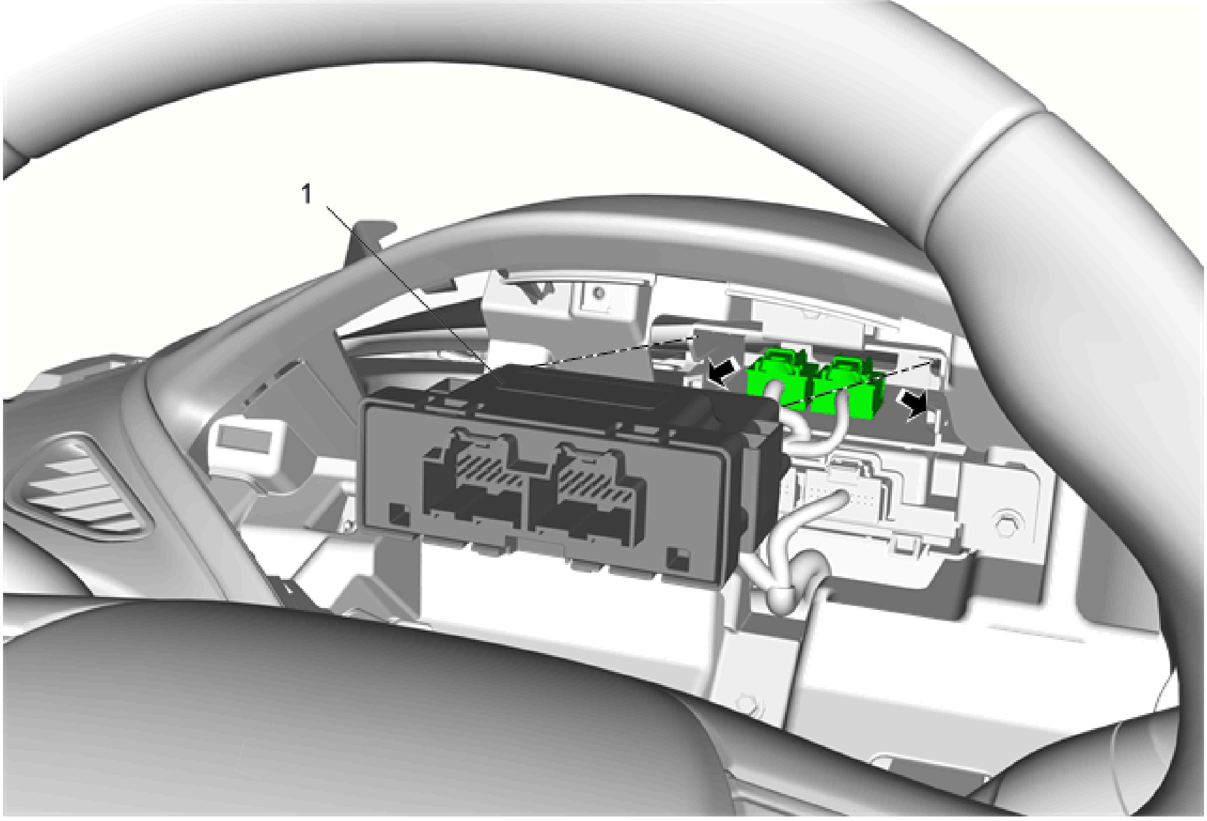

Fig. 4: Serial Data Gateway Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Instrument Cluster Replacement	
1	Serial Data Gateway Module **Procedure** 1. Disconnect the electrical connectors. 2. Release the retaining tab. 3. Perform the necessary programming and setup procedure:Control Module References

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B0550: ODOMETER CIRCUIT GENERAL MEMORY MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B0550 32

Odometer Circuit General Memory Malfunction

Circuit/System Description

The instrument cluster is equipped with odometers that indicate the distance traveled by the vehicle. One type of odometer is the season odometer where the traveled distance can not be reset by the driver. This information is also stored in the body control module (BCM). In addition to storing the season odometer value for the vehicle, the instrument cluster and the BCM store the VIN. Software checks are performed to ensure these modules, and their stored season odometer information, can not be moved or transferred between different vehicles.

Conditions for Running the DTC

The vehicle is ON.

Conditions for Setting the DTC

The BCM has detected an internal memory malfunction.

Action Taken When the DTC Sets

DTC B0550 32 is stored in the BCM memory.

Conditions for Clearing the DTC

The BCM no longer detects a malfunction.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify DTC B0550 32 is not set.
    - **If DTC B0550 32 is set**
    1. Program the K9 Body Control Module.
    2. Verify the DTC does not set.
        - If the DTC sets, replace the K9 Body Control Module
        - If the DTC does not set
    3. All OK.
    - **If DTC B0550 32 is not set**
3. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC B071F: TRANSMISSION RANGE INDICATOR INTERNAL MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B071F 39

Transmission Range Indicator Internal Malfunction

Circuit/System Description

The transmission shift lever position indicator is located on the center console and indicates the current transmission shift lever position. The transmission shift lever position indicator receives power and ground and is controlled by the body control module (BCM) via serial data.

Conditions for Running the DTC

The ignition is ON.

Conditions for Setting the DTC

The BCM has detected an internal malfunction in the transmission shift lever position indicator.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

The DTC will become history if the BCM no longer detects a malfunction.

Ambient Air Temperature Sensor Performance

DTC P0072

Ambient Air Temperature Sensor Circuit Low Voltage

DTC P0073

Ambient Air Temperature Sensor Circuit High Voltage

DTC P0074

Ambient Air Temperature Sensor Circuit Intermittent

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Signal	P0072	P0073	P0073	P0071, P0074

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Low Reference	-	P0073	-	P0071, P0074

Circuit/System Description

The ambient air temperature sensor is located behind the grille. The Hybrid/EV Powertrain Control Module 2 monitors the ambient air temperature sensor utilizing a low reference circuit and signal circuit. The Hybrid/EV Powertrain Control Module 2 monitors the voltage drop across the sensor, which is inversely proportional to temperature. When the ambient air temperature is cold, the resistance of the sensor is high. When the ambient air temperature is warm, the resistance of the sensor is low. The Hybrid/EV Powertrain Control Module 2 converts the voltage value to a temperature value. The Hybrid/EV Powertrain Control Module 2 also sends the temperature value to other control modules via serial data.

Conditions for Running the DTC

- Ignition ON/Vehicle in Service Mode
- The 12 V battery voltage is greater than or equal to 10.2 V.

Conditions for Setting the DTC

P0071

During the first 20 s of run time after the 1 hour soaking period, the difference between the outside air temperature and the A/C High Pressure Switch Signal is greater than 30Â°C (86Â°F).

P0072

The Hybrid/EV Powertrain Control Module 2 detects the sensor signal is more than 60Â°C (140Â°F).

P0073

The Hybrid/EV Powertrain Control Module 2 detects the sensor signal is less than -40Â°C (-40Â°F).

P0074

The Hybrid/EV Powertrain Control Module 2 detects an unrealistic signal variance.

Action Taken When the DTC Sets

- DTC P0071 - P0074 are type B DTCs.

Conditions for Clearing the DTC

The DTC will become history if the ECM no longer detects a malfunction.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Hybrid/EV Powertrain Control Module 2 Ambient Air Temperature parameter is between -40Â°C (-40Â°F) and + 60Â°C (+140Â°F) and changes with air temperature changes.
   - **If not between -40Â°C (-40Â°F) and +60Â°C (+140Â°F) or changes with air temperature changes**

     Refer to Circuit/System Testing.

   - **If between -40Â°C (-40Â°F) and +60Â°C (+140Â°F) and changes with air temperature changes**
3. All OK.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B9 Ambient Air Temperature Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal B (or 2) and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the Hybrid/EV Powertrain Control Module 2 scan tool Ambient Air Temperature parameter is less than -39Â°C (-38Â°F).
   - **If -39Â°C (-38Â°F) or greater**
   1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
   2. Test for infinite resistance between the signal circuit terminal A (or 1) and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
   - **If less than -39Â°C (-38Â°F)**
5. Install a 3 A fused jumper wire between the signal circuit terminal A (or 1) and the low reference circuit terminal B (or 2).
6. Verify the Hybrid/EV Powertrain Control Module 2 scan tool Ambient Air Temperature parameter is 57Â°C (+135Â°F) or greater.
   - **If less than 57Â°C (+135Â°F)**

    1. Vehicle OFF, remove the jumper wire and disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Vehicle OFF.
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
- **If 57Â°C (135Â°F) or greater**

7. Test or replace the B9 Ambient Air Temperature Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Ambient Air Temperature Sensor Replacement**
- **Control Module References** for control module replacement, programming and setup

DISPLAYS AND GAUGES COMPONENT REPLACEMENT REFERENCE

Component	Repair Instruction
B9 Ambient Air Temperature Sensor	**Ambient Air Temperature Sensor Replacement**

S16 Driver Information Center Switch	**Turn Signal Switch Replacement**

SYMPTOMS - DISPLAYS AND GAUGES

NOTE: **The following steps must be completed before using the symptom diagnostic tables.**

1. Before using the symptom diagnostic tables, perform the **Diagnostic System Check - Vehicle** .
2. Review the system operation in order to understand the system functions. Refer to the following description and operations:
    - **Instrument Cluster Description and Operation**
    - **Indicator/Warning Message Description and Operation**
    - **Driver Information Center (DIC) Description and Operation**
    - **Audible Warnings Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which can affect the operation of the instrument panel cluster or the audible warning systems. Refer to **Checking Aftermarket Accessories** .
- Inspect the accessible system components or the visible system components for obvious damage or for obvious conditions which can cause the symptom.
- Inspect for the proper fluid levels.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

Gauges and Odometer

- **Instrument Cluster Display Malfunction**
- **Speedometer and/or Odometer Malfunction**

Audible Warnings

Chime Malfunction

CHIME MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The radio generates the audible warnings. The instrument cluster, the body control module (BCM), the inflatable restraint sensing and diagnostic module (SDM) or the object alarm module request audible warnings via Low Speed CAN-Bus signals.

Control Module References for scan tool information

Circuit/System Verification

NOTE: **Before performing this diagnostics, make sure no indicators are illuminated after the instrument cluster performs a lamp test. If any indicators are illuminated after the bulb test, perform the indicator diagnostics before this diagnostics.**

1. Vehicle in Service Mode.
2. Verify all the radio speakers operate by adjust the radio balance and fade to each speaker.
    - **If any speaker does not operate properly**

      Refer to **Speaker Malfunction (UQA)** **Speaker Malfunction (without UQA)** .

    - **If the speakers operate properly**
3. Verify the scan tool Driver Seat Belt Status and Passenger Seat Belt Status parameters are Buckled when both front seat belts are buckled.

- **If not Buckled**

  Refer to **Seat Belt Indicator Malfunction - Driver** .

- **If buckled**

4. Verify the scan tool Headlamp On Switch parameter is Inactive when the headlamps are OFF.
   - **If not Inactive**

     Refer to **Headlamps Malfunction** .

   - **If Inactive**
5. Verify the scan tool Park Lamps Switch parameter is Inactive when the park lamp switch is OFF.
   - **If not Inactive**

     Refer to **Park, License, and/or Tail Lamps Malfunction (MBM)** **Park, License, and/or Tail Lamps Malfunction (MAH/MBC/MAW/MCX)** .

   - **If Inactive**
6. Verify the scan tool Left Turn Signal Switch and Right Turn Signal Switch parameters are Inactive while the turn signal switch is OFF.
   - **If not Inactive**

     Refer to **Turn Signal Lamps and/or Indicators Malfunction** .

   - **If Inactive**
7. Verify the scan tool Park Brake Switch parameter is Inactive when the park brake is OFF.
   - **If not Inactive**

     Refer to **Park Brake System Diagnosis** .

   - **If Inactive**
8. Verify that all scan tool parameters listed below are Inactive when all the doors are closed.
   - Driver Door Ajar Switch
   - Passenger Door Ajar Switch
   - Left Rear Door Ajar Switch
   - Right Rear Door Ajar Switch
   - **If not Inactive**

     Refer to **Door Ajar Indicator Malfunction** .

   - **If Inactive**
9. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

INSTRUMENT CLUSTER DISPLAY MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The instrument cluster is a multifunction module that provides the vehicle operator with information using an interactive LCD display. Because the instrument cluster is an LCD display, driver information center elements are located in various zones of the display, depending on how the display l is configured. The instrument cluster displays vehicle information based on the information received via seral data from other modules.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Hybrid/EV Powertrain Control Module 2 Ambient Air Temperature parameter is between -40Â°C (-40Â°F) and + 60Â°C (+140Â°F) and changes with air temperature changes.
    - **If not between -40Â°C (-40Â°F) and +60Â°C (+140Â°F) or changes with air temperature changes**

      Refer to Circuit/System Testing.

    - **If between -40Â°C (-40Â°F) and +60Â°C (+140Â°F) and changes with air temperature changes**
3. All OK.

Circuit/System Testing

NOTE: **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the B9 Ambient Air Temperature Sensor. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the low reference circuit terminal B (or 2) and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for less than 2 Ω in the low reference circuit end to end.

        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the Hybrid/EV Powertrain Control Module 2 scan tool Ambient Air Temperature parameter is less than -39Â°C (-38Â°F).
    - **If -39Â°C (-38Â°F) or greater**
    1. Vehicle OFF, disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2.
    2. Test for infinite resistance between the signal circuit terminal A (or 1) and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If less than -39Â°C (-38Â°F)**
5. Install a 3 A fused jumper wire between the signal circuit terminal A (or 1) and the low reference circuit terminal B (or 2).
6. Verify the Hybrid/EV Powertrain Control Module 2 scan tool Ambient Air Temperature parameter is 57Â°C (+135Â°F) or greater.
    - **If less than 57Â°C (+135Â°F)**
    1. Vehicle OFF, remove the jumper wire and disconnect the X1 harness connector at the K114B Hybrid/EV Powertrain Control Module 2, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Vehicle OFF.
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K114B Hybrid/EV Powertrain Control Module 2.
    - **If 57Â°C (135Â°F) or greater**
7. Test or replace the B9 Ambient Air Temperature Sensor.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Ambient Air Temperature Sensor Replacement**
- **Control Module References** for control module replacement, programming and setup

SPEEDOMETER AND/OR ODOMETER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

The instrument cluster displays the engine coolant temperature, fuel level, vehicle speed and the engine speed based on the information from the engine control module (ECM). The ECM sends information via serial data to the body control module (BCM). The BCM then sends the information via serial data to the instrument cluster to display the engine coolant temperature, fuel level, the engine speed, the vehicle speed and the distance travelled, either in kilometers or miles, based on the vehicle requirements. The instrument cluster will display dashes when its VIN does not match the VIN received from the BCM.

Diagnostic Aids

If the VIN mismatch is corrected the odometer will once again be displayed in the instrument cluster. If the vehicle is driven for a calibrated distance with a VIN mismatch, it will cause the instrument cluster odometer to enter into an error mode and lock itself. When this occurs the dashes will remain on the display even after correcting the VIN mismatch. The vehicle odometer status data display on the scan tool can be used to identify a locked odometer. The only way to unlock the instrument cluster (clear the dashes from the display) is to perform an SPS programming event. Failure to follow the diagnostic and programming procedures may result in either an improper odometer value or a module replacement.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify all gauge segments illuminate when performing the Driver Information Center Segments test with the scan tool.
    - **If any gauge segments do not illuminate**

      Replace the P16 instrument cluster

    - **If all gauge segments illuminate**
3. Drive the vehicle.
4. Verify the displayed Instrument Cluster speedometer value matches the vehicle speed parameter on the scan tool.
    - **If the values do not match**

      Replace the P16 Instrument Cluster.

    - **If the values match**
5. Verify the odometer display and the displayed distance counts up while driving the vehicle.
    - **If the odometer displays only "----" (dashes)**

      Refer to Circuit/System Testing.

    - **If the odometer display does not count up**

      Replace the P16 Instrument Cluster.

    - **If speedometer sweeps and displays the correct value, and the odometer display counts up**

6. All OK.

Circuit/System Testing

NOTE:

- **Circuit/System Verification must be performed before proceeding with Circuit/System Testing.**
- **If there are multiple modules not original to the vehicle and are not new correctly configured service parts, SPS may not be able to proper read or recover the vehicle odometer value. Follow government rules and documentation (including vehicle identification) regarding inaccurate/unknown odometer values.**

Correcting VIN mismatch: Instrument Cluster is Showing "----" (Dashes) odometer is still unlocked

1. Verify the scan tool Odometer Status parameter is Unlocked.
   - **If the reading is Locked**

     Refer to correcting VIN mismatch - odometer locked.

   - **If the reading is Unlocked**
2. Verify the scan tool BCM VIN parameter matches the vehicle's VIN placard.
   - **If the VIN does not match**

     Reprogram the BCM, then proceed to Step 3.

   - **If the VIN matches**
3. Verify the scan tool Instrument Cluster VIN parameter matches the vehicle's VIN placard.
   - **If the VIN does not match**

     Reprogram the instrument cluster. Then proceed with step 4.

   - **If the VIN matches**
4. Vehicle in Service Mode.
5. Verify the instrument cluster is displaying the correct value.
   - **If the instrument cluster is still displaying "----" (dashes)**

     Replace the P16 Instrument Cluster.

   - **If the instrument cluster displays the correct value**
6. All OK.

Correcting VIN mismatch: Instrument Cluster is Showing "----" (Dashes) odometer is locked

1. Verify the scan tool Odometer Status parameter is Locked.
   - **If the reading is Unlocked**

     Refer to Correcting VIN mismatch - odometer unlocked.

   - **If the reading is Locked**
2. Verify the scan tool Instrument Cluster VIN parameter matches the vehicle's VIN placard.
   - **If the VIN does not match**

     Reprogram the Instrument Cluster. Then proceed with step 3.

   - **If the VIN matches**
3. Perform the BCM setup procedure in SPS.
4. Vehicle in Service Mode.

5. Verify the instrument cluster is displaying the correct value.
    - **If the instrument cluster is still displaying "----" (dashes)**

      Replace the P16 Instrument Cluster.

    - **If instrument cluster is displaying the correct value**
6. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Control Module References for control module replacement, programming and setup

REPAIR INSTRUCTIONS

AMBIENT AIR TEMPERATURE SENSOR REPLACEMENT

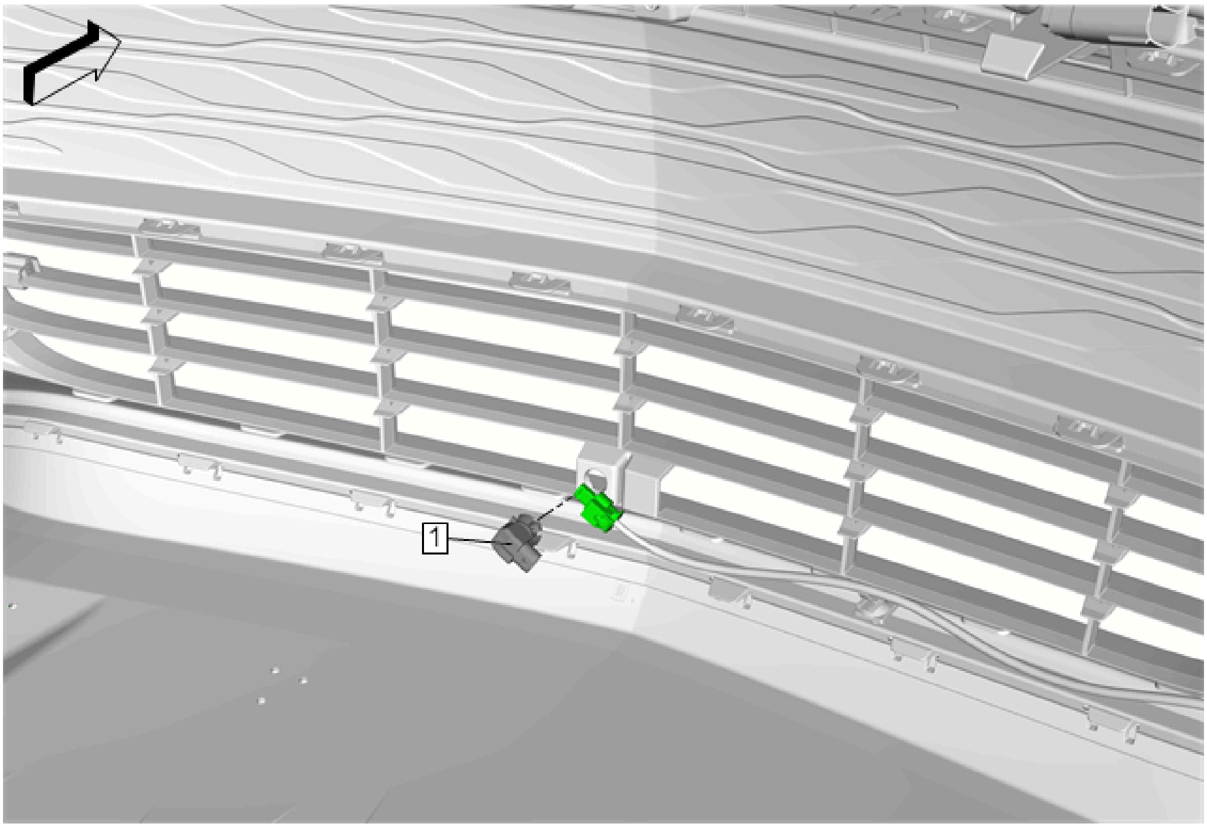

Fig. 5: Ambient Air Temperature Sensor
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea)	
1	Ambient Air Temperature Gauge Sensor **Procedure** 1. Disconnect the electrical connectors. 2. Unlock the retaining tabs.

INSTRUMENT CLUSTER REPLACEMENT

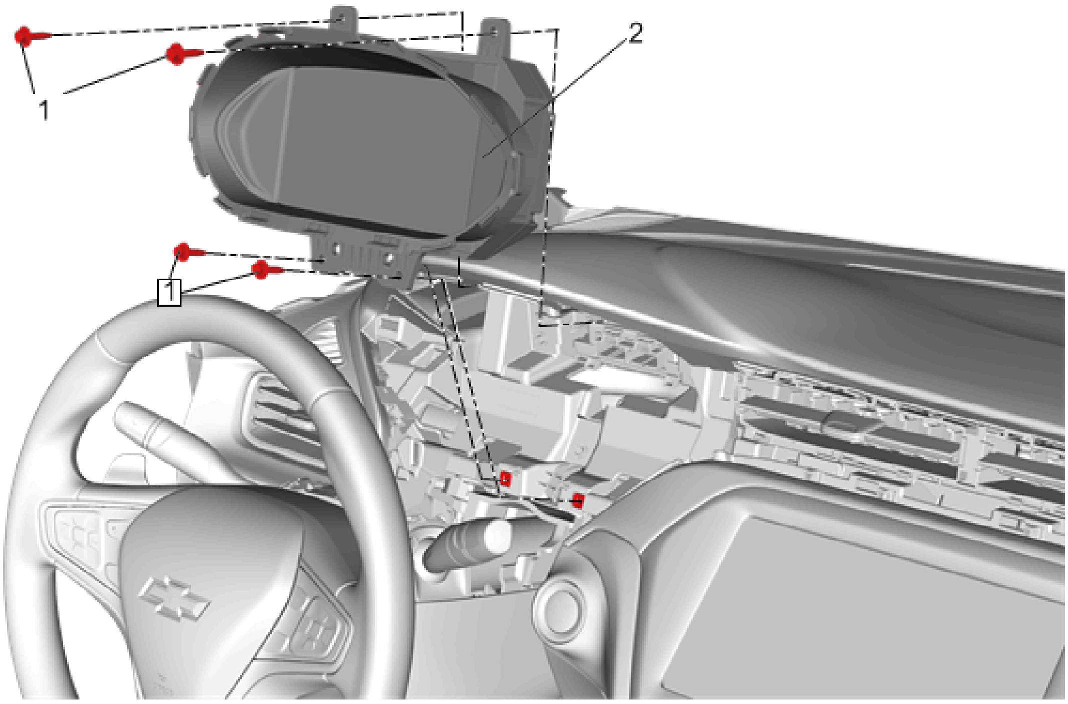

Fig. 6: Instrument Cluster
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Steering Column Upper Trim Cover Replacement	
1	Instrument Cluster Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Instrument Cluster **Procedure** 1. Disconnect the electrical connector. 2. Refer to Control Module References for programming and set up information, if required.

DESCRIPTION AND OPERATION

AUDIBLE WARNINGS DESCRIPTION AND OPERATION

The audible warnings alert the driver of a system concern or a critical vehicle condition. The radio generates the audible warnings through the speakers. The radio receives audible warning requests via the serial data circuit. If the radio receives multiple audible warning requests, the warning with the highest priority sounds first. On vehicles without a radio, a chime module generates the audible warnings and receives audible warning requests via the serial data circuit. Either the radio or the chime module is the chime producer. The following lists the audible warning sounds:

1. Single pulse gong
2. Multiple pulse gong
3. Single pulse beep

4. Multiple pulse beep
5. Click
6. Clack

Auto Stop Mode

The chime producer activates when the vehicle comes to a stop and the driver or passenger door is opened as requested by the body control module.

Fasten Safety Belt Warning

The chime producer activates the fasten safety belt audible warning as requested by the body control module (BCM). The BCM sends a serial data message to the chime producer indicating the chime as a multiple gong. The fasten safety belt warning sounds and the fasten safety belt indicator illuminates when the following occurs:

- The ignition switch transitions to ON.
- The inflatable restraint sensing and diagnostic module (SDM) detects that the drivers seat belt is not buckled and the signal is low. The SDM sends a serial data message to the BCM indicating the seat belt status. The instrument cluster receives a serial data message from the BCM indicating the driver seat belt status.

If the seat belt is buckled when the ignition is turned ON, the chime does not sound. If the seat belt is buckled while the chime is sounding, the chime stops. If the seat belt is unbuckled after the initial transition to ON, the chime does not sound.

Lights On Warning

The chime producer activates the lights on warning as requested by the BCM. The BCM sends a serial data message to the chime producer indicating the chime as a multiple gong. The lights on warning sounds when the following occurs:

- The ignition is OFF.
- The BCM determines that the driver door is open and the signal circuit is low.
- The BCM determines that the headlamp switch is in the park or head position.

Brake Warning

The chime producer activates the brake audible warning as requested by multiple control modules. The BCM, electronic brake control module or the parking brake control module sends a serial data message to the chime producer indicating the chime as a multiple gong. The brake warning sounds and the BRAKE indicator illuminates when the following occurs:

- The ignition is ON.
- The vehicle speed is greater than 8 km/h (4.9 mph). The instrument cluster receives a serial data message from the engine control module (ECM) indicating the vehicle speed.
- The BCM determines that the parking brake is engaged and the signal circuit is low.
- The brake fluid is low.

Door Ajar Warning

The chime producer activates the door ajar audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer indicating the chime frequency of a medium rate and continuous duration. The door ajar warning sounds and the appropriate door ajar indicator illuminates in the driver information center when the following occurs:

- The BCM determines that a door (driver door, passenger door, left rear door, right rear door) is open and the signal circuit is low. The instrument cluster also receives a serial data message from the BCM indicating the door ajar status.
- The vehicle is not in PARK. The BCM receives a serial data message from the ECM/BCM indicating the gear position.

Object Detection

The chime producer activates the object detection audible warning as requested by the object alarm module. When an object is within the measuring range of the sensor, the ultrasonic pulse is reflected and is received by the sending or a neighboring sensor. The sensor converts this signal into a voltage signal and sends this signal to the object alarm module. The object alarm module evaluates the received sensor signals. As soon as an object is within the measuring range, the object alarm module sends a message via CAN-Bus to the chime producer in order to give out the acoustic distance signal. The measuring range is between 30 - 120 cm (11.81 - 47.24 in). From a distance of 120 cm (47.24 in), the acoustic signal is active. The frequency of the beep sound increases with decreasing distance. From a distance less than 30 cm (11.81 in), the sound becomes continuous.

Additional Warnings

The following warnings have an associated instrument cluster indicator or driver information center message:

- Turn Signal Indicators - The chime producer activates the audible warning as requested by the BCM. The chime produces two different chimes, one when the turn signal turns off and another when the turn signal turns on.
- Vehicle Overspeed Message - The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Fuel Level Low Message - The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Oil Pressure Indicator - The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Park Assist Fault Clean Rear Bumper Message - The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.
- Tire Pressure Low Indicator - The chime producer activates the audible warning as requested by the BCM. The BCM sends a serial data message to the chime producer.

Refer to **Indicator/Warning Message Description and Operation**.

DRIVER INFORMATION CENTER (DIC) DESCRIPTION AND OPERATION

The Driver Information Center display is in the instrument cluster. The Driver Information Center displays information about the vehicle. It also displays warning messages if a system problem is detected. For more information on Indicators and Warning messages, refer to **Indicator/Warning Message Description and Operation**.

There are 3 switch functions for the driver information center:

- CONFIG: Press to select either the Simple or Enhanced instrument cluster configuration display.
- BACK: Press to return to the previous screen, exit a screen, or return to the main menu. Press BACK to minimize the DIC menu display.
- SELECT: Press the center of the knob to select the highlighted item. Turn the knob to scroll through the menu items.

Menu

Turn the SELECT knob to scroll through the possible menus. Press the center of the SELECT knob when a menu is highlighted to enter that menu. The possible Driver Information Center menu's are:

- Trip A
- Trip B
- Tire Pressure
- Vehicle Messages
- Units
- Tutorial Mode

Trip A and Trip B

The trip displays show fuel used and distance traveled since the last trip reset.

Reset the trip data by pressing and holding the SELECT button when either Trip A or Trip B is displayed.

Outside Air Temperature

The outside air temperature can be accessed through the driver information center Trip/Fuel switch function. The driver information center shows the outside air temperature as a damped value. The time and rate of the temperature update is based on an algorithm in the instrument cluster. Factors such as last temperature reading, current temperature reading, length of time the vehicle was off, current vehicle speed, and the distance driven effect when the displayed temperature is updated. To get the vehicle to display the most accurate temperature faster, drive the vehicle. Constant moving traffic will update the display to the correct temperature more quickly than stop and go traffic.

Tire Pressure

The display will show a vehicle with the approximate pressures of all four tires. Tire pressure is displayed in either kilopascal (kPa) or in pounds per square inch (psi).

If a low or high tire pressure is detected, a message is displayed advising to check the tire pressure in the specified tire.

Vehicle Messages

Turn the SELECT knob to scroll through any active warning messages. Press SELECT to review the messages.

Units

Turn the SELECT knob to change the unit display to METRIC or US when the display is active. Press SELECT to confirm the setting. This will change the displays on the cluster and DIC to either metric or English (US) measurements.

Tutorial Mode

Select this menu item to view a screen that explains some of the unique features of the cluster.

Language

The driver information center is capable of displaying in different languages, corresponding to the radio language settings. The instrument cluster receives a GMLAN message with language information from the radio. This message is only sent one time, after a new language is selected. To set the language, see the owners manual.

INDICATOR/WARNING MESSAGE DESCRIPTION AND OPERATION

Indicator LIGHT ON

Refer to the owner's manual for the descriptions and explanations of all indicator lights.

For diagnosis and repair information related to an indicator light, refer to the System Diagnosis and the Description of Operation that the message relates to.

Message Displayed

Refer to the owner's manual for descriptions and explanations of all messages displayed.

For diagnosis and repair information related to a displayed message, refer to the System Diagnosis and the Description of Operation that the message relates to.

Transmission Shift Lever Position Indicator

The Transmission Shift Lever Position Indicator (if equipped) is located on the center console and indicates the current transmission shift lever position. The Transmission Shift Lever Position Indicator receives power and ground and is controlled by the Body Control Module (BCM) via serial data. The Transmission Control Module determines transmission shift lever position based on signals from the Transmission Internal Mode Switch and sends the shift lever position information to the BCM via serial data.

INSTRUMENT CLUSTER DESCRIPTION AND OPERATION

Displays Test

The instrument cluster displays a preview of information that includes electric range, charging, odometer, and battery status. This happens when the driver door is first opened, and following the welcome animation before starting the vehicle.

A CHARGING OVERRIDE/INTERRUPTION OCCURRED message may display on the lower left of the screen to indicate that a charging override or interruption has occurred due to:

- Override of charging settings by vehicle owner via OnStar.
- Unintended interruption of AC power at the vehicle's charge port.
- Interruption of charging by the utility company via OnStar as authorized by vehicle owner.

Refer to the owners manual for a complete list of vehicle charging status screen messages.

Indicators and Warning Messages

Refer to **Indicator/Warning Message Description and Operation**.

Battery and Driver Efficiency Gauges

Refer to the owner's manual for descriptions and explanations of Battery and Driver Efficiency Gauges.

Speedometer

The instrument cluster displays the vehicle speed based on the information from the ECM. The ECM sends the vehicle speed information via a High Speed CAN-Bus signal to the BCM. The BCM then sends the vehicle speed information via a Low Speed CAN-Bus signal to the instrument cluster in order to display the vehicle speed, either in kilometers or miles, based on the vehicle requirements. The speedometer defaults to 0 km/h (0 MPH) if:

- The BCM detects a loss of serial data communications with the ECM.
- The instrument cluster detects a loss of serial data communications with the BCM.

Odometer

The instrument cluster displays the vehicle odometer in the driver information center. The ECM send a distance rolling count message on GMLAN to the body control module (BCM). The BCM uses this information to calculate the vehicle odometer. This odometer value is then sent to the instrument cluster on GMLAN. The instrument cluster does not calculate the odometer. The odometer displays miles or kilometers as selected in the Units menu.

The odometer value is stored in multiple modules. The instrument cluster is a secondary storage module for the odometer, while the BCM is the primary storage and accumulator.

In addition to storing the odometer value for the vehicle, the instrument cluster and the BCM store the VIN. Software checks are performed to ensure these modules, and their stored odometer information, can not be move or transferred between different vehicles.

If the VINs do not match, the instrument cluster will go into an error mode and display "----" (dashes). If the VIN mismatch exists over a calibrated distance, the instrument cluster will "lock" the odometer display and only show dashes, even if the VIN mismatch is subsequently correct. The only way to clear or "unlock" the instrument cluster is to perform a BCM programming event using SPS.

Compass

The vehicle may have a compass display on the Driver Information Center. The compass receives its heading and other information from the Global Positioning System (GPS) antenna. If applicable, the GPS antenna is located with the telematics communication interface control module.

Driver Information Center Display

In the lower middle of the instrument cluster, an additional display is installed. Its task is to give additional information, such as an odometer or error codes. This part of the instrument cluster is available in 4 different variants, mostly depending on the assembled configuration. For further information refer to **Driver Information Center (DIC) Description and Operation**.

REPAIR INSTRUCTIONS

FRONT FENDER EMBLEM/NAMEPLATE REPLACEMENT

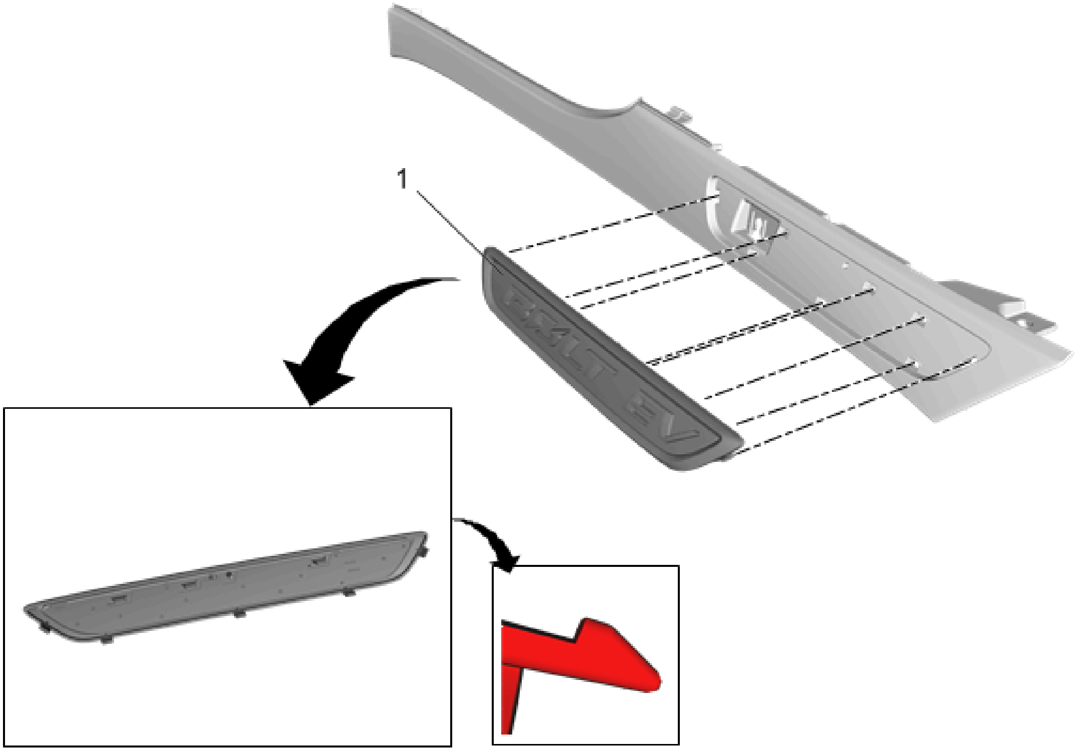

Fig. 1: Front Fender Emblem/Nameplate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Front Fender Upper Rear Molding Replacement	
1	Front Fender Emblem/Nameplate **CAUTION:** **Use a plastic, flat-bladed tool to prevent paint damage when removing an emblem/name plate.** **CAUTION:** **Anytime the emblem/nameplate is removed from the vehicle, it MUST BE REPLACED. The locking tabs that secure the emblem/nameplate to the vehicle WILL BE DAMAGED when the emblem name/plate is removed, and under no circumstances may the emblem/nameplate be re-used.** **Procedure** 1. Using a suitable flat bladed tool release the eight locking tabs and pull the emblem from the molding. 2. The part and surface should be 21Â°C (70Â°F) prior to installation. The vehicle should remain 21Â°C (70Â°F) for one hour after assembly to allow adhesive to develop sufficient bond strength. 3. Use a heat gun or equivalent to remove the liftgate emblem. Use a plastic flat bladed tool to assist in removal. 4. Clean any remaining residue with a 50/50 mixture by volume of isopropyl alcohol and clean drinkable water. Wipe surface dry with a clean lint-free towel. 5. When removing protective liners from the adhesive tape, be careful not to touch tape with hands and do not allow tape to come in contact with dirt or any foreign matter prior to adhesion. 6. Using the palm of the hand, wet out the liftgate emblem to ensure full adhesion is made.

LIFTGATE EMBLEM/NAMEPLATE REPLACEMENT (EMBLEM)

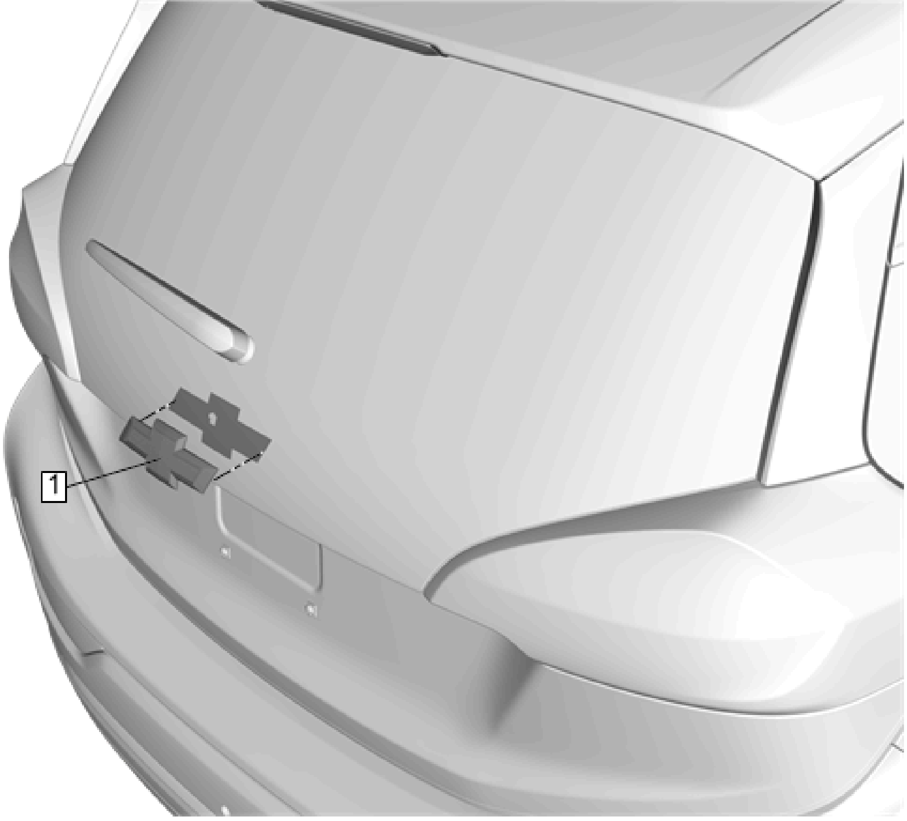

Fig. 2: Liftgate Emblem/Nameplate (Emblem)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Liftgate Emblem/Nameplate **CAUTION:** **Refer to Exterior Trim Emblem Removal Caution .** **Procedure** 1. The part and surface should be 21Â°C (70Â°F) prior to installation. The vehicle should remain 21Â°C (70Â°F) for one hour after assembly to allow adhesive to develop sufficient bond strength. 2. Use a commercial type Heat Gun or equivalent to remove the old nameplate. 3. Clean all adhesive from the liftgate panel and wipe the surface dry with a clean lint-free towel prior to installing the new nameplate. 4. Close the liftgate prior to installing the new nameplate. 5. When removing protective liners from the adhesive tape, be careful not to touch tape with hands and do not allow tape to come in contact with dirt or any foreign matter prior to adhesion. 6. Position and adhere the nameplate to the liftgate. 7. Using the palm of the hand, wet out the nameplate on the liftgate panel to ensure full adhesion of the nameplate is made.

LIFTGATE EMBLEM/NAMEPLATE REPLACEMENT (NAMEPLATE)

Removal Procedure

CAUTION: **Refer to Exterior Trim Emblem Removal Caution .**

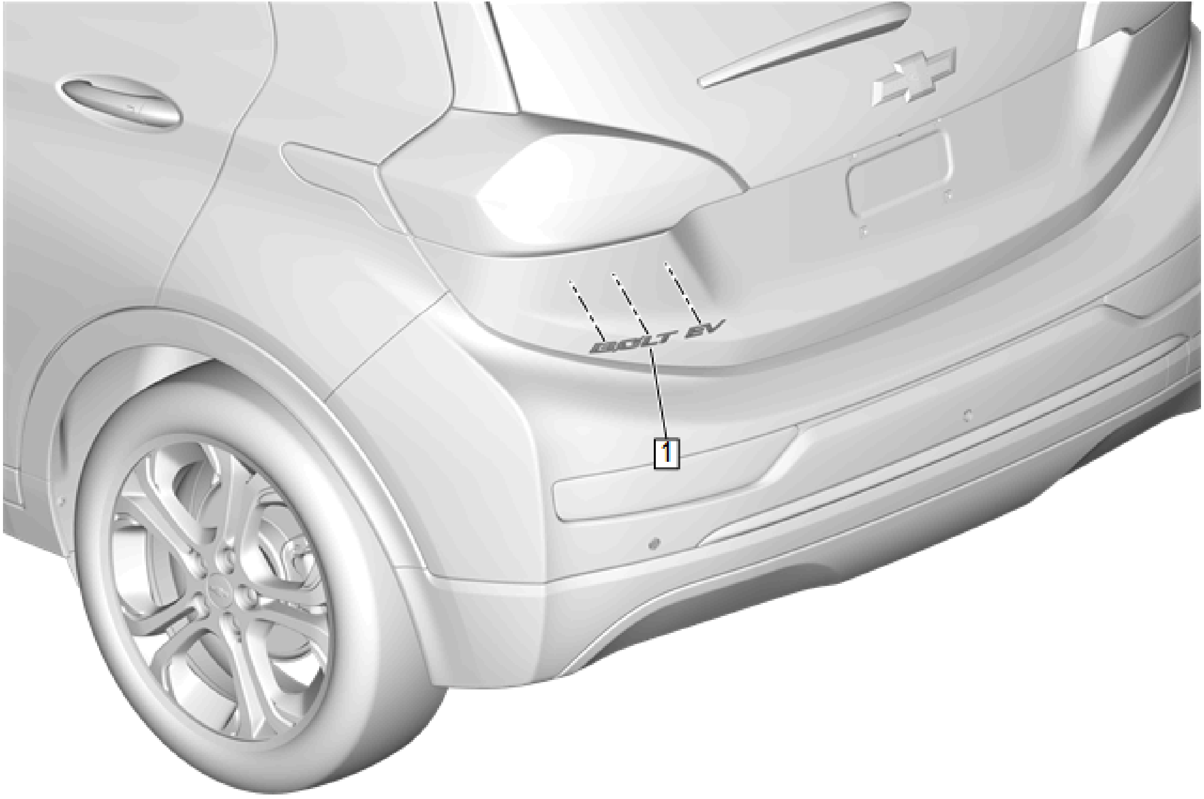

Fig. 3: Liftgate Emblem/Nameplate (Nameplate)
Courtesy of GENERAL MOTORS COMPANY

1. Perform the following steps to remove the liftgate nameplate lettering (1):
    1. Completely clean and dry the area that contains the nameplate lettering.
    2. To aid in installation, outline each individual letter with painter's tape or another suitable method. The lettering pieces may be individual or attached to each other.
    3. Use a commercial type Heat Gun or equivalent to remove the old nameplate lettering.
    4. Using a clean, lint-free towel, wipe the surface dry prior to installing the new nameplate lettering.

Installation Procedure

1. The part and surface should be 21Â°C (70Â°F) prior to installation. The vehicle should remain at 21Â°C (70Â°F) for a minimum of one hour after assembly to allow the adhesive to develop sufficient bond strength.

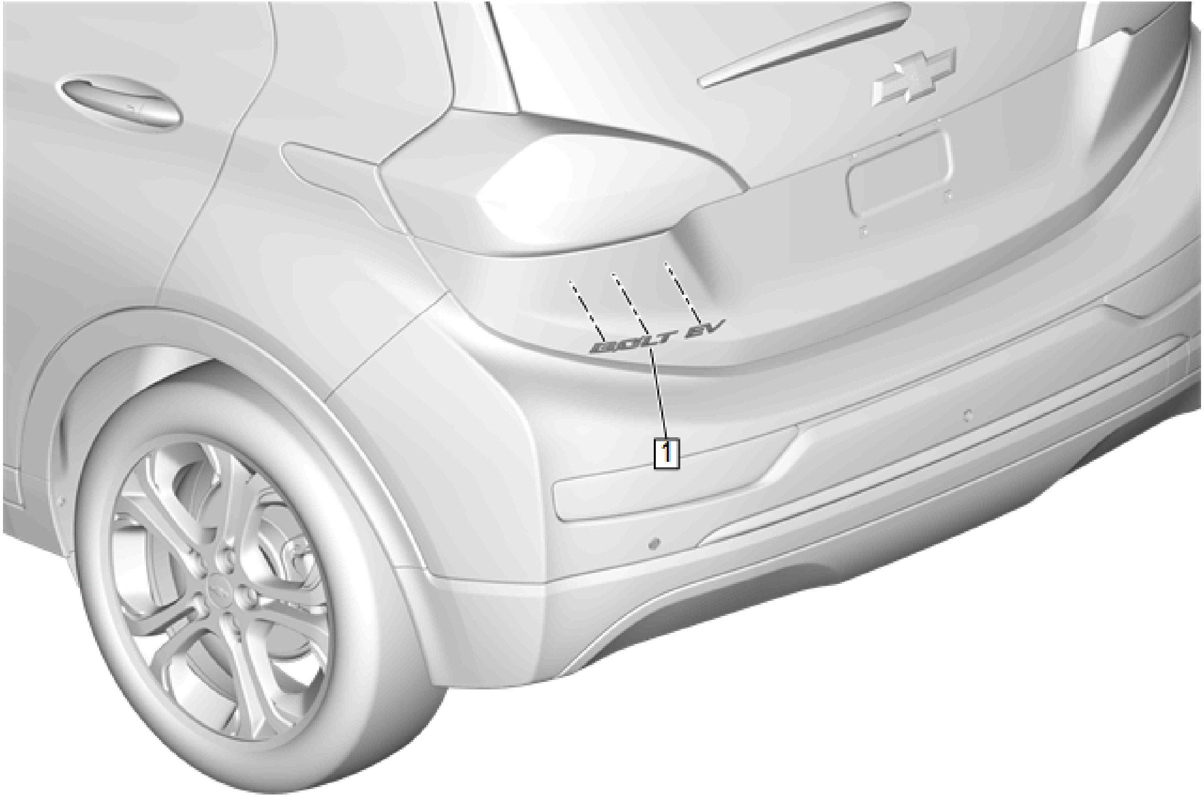

Fig. 4: Liftgate Emblem/Nameplate (Nameplate)
Courtesy of GENERAL MOTORS COMPANY

NOTE: **When removing the protective liners from the adhesive tape, be careful not to touch the tape and do not allow the tape to come in contact with any dirt or foreign matter.**

2. Perform the following steps to install the liftgate nameplate lettering (1):
    1. Close the liftgate prior to installing the new nameplate lettering.
    2. Remove the protective liner from the adhesive tape of the first nameplate letter and align it to the location marked previously.
    3. Apply the aligned letter and use the palm of the hand to ensure full adhesion has been made.
    4. Repeat the same steps with each letter additional letter.

BODY SIDE UPPER REAR APPLIQUE REPLACEMENT

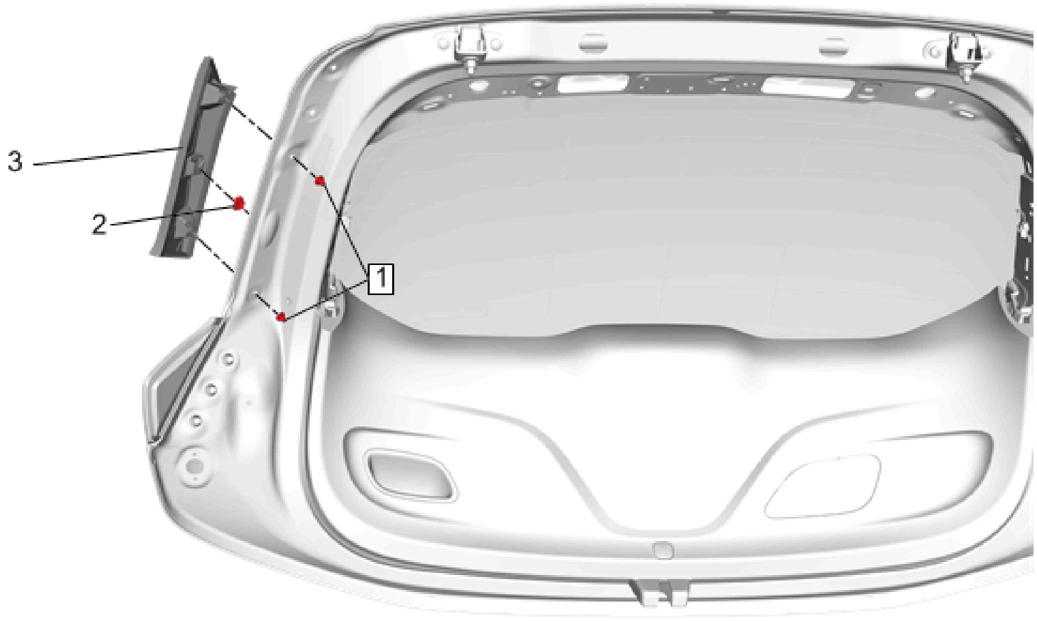

Fig. 5: Body Side Upper Rear Applique
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear End Spoiler Replacement	
1	Body Side Upper Rear Applique Nut **CAUTION:** Fastener Caution **Tighten** 4.7 N.m (42 lb in)
2	Body Side Upper Rear Applique Retainer
3	Body Side Upper Rear Applique **Procedure** 1. Gently pull up the applique. 2. Replace damaged retainers as needed.

FRONT SIDE DOOR WINDOW FRAME REAR APPLIQUE REPLACEMENT

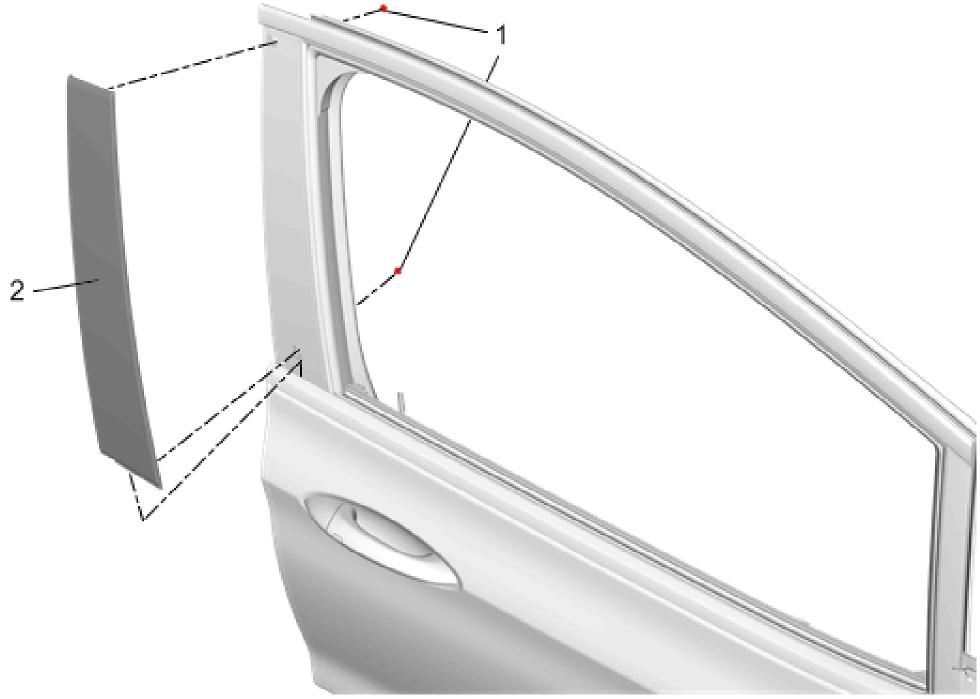

Fig. 6: Front Side Door Window Frame Rear Applique
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure **Front Side Door Weatherstrip Replacement - Door Side** **NOTE:** **It is not necessary to completely remove the weatherstrip. Reposition the rear edge of the front side door weatherstrip.**	
1	Front Side Door Weatherstrip Upper Retainer
2	Front Side Door Window Frame Rear Applique 1. Use a solution of 50/50 isopropyl alcohol and water to clean the adhesive surface. 2. Peel the protective film from the foam tape and install the rear applique to the vehicle.

REAR CLOSURE CENTER APPLIQUE REPLACEMENT

Removal Procedure

1. Open and support the rear liftgate.
2. Liftgate Lower Trim Finish Panel - Remove - **Liftgate Lower Trim Finish Panel Replacement**

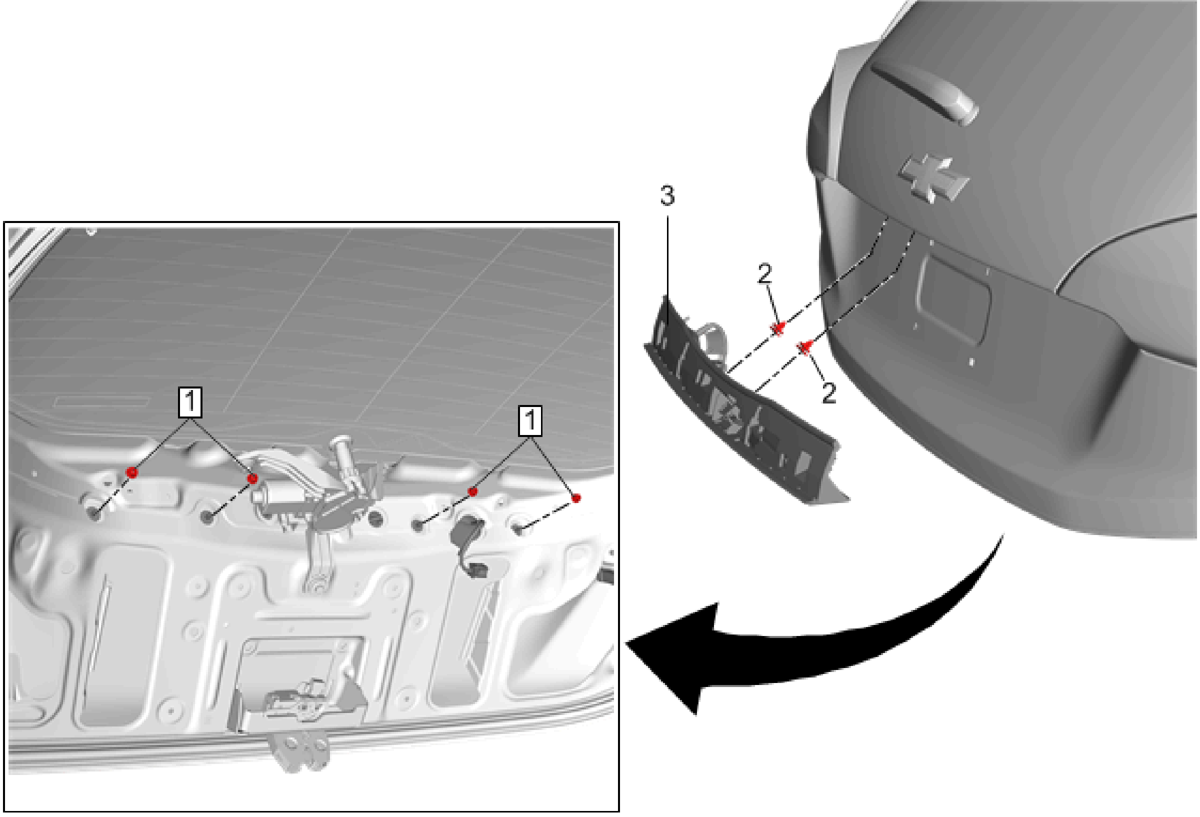

Fig. 7: Rear Closure Center Applique
Courtesy of GENERAL MOTORS COMPANY

3. Rear Closure Center Applique Nut (1) - Remove
4. Disconnect the electrical connectors.
5. Disconnect the backup camera washer hose.
6. Disengage the electrical grommets from the liftgate outer panel.
7. With a trim type release tool, disengage the two retainers (2) on the rear closure center applique.
8. Remove the rear closure center applique (3).
9. Replace any broken retainers.
10. Transfer parts as necessary.

Installation Procedure

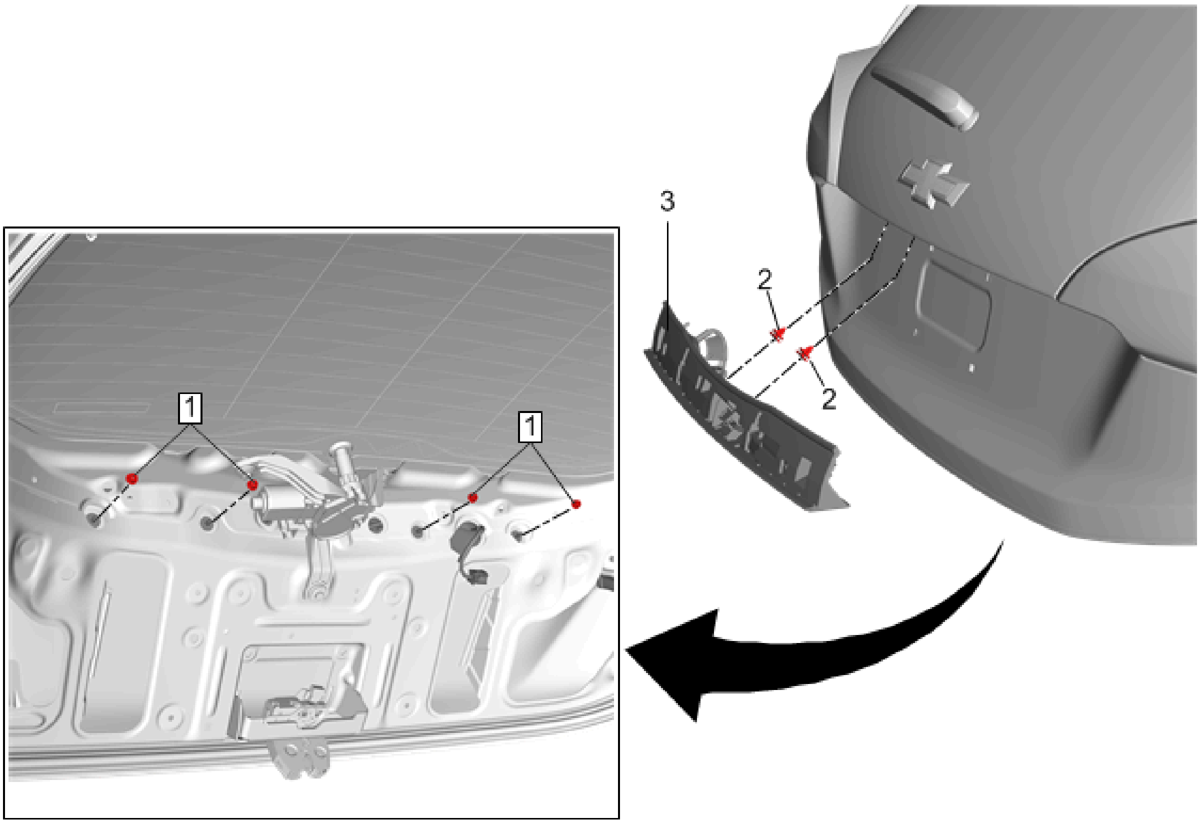

Fig. 8: Rear Closure Center Applique
Courtesy of GENERAL MOTORS COMPANY

1. Install the rear closure center applique (3).
2. Engage the electrical grommets to the liftgate outer panel.
3. Connect the backup camera washer hose.
4. Connect the electrical connectors.

CAUTION: **Refer to Fastener Caution .**

5. Rear Closure Center Applique Nut (1) - Install to 4.7 N.m (42 lb in)
6. Liftgate Lower Trim Finish Panel - Install - Liftgate Lower Trim Finish Panel Replacement
7. Close the rear liftgate.

REAR SIDE DOOR WINDOW FRAME FRONT APPLIQUE REPLACEMENT

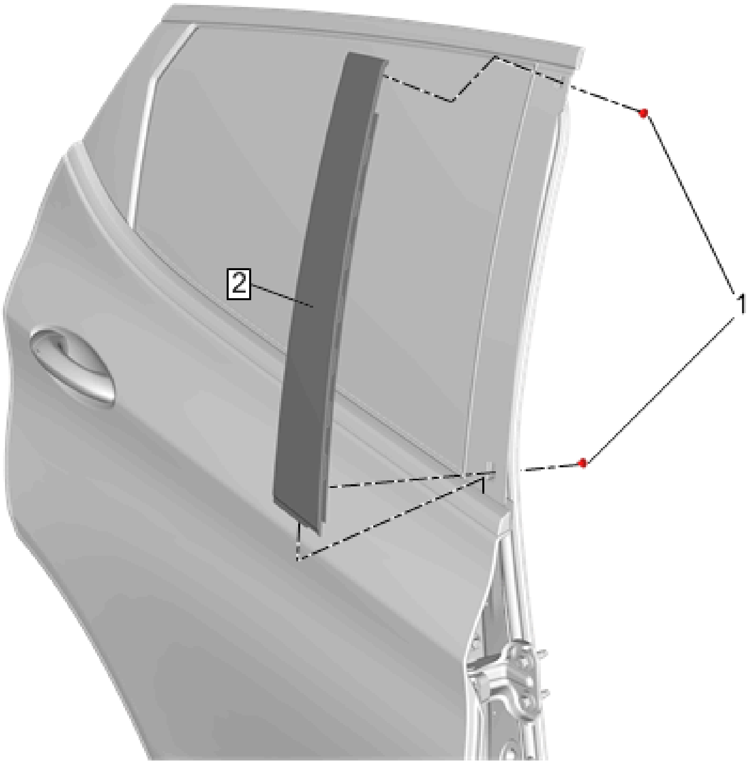

Fig. 9: Rear Side Door Window Frame Front Applique
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Side Door Weatherstrip Replacement - Door Side **NOTE:** **It is not necessary to completely remove the weatherstrip. Reposition the front edge of the rear side door weatherstrip.**	
1	Rear Side Door Weatherstrip Upper Retainer
2	Rear Side Door Window Frame Front Applique 1. Use a solution of 50/50 isopropyl alcohol and water to clean the adhesive surface. 2. Peel the protective film from the foam tape and install the rear applique to the vehicle.

REAR SIDE DOOR WINDOW FRAME REAR APPLIQUE REPLACEMENT

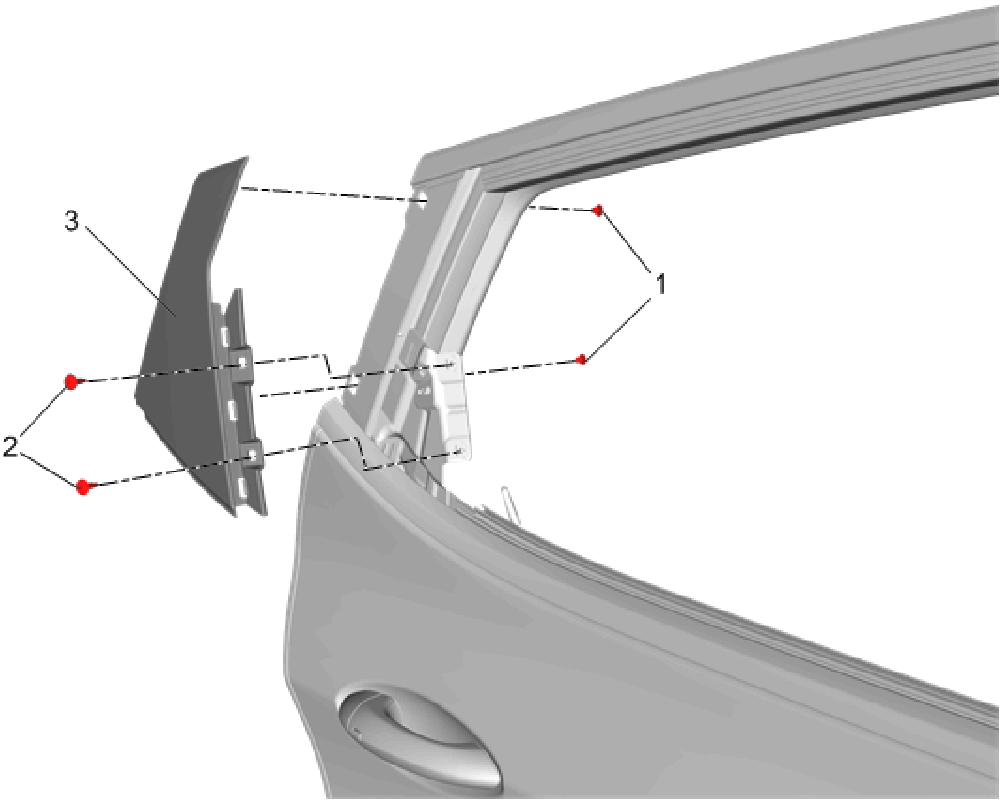

Fig. 10: Rear Side Door Window Frame Rear Applique
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Rear Side Door Weatherstrip Replacement - Door Side 2. Rear Side Door Window Weatherstrip Replacement **NOTE:** **It is not necessary to completely remove the weatherstrip. Reposition the weatherstrips to access the fasteners.**	
1	Rear Side Door Weatherstrip Upper Retainer
2	Rear Side Door Window Frame Front Applique Fastener **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
3	Rear Side Door Window Frame Front Applique 1. Use a solution of 50/50 isopropyl alcohol and water to clean the adhesive surface. 2. Peel the protective film from the foam tape and install the rear applique to the vehicle.

FRONT LICENSE PLATE BRACKET REPLACEMENT

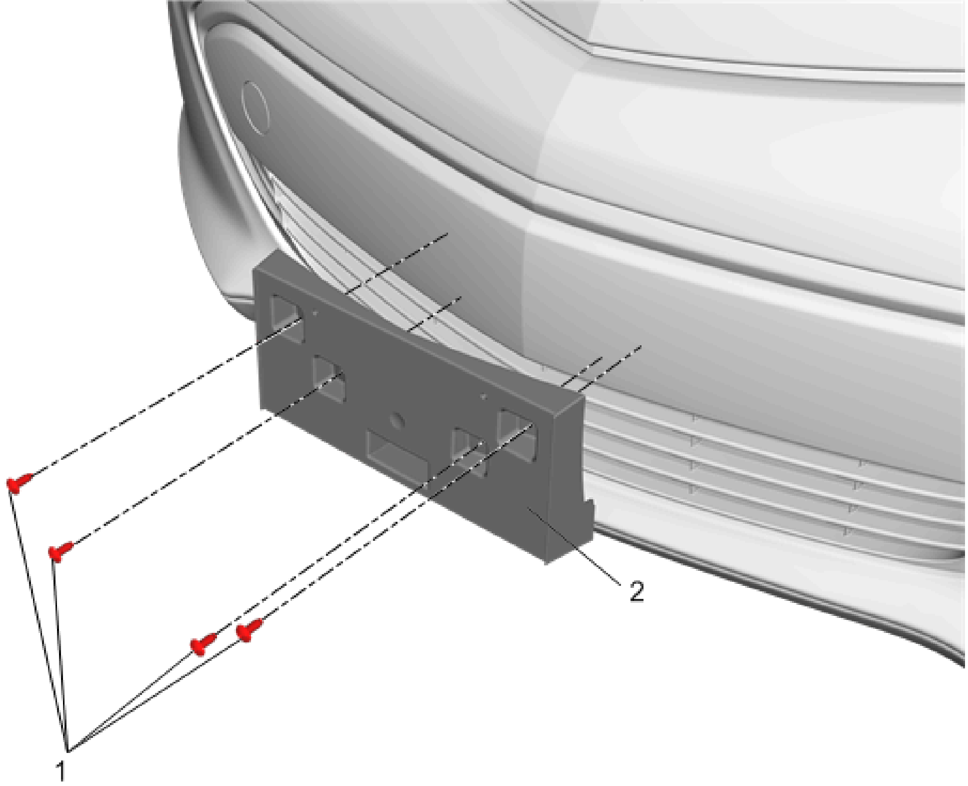

Fig. 11: Front License Plate Bracket
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front License Plate Bracket Fastener **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Front License Plate Bracket

FRONT BUMPER FASCIA TOW EYE ACCESS HOLE COVER REPLACEMENT

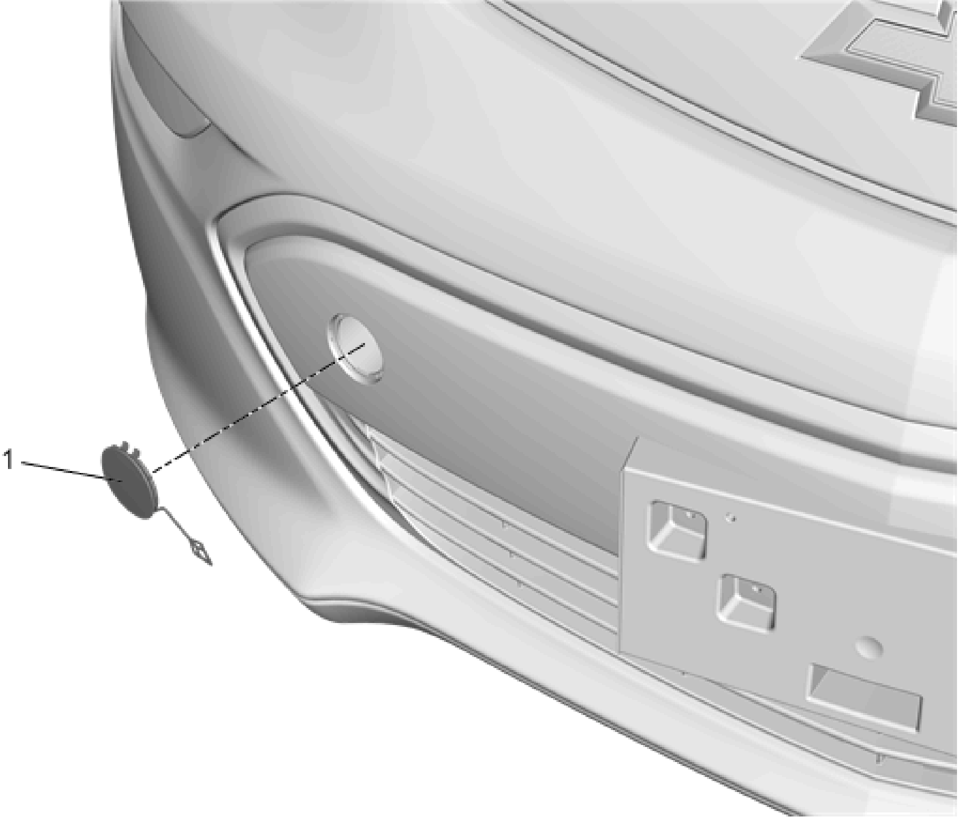

Fig. 12: Front Bumper Fascia Tow Eye Access Hole Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Bumper Fascia Front Tow Eye Access Hole Cover **Procedures** 1. Using a small flat-bladed tool, release the cover from the front bumper fascia. 2. Using needle nose pliers, release the hook from the square in the front fascia and remove.

FRONT BUMPER FASCIA EMBLEM/NAMEPLATE REPLACEMENT

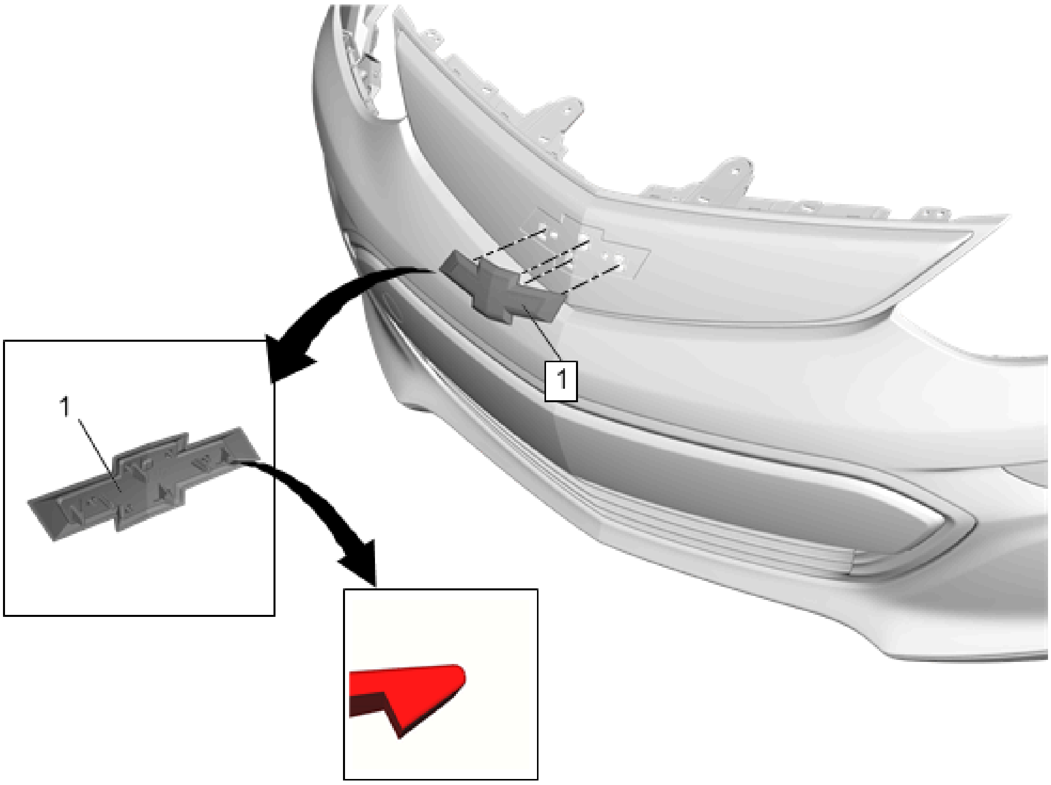

Fig. 13: Front Bumper Fascia Emblem/Nameplate
Courtesy of GENERAL MOTORS COMPANY

<table>
<tr><th>Callout</th><th>Component Name</th></tr>
<tr><td colspan="2">CAUTION:
To avoid paint damage, protect the area surrounding the part which you are removing or installing.
Preliminary Procedure Front Compartment Front Sight Shield Replacement</td></tr>
<tr><td>1</td><td>Radiator Grille Emblem/Nameplate
Procedure
Using a suitable flat bladed tool, release the four locking tabs from the rear side of the front upper grille and pull radiator grille emblem from the front upper grille.
NOTE:
Use care when releasing the tabs, to not contact the grille. Ensure that the tabs are properly engaged upon installation.</td></tr>
</table>

FRONT WHEEL OPENING MOLDING REPLACEMENT

Callout	Component Name
3	Front Wheel Opening Molding **Procedure** 1. Apply two layers of masking tape around the edge of the front wheel opening molding to prevent any paint surface damage. 2. Carefully remove the clips that attached the molding to the bumper from the inside of the front wheelhouse using pliers. 3. Work from the front fender area to the bumper area.

FRONT UPPER GRILLE REPLACEMENT

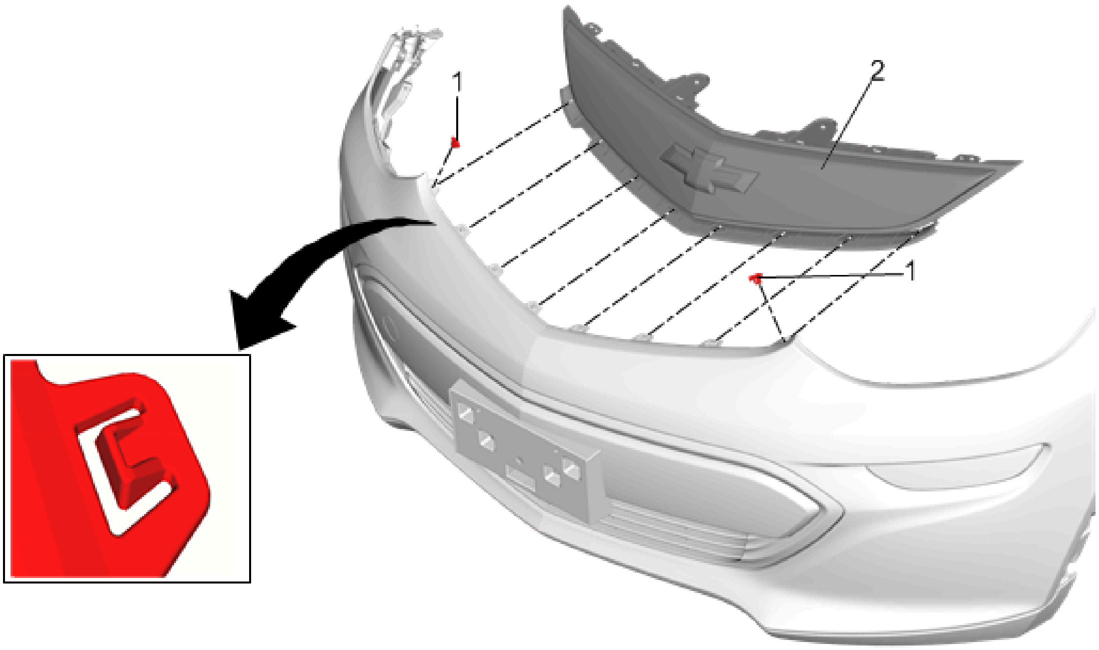

Fig. 15: Front Upper Grille
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure **Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea)**	
1	Front Bumper Impact Bar Binding Band Clip
2	Front Upper Grille **Procedure** 1. Unclip the electrical connector from the grille. 2. Release the front upper grille from the front bumper fascia grille tabs. 3. Pull the front upper grille from the backside of the front bumper fascia. 4. Transfer components as necessary.

FRONT LOWER GRILLE REPLACEMENT

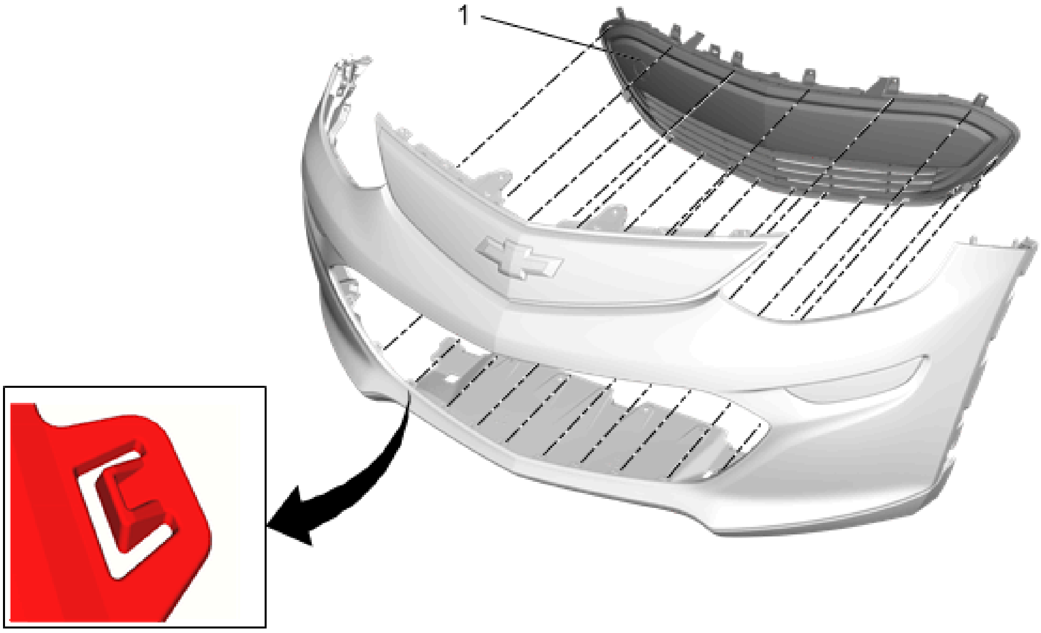

Fig. 16: Front Lower Grille
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Front Bumper Fascia Replacement (North America) Front Bumper Fascia Replacement (Europe, Korea) 2. Front Bumper Impact Absorber Replacement (North America) Front Bumper Impact Absorber Replacement (Europe, Korea) 3. Ambient Air Temperature Sensor Replacement 4. Front View Driver Information Camera Replacement 5. Reposition the electrical wiring harness around the front lower grille.	
1	Front Lower Grille **Procedure** 1. Release the front lower grille from the front bumper fascia grille retainers and grille tabs. 2. Pull the front lower grille from the backside of the front bumper fascia. 3. Remove the front license plate bracket as necessary. Front License Plate Bracket Replacement

BODY SIDE REAR MOLDING REPLACEMENT

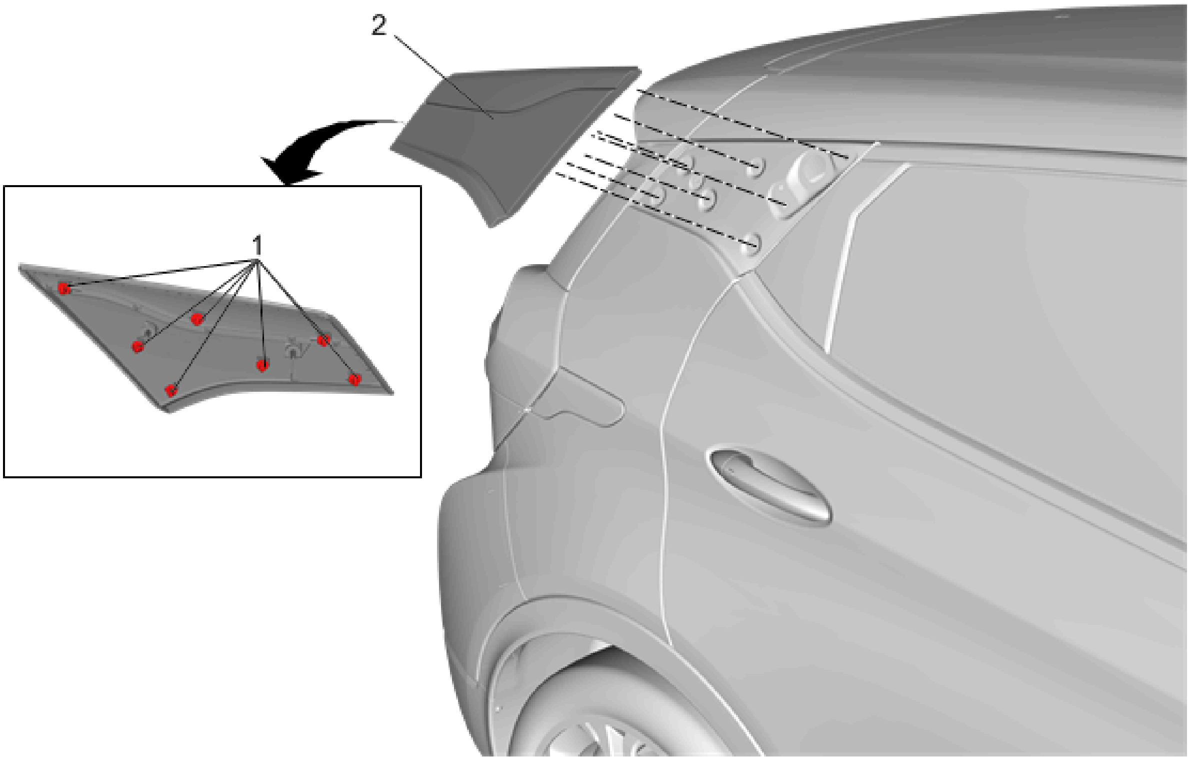

Fig. 17: Body Side Rear Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Open the rear side door and the liftgate	
1	Body Side Rear Molding Retainer
2	Body Side Rear Molding **Procedure** 1. Apply two layers of masking tape around the top edge of the body side rear molding to prevent any paint surface damage. 2. Starting at the front top corner, use a flat bladed plastic tool to release the front side door lower molding retainers. 3. Replace the body side rear molding retainers as needed.

FRONT SIDE DOOR MOLDING INSERT REPLACEMENT

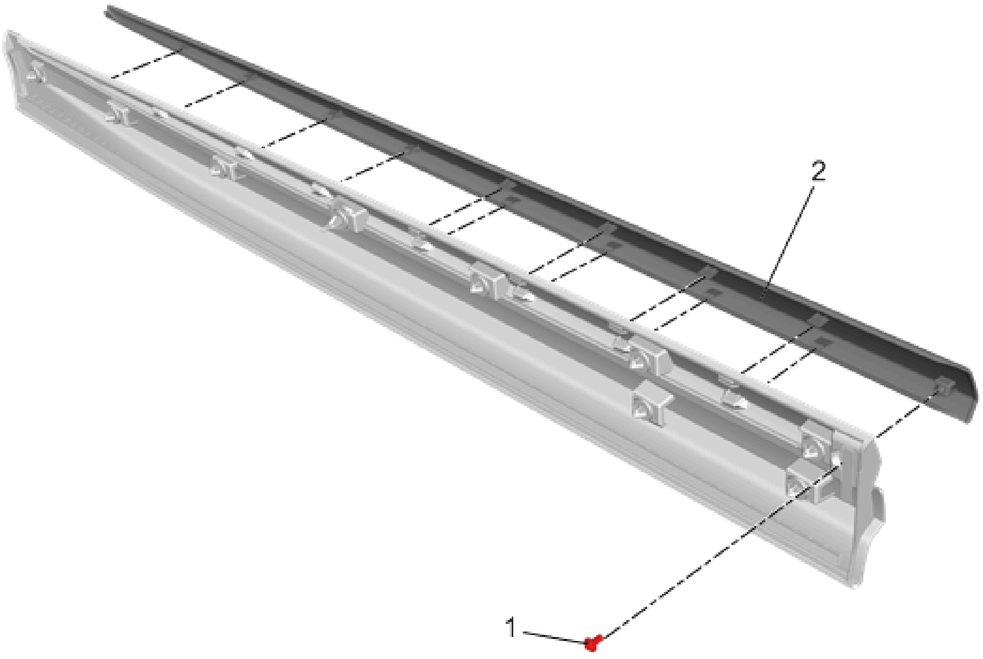

Fig. 18: Front Side Door Molding Insert
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Front Side Door Lower Molding Replacement	
1	Front Side Door Molding Insert Fastener **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Front Side Door Molding Insert

FRONT SIDE DOOR LOWER MOLDING REPLACEMENT

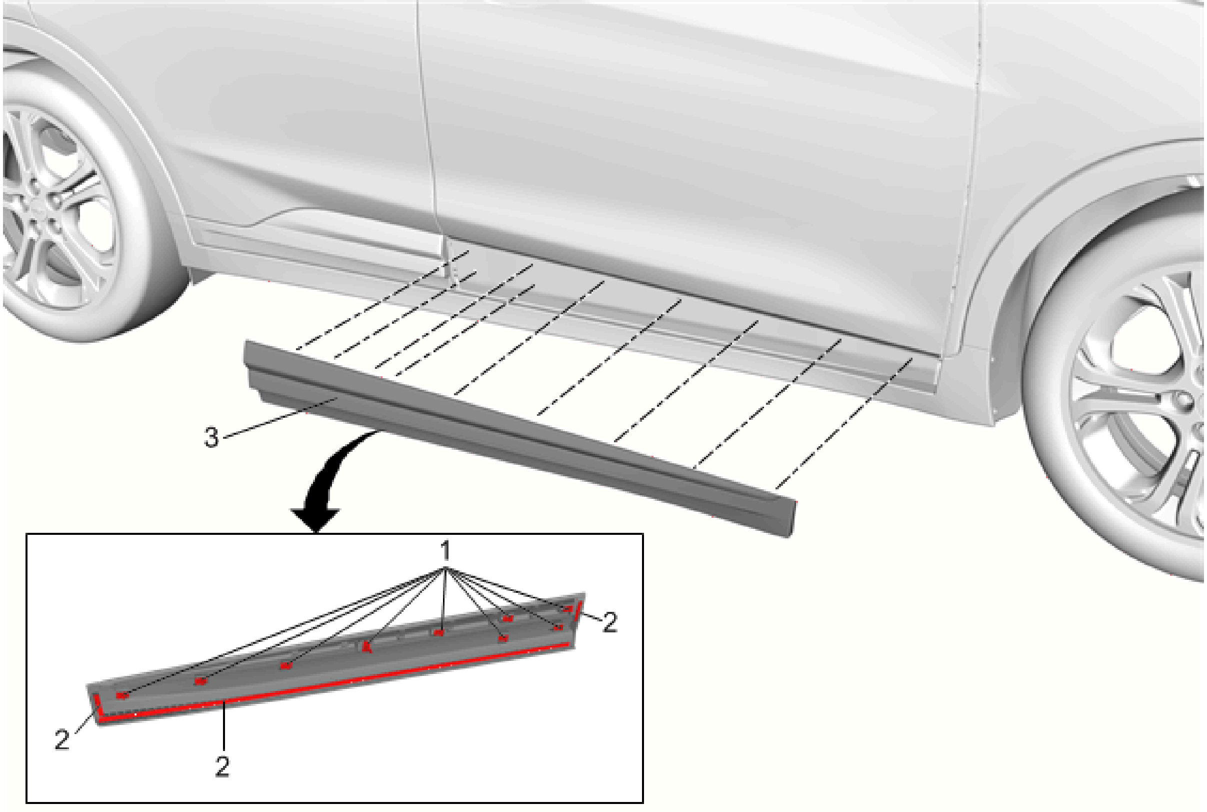

Fig. 19: Front Side Door Lower Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Side Door Lower Molding Retainer
2	Front Side Door Lower Molding Double Adhesive Tape
3	Front Side Door Lower Molding **Procedure** 1. Apply two layers of masking tape around the top edge of the front side door lower molding to prevent any paint surface damage. 2. Starting at the front top corner using a suitable flat bladed plastic tool release the nine front side door lower molding retainers. 3. Replace the front side door lower molding retainers as needed. 4. Using a 50/50 mixture of isopropyl alcohol and clean drinkable water and a clean towel, remove the left over adhesive residue from the masking tape.

FRONT FENDER UPPER REAR MOLDING REPLACEMENT

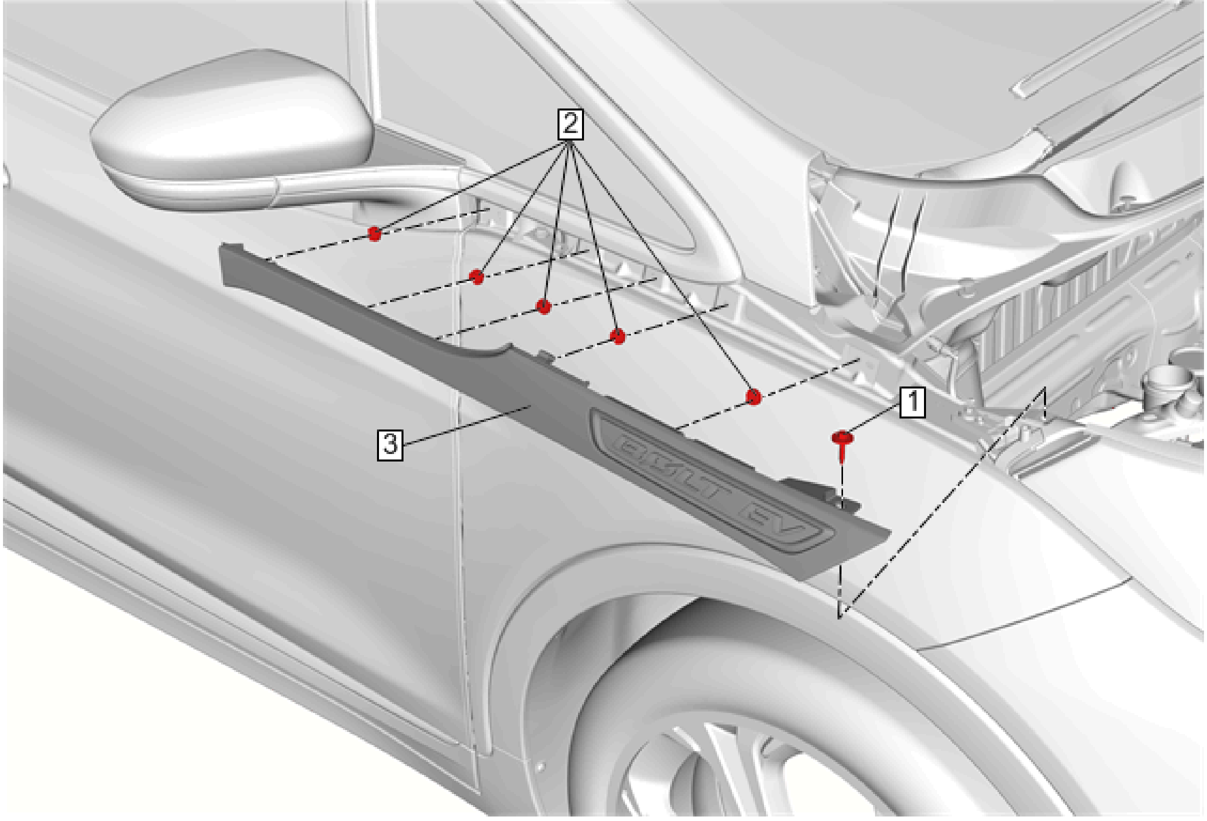

Fig. 20: Front Fender Upper Rear Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Open the hood.	
1	Front Fender Upper Rear Molding Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Front Fender Upper Rear Molding Retainer **Procedure** Using the appropriate tool, release the five molding retainers.
3	Front Fender Upper Rear Molding **Procedure** Transfer components as necessary. **NOTE:** **Transferring the emblem/nameplate is not possible, the emblem/nameplate will be damaged if it is removed from the molding.**

REAR SIDE DOOR MOLDING INSERT REPLACEMENT

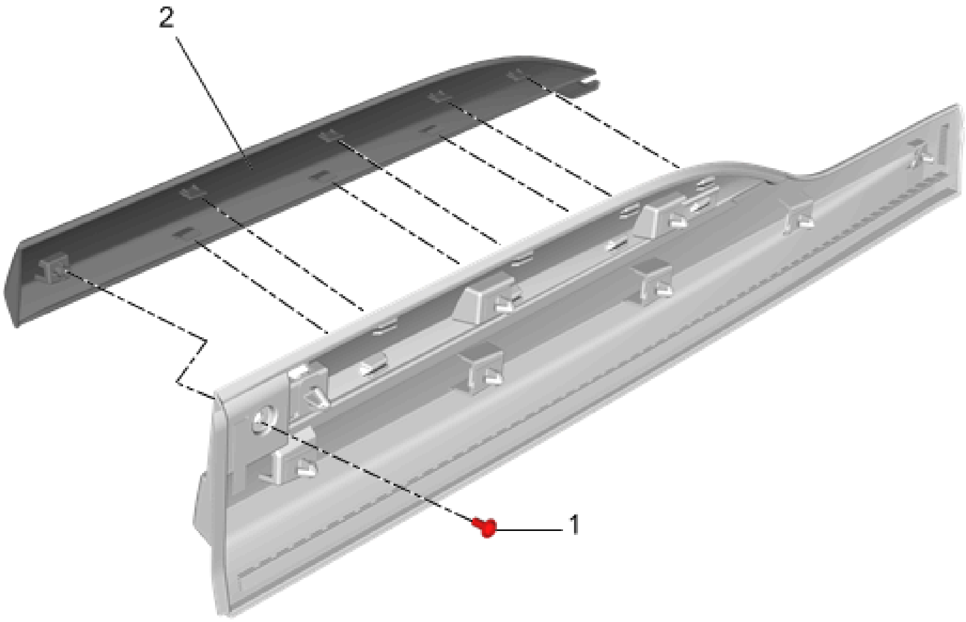

Fig. 21: Rear Side Door Molding Insert
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Side Door Lower Molding Replacement	
1	Rear Side Door Molding Insert Fastener **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Rear Side Door Molding Insert

REAR SIDE DOOR LOWER MOLDING REPLACEMENT

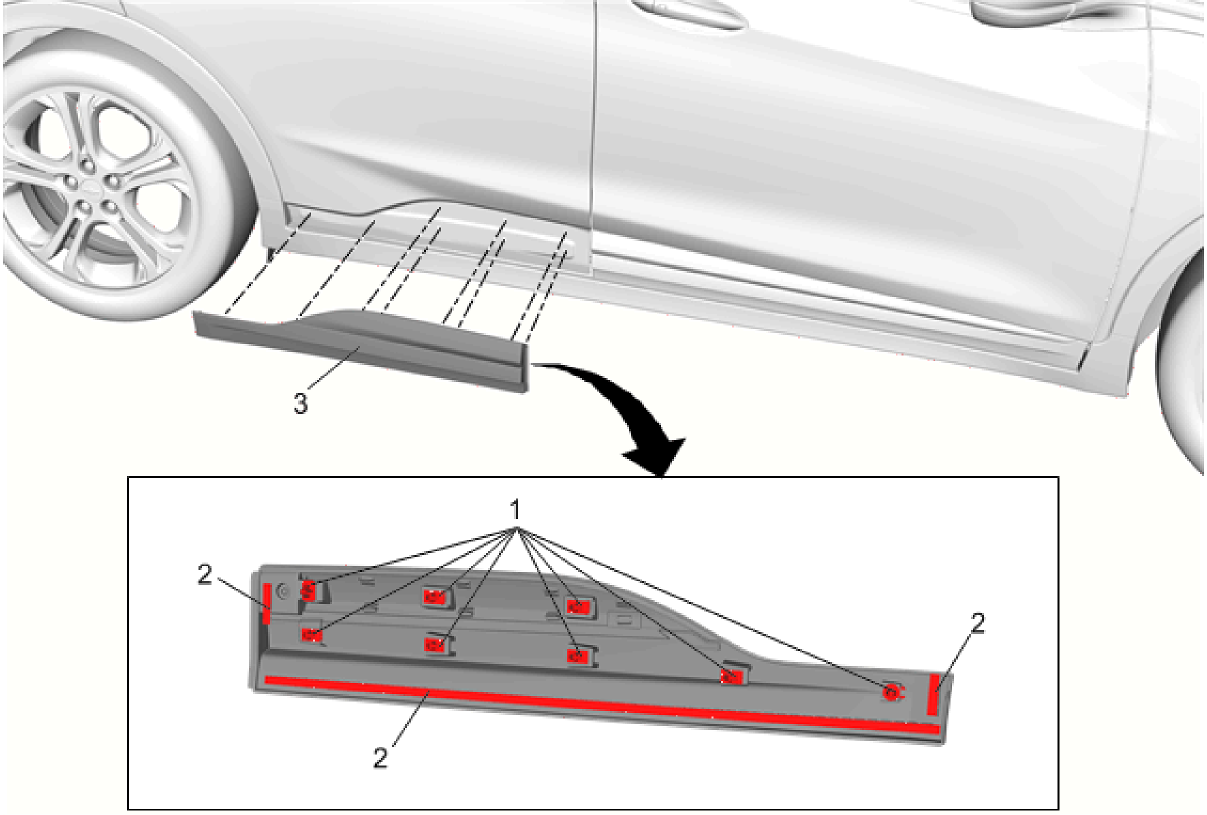

Fig. 22: Rear Side Door Lower Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Side Door Lower Molding Retainer
2	Rear Side Door Lower Molding Double Adhesive Tape
3	Rear Side Door Lower Molding **Procedure** 1. Apply two layers of masking tape around the top edge of the rear side door lower molding to prevent any paint surface damage. 2. Starting at the front top corner, use a flat bladed plastic tool release the rear side door lower molding retainers. 3. Replace the rear side door lower molding retainers as needed. 4. Using a 50/50 mixture of isopropyl alcohol and clean drinkable water and a clean towel, remove the left over adhesive residue from the masking tape.

REAR WHEEL OPENING MOLDING REPLACEMENT

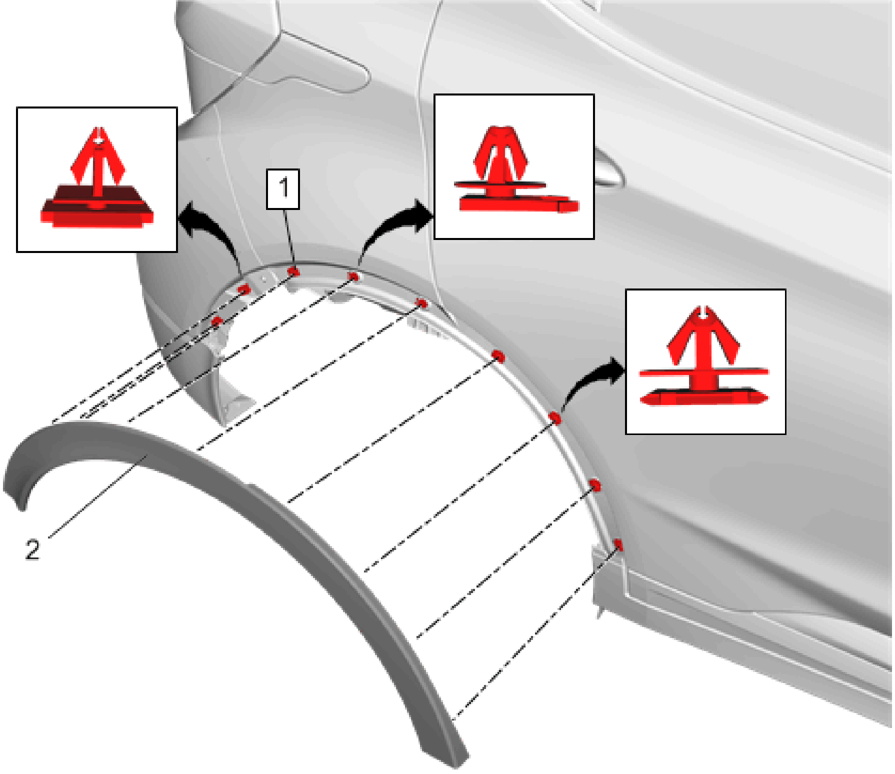

Fig. 23: Rear Wheel Opening Molding
Courtesy of GENERAL MOTORS COMPANY

<table>
<tr><th>Callout</th><th>Component Name</th></tr>
<tr><td colspan="2">Preliminary Procedure
1. Open the rear side door.
2. Rear Wheelhouse Liner Replacement</td></tr>
<tr><td>1</td><td>Rear Wheel Opening Molding Retainer</td></tr>
<tr><td>2</td><td>Rear Wheel Opening Molding
Procedure
1. Apply two layers of masking tape around the edge of the rear wheel opening molding to prevent any paint surface damage.
2. Using a trim type release tool, working from the inside fender flange area, disengage the seven retainers from the body side outer panel and then the two retainers from the rear bumper fascia.
3. Pull the rear wheel opening molding upward to slide the tab on the wheel opening molding out of the rear fascia.
4. Replace the rear wheel opening molding retainers as needed.
5. Using a 50/50 mixture of isopropyl alcohol and clean drinkable water and a clean towel, remove the left over adhesive residue from the masking tape.
NOTE:
After removing the molding it is mandatory to wax the retainer holes outside and from the inner wheelhouse to help prevent corrosion.</td></tr>
</table>

ROCKER PANEL MOLDING REPLACEMENT

Removal Procedure

1. Open both side doors in order to remove the rocker panel front molding assembly.
2. Partly remove and reposition the front wheel opening molding. Front Wheel Opening Molding Replacement

3. Partly remove and reposition the rear wheel opening molding. **Rear Wheel Opening Molding Replacement**

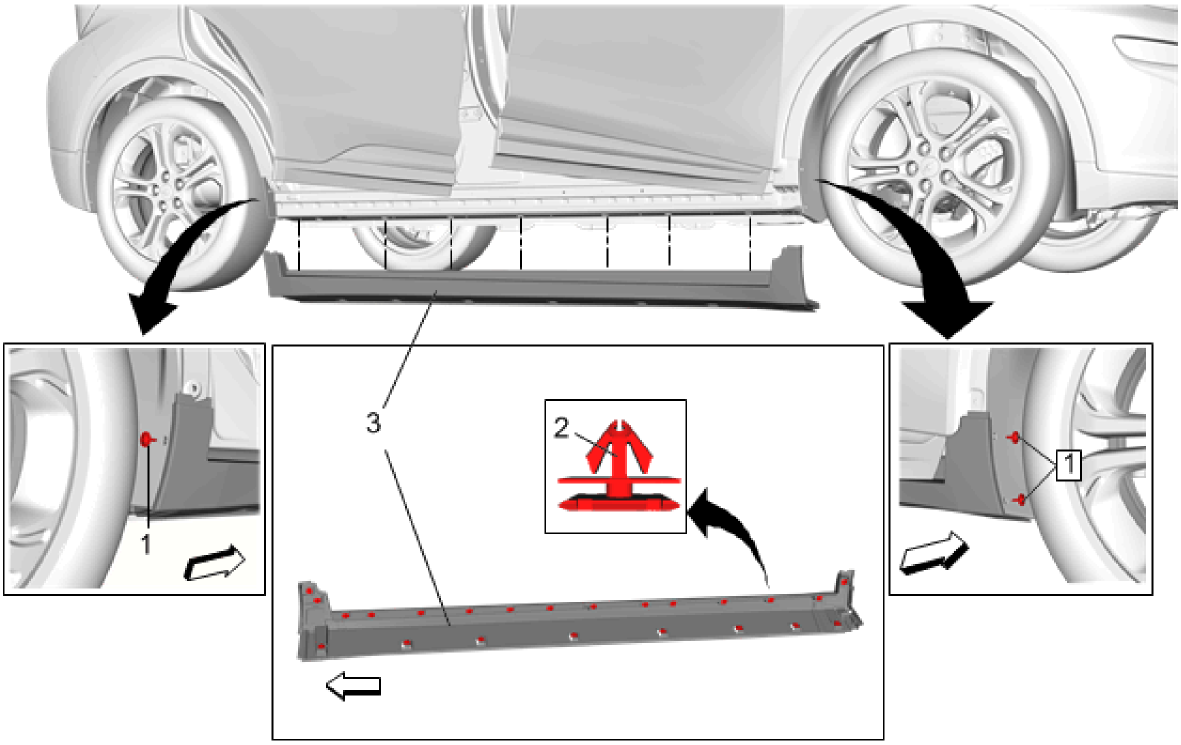

Fig. 24: Wheelhouse Liner Screw
Courtesy of GENERAL MOTORS COMPANY

4. Wheelhouse Liner Screw - Remove
5. Apply masking tape to the painted surfaces.
6. Release the fifteen side retainers.
7. Release the front lower retainer.
8. Pull the upper portion of the molding (3) away and slide the rocker molding (3) rearward to release the lower retainer form the molding (3).
9. Release the seven remaining lower rocker molding retainers from the body.

Installation Procedure

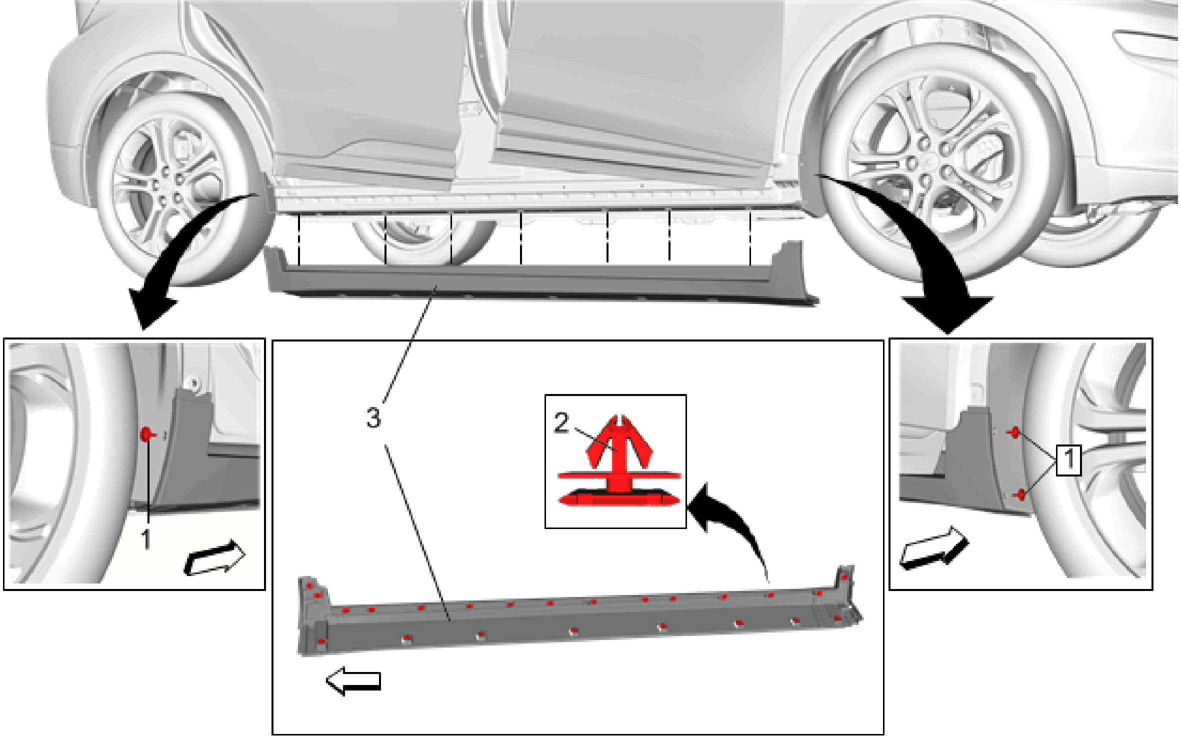

Fig. 25: Wheelhouse Liner Screw
Courtesy of GENERAL MOTORS COMPANY

CAUTION: **Refer to Fastener Caution .**

1. Install new retainers as required.
2. Install the molding (3) to the vehicle and engage all retainers (2).
3. Remove the masking tape.
4. Wheelhouse Liner Screw (1) - Install to 2.5 N.m (22 lb in)
5. Install the rear wheel opening molding. **Rear Wheel Opening Molding Replacement**
6. Install the front wheel opening molding. **Front Wheel Opening Molding Replacement**
7. Close side doors.

REAR END SPOILER REPLACEMENT

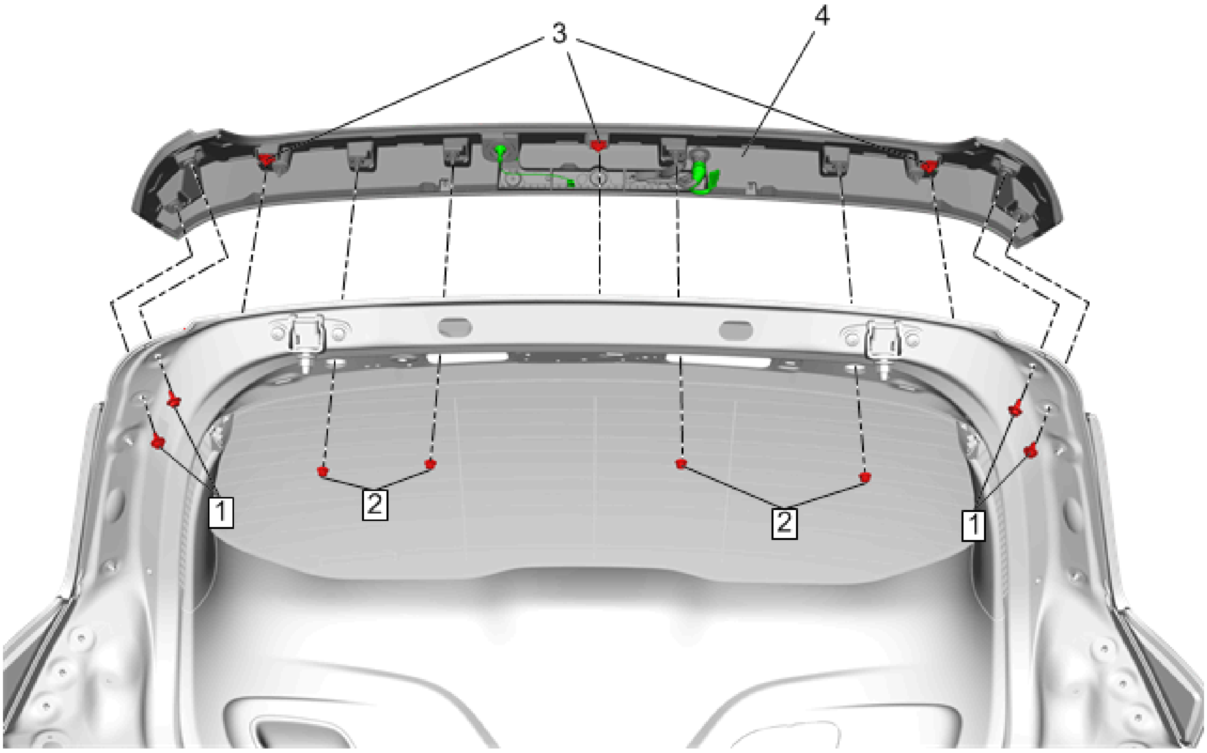

Fig. 26: Rear End Spoiler
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Liftgate Upper Center Trim Finish Panel Replacement	
1	Rear End Spoiler Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 5 N.m (44 lb in)
2	Rear End Spoiler Nut **Tighten** 5 N.m (44 lb in)
3	Rear End Spoiler Retainer **Procedure** Using the appropriate tool, release the rear end spoiler retainers.
4	Rear End Spoiler **Procedure** 1. Disconnect the electrical connector. 2. Disconnect the rear window washer hose from the rear window washer nozzle. 3. Transfer components as necessary.

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B0283: REAR DEFOGGER CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check - Vehicle
- Review the description of Strategy Based Diagnosis: Strategy Based Diagnosis
- An overview of each diagnostic category can be found here: Diagnostic Procedure Instructions

DTC Descriptor

DTC B0283

Rear Defogger Circuit

Symptom Byte Information: Symptom Byte List

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control - Relay Coil	B0283 02	B0283 05	B0283 05	-
Ground - Relay Coil	-	B0283 05	-	-

Circuit/System Description

For an overview of the component/system, refer to: **Rear Window Defogger Description and Operation**

Circuit	Description
B+ - Relay Switch	Supplied from a fuse.
E18 Rear Defogger GridControl - Component	The output circuit is switched to 12 V to activate the component.
Control - Relay Coil	The output circuit is switched to 12 V to activate the component.
E18 Rear Defogger GridGround - Component	Chassis Ground
Ground - Relay Coil	Chassis Ground

Component	Description
KR5 Rear Defogger Relay	A relay is a switch that is actuated by a solenoid.
E18 Rear Defogger Grid	Window defoggers are parallel resistive conductors in or on the glass that heat up when electric power is applied.
K33 HVAC Control Module	The control module controls a series of actuators to ensure optimal heating, ventilation and air conditioning of the passenger compartment. The control module does this by reading values from a variety of sensors and interprets the data and adjusts the actuators accordingly.
A26 HVAC Controls	This device is the user interface to control the HVAC system. Some buttons and indicators are hardwired, some functions use serial data communication.

Conditions for Running the DTC

Ignition - On / Vehicle - In Service Mode

Conditions for Setting the DTC

- B0283 02 Control Circuit = Short to Ground
- B0283 05 Control Circuit = OpenorShort to Battery

Actions Taken When the DTC Sets

- B0283 02E18 Rear Defogger Grid = Disabled
- B0283 05E18 Rear Defogger Grid = DisabledorAlways On

Conditions for Clearing the DTC

- A current DTC will clear when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles.

Control Module References

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Perform the scan tool control function: Rear Defogger - On and Off

   Verify the component turns On and Off: E18 Rear Defogger Grid

   - **If the component does not turn On and Off**

     Refer to: Circuit/System Testing

   - **If the component turns On and Off**
3. All OK.

Circuit/System Testing

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Remove the component: KR5 Rear Defogger Relay
3. Test for less than 10 Ω between the test points: Ground circuit terminal 86 & Ground
   - **If 10 Ω or greater**
   1. Ground Connection - Disconnect
   2. Test for less than 2 Ω between the test points: Ground circuit terminal 86 & Ground Connection
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Connect a test lamp between the test points: Control circuit terminal 85 & Ground circuit terminal 86
5. Ignition - On / Vehicle - In Service Mode
6. Perform the scan tool control function: Rear Defogger - On and Off

   Verify the test lamp turns On and Off.

   - **If the test lamp is always Off**
   1. Ignition/Vehicle - Off & Remove - Test lamp
   2. Disconnect the electrical connector: K33 HVAC Control Module
   3. Test for infinite resistance between the test points: Control circuit terminal 85 at Relay Socket & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance
   4. Test for less than 2 Ω between the test points: Control circuit terminal 85 at Relay Socket & Terminal 19 X2 at Control module harness
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Replace the component: K33 HVAC Control Module

    - **If the test lamp is always On**

    1. Ignition/Vehicle - Off & Remove - Test lamp
    2. Disconnect the electrical connector: K33 HVAC Control Module
    3. Ignition - On / Vehicle - In Service Mode
    4. Test for less than 1 V between the test points: Control circuit terminal 85 at Relay Socket & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V - Replace the component: K33 HVAC Control Module

    - **If the test lamp turns On and Off**

7. Test or replace the component: KR5 Rear Defogger Relay

Component Testing

Relay Test

1. Ignition/Vehicle - Off
2. Remove the component: KR5 Rear Defogger Relay
3. Test for 70 to 110 Ω between the test points: Component terminal 85 & Component terminal 86
    - **If not between 70 and 110 Ω**

      Replace the component: KR5 Rear Defogger Relay

    - **If between 70 and 110 Ω**
4. Test for infinite resistance between the test points:
    - Component terminal 30 & 85
    - Component terminal 30 & 86
    - Component terminal 30 & 87
    - Component terminal 85 & 87
    - **If less than infinite resistance**

      Replace the component: KR5 Rear Defogger Relay

    - **If infinite resistance**
5. Connect a 3 A fused jumper wire between the test points: Component terminal 86 & 12 V

   Connect a jumper wire between the test points: Component terminal 85 & Ground

6. Test for less than 2 Ω between the test points: Component terminal 30 & Component terminal 87
    - **If 2 Ω or greater**

      Replace the component: KR5 Rear Defogger Relay

    - **If less than 2 Ω**
7. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: Diagnostic Repair Verification

- Relay Replacement (Attached to Wire Harness) Relay Replacement (Within an Electrical Center)
- For control module replacement, programming, and setup refer to: Control Module References

DTC B316B, B317A, B318A, OR B319A: WINDOW SWITCH

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B316B

For symptom byte information refer to: **Symptom Byte List**

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Driver Window Switch Down Signal	B316B 02	1	1	-
Driver Window Switch Up Signal	B316B 02	2	2	-
Driver Window Switch Express Signal	B316B 02	3	3	-
1. Driver window switch down function inoperative 2. Driver window switch up function inoperative 3. Driver window switch express function inoperative				

Circuit/System Description

The driver window motor supplies 12 V signal circuits to the driver window switch, when a window switch has been activated, a switch closes providing a ground to the appropriate signal circuit causing the voltage to drop to 0 V. The driver window motor will detect the voltage drop in the signal circuit and will command the window to move in the desired direction.

The driver window/outside rearview mirror switch also contains control switches for the passenger, left rear and right rear window functions. When a window switch is pressed, a serial data message is sent to the body control module. The body control module examines the request and checks for messages from other power window motors that may prohibit window movement. If no prohibitive messages have been received, the body control module will send a serial data message to the appropriate passenger or rear window switch which will perform the command as requested.

Conditions for Running the DTC

Battery voltage must be between 9 - 16 V.

Conditions for Setting the DTC

B316B 00

The body control module has detected a control switch on the driver window/outside rearview mirror switch has been active for greater than 60 seconds.

B316B 02

The driver window motor has detected the driver window/outside rearview mirror switch is active for greater than 60 seconds.

B316B 39

The driver window motor has detected an internal failure within the driver window/outside rearview mirror switch.

B317A 02

The body control module has detected the passenger window switch is active for greater than 60 seconds.

B317A 39

The body control module has detected an internal failure within the passenger window switch.

B318A 02

The body control module has detected the left rear window switch is active for greater than 60 seconds.

B318A 39

The body control module has detected an internal failure within the left rear window switch.

B319A 02

The body control module has detected the right rear window switch is active for greater than 60 seconds.

B319A 39

The body control module has detected an internal failure within the right rear window switch.

Action Taken When the DTC Sets

The affected power window will malfunction.

Conditions for Clearing the DTC

B316B 00, B316B 02, B317A 02, B318A 02, B319A 02

- The DTC will be current for as long as the fault is present.
- The DTC will change from current to history when the fault is no longer present.
- A history DTC will clear after 100 consecutive ignition cycles if the condition for the malfunction is no longer present.

B316B 39, B317A 39, B318A 39, B319A 39

If the DTC is current, the affected window switch must be replaced before the DTC can be cleared.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool parameters listed below change when pressing and pulling the passenger and rear window control switches on the S146 Window/Outside Rearview Mirror Switch-Driver:
    - Left Rear Main Control Down Switch - Inactive and Active
    - Left Rear Main Control Express Switch - Inactive and Active
    - Left Rear Main Control Up Switch - Inactive and Active
    - Right Rear Main Control Down Switch - Inactive and Active
    - Right Rear Main Control Express Switch - Inactive and Active
    - Right Rear Main Control Up Switch - Inactive and Active
    - Front Passenger Main Control Down Switch - Inactive and Active
    - Front Passenger Main Control Express Switch - Inactive and Active
    - Front Passenger Main Control Up Switch - Inactive and Active
    - **If any parameter does not change**

      Replace the S146 Window/Outside Rearview Mirror Switch-Driver.

    - **If the parameters change**
3. Verify the scan tool parameters listed below change when pressing and pulling the S79P Window Switch-Passenger, the S79LR Window Switch-Left Rear and the S79RR Window Switch-Right Rear.
    - Passenger Window Switch at Door - Inactive, Up, Down, Express Down
    - Left Rear Window Switch at Door - Inactive, Up, Down, Express Down
    - Right Rear Window Switch at Door - Inactive, Up, Down, Express Down
    - **If any parameter does not change**

      Test or replace the appropriate passenger or rear S79 Window Switch

    - **If all the parameters change**
4. Verify the scan tool parameters listed below change when pressing and pulling the driver window control switch on the S146 Window/Outside Rearview Mirror Switch-Driver:
    - Driver Window Main Control Down Switch - Inactive and Active
    - Driver Window Main Control Up Switch - Inactive and Active
    - Driver Window Main Control Express Down Switch - Inactive and Active
    - Driver Window Main Control Express Up Switch - Inactive and Active
    - **If any parameter does not change**

      Refer to Circuit/System Testing.

    - **If all the parameters change**
5. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S146 Window/Outside Rearview Mirror Switch-Driver. It may take up to 2 minutes for all vehicle systems

to power down.

2. Test for less than 10 Ω between the ground circuit terminal 24 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 23 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the S146 Window/Outside Rearview Mirror Switch-Driver.
    - **If the test lamp illuminates**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 24.

NOTE: **Leaving the 3 A fused jumper wire connected between the signal circuit and ground for greater than 60 sec will cause the scan tool Driver Window Main Control Down Switch parameter to change from Active to Inactive**

6. Verify the scan tool Driver Window Main Control Down Switch parameter is Active
    - **If not Active**
    1. Vehicle OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the M74D Window Motor-Driver, Vehicle in Service Mode.
    2. Test for infinite resistance between the S146 Window/Outside Rearview Mirror Switch-Driver signal circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 1 V between the S146 Window/Outside Rearview Mirror Switch-Driver signal circuit terminal 1 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the M74D Window Motor-Driver.
    - **If Active**
7. Install a 3 A fused jumper wire between the signal circuit terminal 11 and the ground circuit terminal 24.

NOTE: **Leaving the 3 A fused jumper wire connected between the signal circuit and ground for greater than 60 sec will cause the scan tool Driver Window Main Control Up Switch parameter to change from Active to Inactive**

8. Verify the scan tool Driver Window Main Control Up Switch parameter is Active
    - **If not Active**
    1. Vehicle OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the M74D Window Motor-Driver, Vehicle in Service Mode.
    2. Test for infinite resistance between the S146 Window/Outside Rearview Mirror Switch-Driver signal circuit terminal 11 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 1 V between the S146 Window/Outside Rearview Mirror Switch-Driver signal circuit 11 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the M74D Window Motor-Driver.
    - **If Active**
9. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the ground circuit terminal 24.

NOTE: **Leaving the 3 A fused jumper wire connected between the signal circuit and ground for greater than 60 sec will cause the scan tool Driver Window Main Control Express Switch parameter to change from Active to Inactive**

10. Verify the scan tool Driver Window Main Control Express Switch parameter is Active
    - **If not Active**
    1. Vehicle OFF, remove the 3 A fused jumper wire, disconnect the harness connector at the M74D Window Motor-Driver, Vehicle in Service Mode.
    2. Test for infinite resistance between the S146 Window/Outside Rearview Mirror Switch-Driver signal circuit terminal 5 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 1 V between the S146 Window/Outside Rearview Mirror Switch-Driver signal circuit 5 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    4. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the M74D Window Motor-Driver.
    - **If Active**
11. Test or replace the S146 Window/Outside Rearview Mirror Switch-Driver.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Front Side Door Window Switch Replacement
- Front Side Door Window Control Switch Replacement
- Rear Side Door Window Switch Replacement
- Front Side Door Window Regulator Replacement
- Rear Side Door Window Regulator Replacement

DTC B3205: DRIVER WINDOW MOTOR CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptors

DTC B3205

Driver Window Motor Circuit

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When a window switch is pressed on the driver window switch, a serial data message is sent to the body control module (BCM). The BCM examines the request and checks for messages from other power window motors prohibiting the window movement. If no prohibitive messages have been received, the BCM will send a serial data message to the passenger window motor or to the appropriate rear window switch which will perform the command as requested.

Conditions for Running the DTC

- The ignition switch is in the ON position.
- Battery voltage must be between 9 - 16 V.

Conditions for Setting the DTC

B3205 00

The BCM has detected that the compatibility code stored in the driver window motor does not match the compatibility code stored in the BCM.

B3205 39

An internal malfunction has been detected by the BCM in the driver window motor while commanding the window UP or DOWN.

B3205 42

The BCM will automatically attempt to download the calibration program into the driver window motor (As will occur when the window motor has been replaced), if the first calibration program fails to load, the BCM will attempt to download the calibration program a second time. If this download fails, the BCM will set DTC.

B3205 4B

The BCM detects that the driver window motor is "not normalized" which will occur under the following conditions:

- When the battery has been disconnected
- When the battery has been replaced
- When the door wiring harness has been disconnected
- When the window motor has been disconnected.

Action Taken When the DTC Sets

B3205 00, B3205 39, B3205 42

The driver motor will be inoperative.

B3205 4B

The driver motor will not perform the express up or express down functions and the driver information center will display Open, then Close Driver Window.

Conditions for Clearing the DTC

B3205 00

Installing a compatible window motor for that specific make and model vehicle.

B3205 39

The window motor must be replaced before the DTC can be cleared.

B3205 42

The window motor must be replaced before the DTC can be cleared.

B3205 4B

The window motor must be normalized before the DTC can be cleared.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Ignition ON
2. Verify the driver window functions while commanding the Driver Window Motor Up and Down with a scan tool.
    - **If the Up and Down functions do not work**

      Replace the M74D Window Motor - Driver.

    - **If the UP and DOWN functions works**
3. Verify the driver window performs the Express Up and Express Down functions with the S79D Window Switch-Driver.
    - **If the driver window does not Express Up and Express Down**

      Normalize the M74D Window Motor - Driver, refer to **Window Motor Programming - Express Function**.

  - **If the driver window performs the Express Up and Express Down functions**

4. Ignition OFF and all vehicle systems OFF. It may take up to 2 minutes for all vehicle systems to power down.
5. Ignition ON
6. Verify the driver window performs the Express Up and Express Down functions with the S79D Window Switch-Driver.
   - **If the driver window does not Express Up and Express Down**

     Replace the M74D Window Motor - Driver

   - **If the driver window performs the Express Up and Express Down functions**
7. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Front Side Door Window Regulator Replacement

SYMPTOMS - FIXED AND MOVEABLE WINDOWS

Important Preliminary Checks Before Starting:

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
   - There are no DTCs set.
   - The control modules can communicate via the serial data link.
2. Review the power window system operation or rear window defogger system operation in order to familiarize yourself with the system functions. Refer to the following:
   - **Rear Window Defogger Description and Operation**
   - **Power Windows Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the rear window defogger. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

NOTE:

- **Inspect for proper installation of electrical components if an intermittent condition exists. Inspect for aftermarket theft deterrent devices, lights, and cellular phones. Ensure that no aftermarket equipment is connected to the class 2 circuit. If you can not locate an intermittent condition, a cellular phone signal may cause the condition. Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .**
- **The problem may or may not turn ON the SERVICE VEHICLE SOON indicator or store a DTC. Do not use the symptom tables to diagnose intermittent conditions. The malfunction must be present in order to locate the problem.**

Poor electrical connections or wiring cause most intermittent conditions. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector body

- An improperly formed or damaged terminal
- Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension.
- Poor terminal to wire connection requires removing the terminal from the connector body in order to perform the check.

Use a scan tool in order to help detect intermittent conditions. The scan tool has several features that can be used to locate an intermittent condition. The snapshot feature can capture and store data parameters within the scan tool when the malfunction occurs. This information can then be reviewed in order to see what caused the malfunction.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Rear Window Defogger Malfunction**
- **Power Windows Malfunction**

REAR WINDOW DEFOGGER MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Relay B+	1	1	-	-
Relay Control	B0283 02	B0283 05	B0283 05	-
Rear Defogger Grid Control	1	1	2	-
Relay Ground	-	B0283 05	-	-
Rear Defogger Grid Ground	-	1	-	-
1. Rear Defogger Inoperative 2. Rear Defogger Always ON				

Circuit/System Description

When the HVAC control module receives a rear window defog request from the HVAC controls, the HVAC control module will supply voltage to the relay coil. Battery positive voltage is supplied at all times to the relay switched input and the relay coil is always grounded. This allows battery positive voltage from the relay switched input to flow through the switch contacts and out the relay switched output to the rear window defogger grid.

Diagnostic Aids

Rear window defogger indicator will still function when the switch is pressed but any of the following conditions may cause the rear window defogger not to function:

- Ambient temperature at the HVAC control module must be less than 10Ã‚Â°C (50Ã‚Â°F).
- System voltage is out of range.
- A DTC is set that disables rear window defogger functionality.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle ON.
2. Verify the scan tool Rear Defogger Switch parameter changes between On and Off when pressing the rear window defogger switch.
    - **If the parameter does not change between On and Off**

      Replace the A26 HVAC Controls.

    - **If the parameter changes between On and Off**
3. Verify the E18 Rear Defogger Grid turns ON and OFF when commanding the Rear Defogger On and Off with a scan tool.
    - **If the E18 Rear Defogger Grid does not turn ON and OFF**

      Refer to Circuit/System Testing

    - **If the E18 Rear Defogger Grid turns ON and OFF**
4. Verify the rear window defogger indicator turns ON and OFF when pressing the rear window defogger switch.
    - **If the indicator does not turn ON and OFF**

      Replace the A26 HVAC Controls.

    - **If the indicator turns ON and OFF**
5. All OK.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the KR5 Rear Defogger Relay. It may take up to 2 minutes for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 86 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.

    - **If the test lamp does not illuminate**
    - Replace the X50A Fuse Block-Underhood
    - **If the test lamp illuminates**

5. Connect a test lamp between the control circuit terminal 85 and the ground circuit terminal 86.
6. Verify the test lamp turns ON and OFF pressing the rear window defogger switch.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K33 HVAC Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K33 HVAC Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, remove the test lamp, disconnect the harness connector at the K33 HVAC Control Module, Vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K33 HVAC Control Module.
    - **If the test lamp turns ON and OFF**
7. Verify that a test lamp does not illuminate between the control circuit terminal 87 and ground.
    - **If the test lamp illuminates**

      Repair the short to voltage on the control circuit

    - **If the test lamp does not illuminate**
8. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the E18 Rear Defogger Grid. It may take up to 2 minutes for all vehicle systems to power down.
9. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
10. Connect the X2 harness connector at the E18 Rear Defogger Grid.
11. Vehicle in Service Mode, connect a 30 A fused jumper wire between the B+ circuit terminal 30 and the control circuit terminal 87.
12. Verify the E18 Rear Defogger Grid is activated.
    - **If the E18 Rear Defogger Grid does not activate**
    1. Vehicle OFF, remove the jumper wire, disconnect the harness connector at the E18 Rear Defogger Grid.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the E18 Rear Defogger Grid.
    - **If the E18 Rear Defogger Grid activates**
13. Test or replace the KR5 Rear Defogger Relay.

Component Testing

Relay Test

1. Vehicle OFF, disconnect the KR5 Rear Defogger Relay.
2. Test for 60-180 Ω between terminals 85 and 86.
   - **If less than 60 Ω or greater than 180 Ω**

     Replace the KR5 Rear Defogger Relay.

   - **If between 60-180 Ω**
3. Test for infinite resistance between the terminals listed below:
   - 30 and 86
   - 30 and 87
   - 30 and 85
   - 85 and 87
   - **If less than infinite resistance**

     Replace the KR5 Rear Defogger Relay.

   - **If infinite resistance**
4. Install a 3 A fused jumper wire between relay terminal 86 and 12 V. Install a jumper wire between relay terminal 85 and ground.
5. Test for less than 2 Ω between terminals 30 and 87.
   - **If 2 Ω or greater**

     Replace the KR5 Rear Defogger Relay.

   - **If less than 2 Ω**
6. All OK

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- **Rear Window Replacement**
- **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**
- **Control Module References** for HVAC control module and HVAC controls replacement, programming and setup

POWER WINDOWS MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

Circuit/System Description

For an overview of the component/system, refer to: Power Windows Description and Operation

Circuit	Description
B+ - M74D Window Motor - Driver	Supplied from a fuse.
B+ - M74P Window Motor - Passenger	Supplied from a fuse.

Circuit	Description
B+ - S79LR Window Switch - Left Rear	Supplied from a fuse.
B+ - S79RR Window Switch - Right Rear	Supplied from a fuse.
Power Window Switch Driver Down Signal	The output circuit is switched to ground to activate the component.
Power Window Switch Driver Express Signal	The output circuit is switched to ground to activate the component.
Power Window Switch Driver Up Signal	The output circuit is switched to ground to activate the component.
Power Window Motor Passenger Down Control	The output circuit is switched from ground to 12 V to activate the component.
Power Window Motor Passenger Up Control	The output circuit is switched from ground to 12 V to activate the component.
Power Window Motor Left Rear Up Control	The output circuit is switched from ground to 12 V to activate the component.
Power Window Motor Left Rear Down Control	The output circuit is switched from ground to 12 V to activate the component.
Power Window Motor Right Rear Up Control	The output circuit is switched from ground to 12 V to activate the component.
Power Window Motor Right Rear Down Control	The output circuit is switched from ground to 12 V to activate the component.
Ground	Chassis Ground

Component	Description
S146 Window/Outside Rearview Mirror Switch - Driver	The S146 sends a serial data message to the K9 indicating the M74 function that has been requested.
M74D Window Motor - Driver	• Power Window Control • The control module and the DC motor are one assembly.
S79P Window Switch - Passenger	The switch has a normally open contact.
M74P Window Motor - Passenger	An electric DC motor.
S79LR Window Switch - Left Rear	The switch has a normally open contact.
M74LR Window Motor - Left Rear	An electric DC motor.
S79RR Window Switch - Right Rear	The switch has a normally open contact.
M74RR Window Motor - Right Rear	An electric DC motor.
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc.

Diagnostic Aids

M74D Window Motor - Driver - Window Express Up System Not Initialized

- Battery - Disconnected/Replaced
- Front Side Door Wiring Harness - Disconnected
- M74 Window Motor - Disconnected

M74D Window Motor - Driver - Normalized - **Window Motor Programming - Express Function**

Control Module References

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode
2. Perform the scan tool control function: Driver Window Motor - Up & Down

   Verify the component operates in both directions: M74D Window Motor - Driver

   - **If not the specified state**

     Refer to: Circuit/System Testing - Test 1

   - **If the specified state**
3. Operate the component: Driver Left Front Window Switch - Pressed & Pulled

   Verify the component works as specified: M74D Window Motor - Driver = Up/Express Up /Down/Express Down

   - **If not the specified state**

     Refer to: Circuit/System Testing - Test 2

   - **If the specified state**
4. S146 Window/Outside Rearview Mirror Switch - Driver - Not Pressed

   Verify the scan tool parameter:

   - Left Rear Window Main Control Down Switch = Inactive
   - Left Rear Window Main Control Express Switch = Inactive
   - Left Rear Window Main Control Up Switch = Inactive
   - Right Rear Window Main Control Down Switch = Inactive
   - Right Rear Window Main Control Express Switch = Inactive
   - Right Rear Window Main Control Up Switch = Inactive
   - Front Passenger Window Main Control Down Switch = Inactive
   - Front Passenger Window Main Control Express Switch = Inactive
   - Front Passenger Window Main Control Up Switch = Inactive
   - **If not the specified state**

     Test or replace the component: S146 Window/Outside Rearview Mirror Switch - Driver

   - **If the specified state**
5. Operate the component: S146 Window/Outside Rearview Mirror Switch - Driver-Left Rear Window Switch - Pressed & Pulled

Verify the scan tool parameter:

- Left Rear Window Main Control Down Switch = Active
- Left Rear Window Main Control Express Switch = Active
- Left Rear Window Main Control Up Switch = Active
- **If not the specified state**

  Test or replace the component: S146 Window/Outside Rearview Mirror Switch - Driver

- **If the specified state**

6. Operate the component: S146 Window/Outside Rearview Mirror Switch - Driver-Right Rear Window Switch - Pressed & Pulled

   Verify the scan tool parameter:

   - Right Rear Window Main Control Down Switch = Active
   - Right Rear Window Main Control Express Switch = Active
   - Right Rear Window Main Control Up Switch = Active
   - **If not the specified state**

     Test or replace the component: S146 Window/Outside Rearview Mirror Switch - Driver

   - **If the specified state**

7. Operate the component: S146 Window/Outside Rearview Mirror Switch - Driver-Right Front Window Switch - Pressed & Pulled

   Verify the scan tool parameter:

   - Front Passenger Window Main Control Down Switch = Active
   - Front Passenger Window Main Control Express Switch = Active
   - Front Passenger Window Main Control Up Switch = Active
   - **If not the specified state**

     Test or replace the component: S146 Window/Outside Rearview Mirror Switch - Driver

   - **If the specified state**

8. Perform the scan tool control function: Passenger Window Motor - Up & Down

   Verify the component works as specified: M74P Window Motor - Passenger = Up & Down

   - **If not the specified state**

     Refer to: Circuit/System Testing - Test 3

   - **If the specified state**

9. Perform the scan tool control function: Left Rear Window Motor - Up & Down

   Verify the component works as specified: M74LR Window Motor - Left Rear = Up & Down

   - **If not the specified state**

     Refer to: Circuit/System Testing - Test 3

   - **If the specified state**

10. Perform the scan tool control function: Right Rear Window Motor - Up & Down

    Verify the component works as specified: M74RR Window Motor - Right Rear = Up & Down

    - **If not the specified state**

Refer to: Circuit/System Testing - Test 3

- **If the specified state**

11. All OK.

Circuit/System Testing

Test 1

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: M74D Window Motor - Driver
3. Test for less than 10 Ω between the test points: Ground circuit terminal 1 & Ground
   - **If 10 Ω or greater**
   1. Ground Connection - Disconnect
   2. Test for less than 2 Ω between the test points: Ground circuit terminal 1 at Component harness & Ground Connection
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Verify a test lamp turns On between the test points: B+ circuit terminal 2 & Ground
   - **If the test lamp does not turn On and the circuit fuse is OK**
   1. Ignition/Vehicle - Off & Remove - Test lamp
   2. Test for less than 2 Ω between the test points: M74D Window Motor - DriverB+ circuit terminal 2 at Output terminal at F28UA Fuse
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not turn On and the circuit fuse is open**
   1. Ignition/Vehicle - Off & Remove - Test lamp
   2. Test for infinite resistance between the test points: B+ circuit terminal 2 & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance - Replace the component: M74D Window Motor - Driver
   - **If the test lamp turns On**
6. Test or replace the component: M74D Window Motor - Driver

Test 2

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: S146 Window/Outside Rearview Mirror Switch - Driver
3. Test for less than 10 Ω between the test points: Ground circuit terminal 24 & Ground
   - **If 10 Ω or greater**
   1. Ground Connection - Disconnect
   2. Test for less than 2 Ω between the test points: Ground circuit terminal 24 at Component harness & Ground Connection
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Repair the open/high resistance in the ground connection.

   - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Verify a test lamp turns On between the test points: B+ circuit terminal 23 & Ground
   - **If the test lamp does not turn On and the circuit fuse is OK**
     1. Ignition/Vehicle - Off & Remove - Test lamp
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not turn On and the circuit fuse is open**
     1. Ignition/Vehicle - Off & Remove - Test lamp
     2. Test for infinite resistance between the test points: B+ circuit terminal 23 & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance - Replace the component: S146 Window/Outside Rearview Mirror Switch - Driver
   - **If the test lamp turns On**
6. Verify the scan tool parameter: Driver Window Main Control Down Switch = Inactive
   - **If not the specified state**
     1. Ignition/Vehicle - Off
     2. Disconnect the electrical connector: M74D Window Motor - Driver
     3. Test for infinite resistance between the test points: Signal circuit terminal 1 at Component harness & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance - Replace the component: M74D Window Motor - Driver
   - **If the specified state**
7. Momentarily connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 24

   Verify the scan tool parameter: Driver Window Main Control Down Switch = Active

   - **If not the specified state**
     1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
     2. Disconnect the electrical connector: M74D Window Motor - Driver
     3. Ignition - On / Vehicle - In Service Mode
     4. Test for less than 1 V between the test points: Signal circuit terminal 1 at Component harness & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V
     5. Ignition/Vehicle - Off
     6. Test for less than 2 Ω between the test points: Signal circuit terminal 1 at Component harness & Terminal 7 at M74D Window Motor - Driver
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Replace the component: M74D Window Motor - Driver
   - **If the specified state**
8. Verify the scan tool parameter: Driver Window Main Control Up Switch = Inactive
   - **If not the specified state**
     1. Ignition/Vehicle - Off
     2. Disconnect the electrical connector: M74D Window Motor - Driver
     3. Test for infinite resistance between the test points: Signal circuit terminal 11 at Component harness & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance - Replace the component: M74D Window Motor - Driver
   - **If the specified state**

9. Momentarily connect a 3 A fused jumper wire between the test points: Signal circuit terminal 11 & Ground circuit terminal 24

   Verify the scan tool parameter: Driver Window Main Control Up Switch = Active

   - **If not the specified state**
   1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
   2. Disconnect the electrical connector: M74D Window Motor - Driver
   3. Ignition - On / Vehicle - In Service Mode
   4. Test for less than 1 V between the test points: Signal circuit terminal 11 at Component harness & Ground
      - If 1 V or greater - Repair the short to voltage on the circuit.
      - If less than 1 V
   5. Ignition/Vehicle - Off
   6. Test for less than 2 Ω between the test points: Signal circuit terminal 11 at Component harness & Terminal 3 at M74D Window Motor - Driver
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Replace the component: M74D Window Motor - Driver
   - **If the specified state**
10. Test for greater than 10 V between the test points: Signal circuit terminal 5 at Component harness & Ground
   - **If 10 V or less**
   1. Ignition/Vehicle - Off
   2. Disconnect the electrical connector: M74D Window Motor - Driver
   3. Test for infinite resistance between the test points: Signal circuit terminal 5 at Component harness & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If less than infinite resistance
   1. Ignition/Vehicle - Off
   2. Test for less than 2 Ω between the test points: Signal circuit terminal 11 at Component harness & Signal circuit terminal 3 at M74D Window Motor - Driver
   - If 2 Ω or greater - Repair the open/high resistance in the circuit.
   - If less than 2 Ω - Replace the component: M74D Window Motor - Driver
   - **If the specified state**
11. Test or replace the component: S146 Window/Outside Rearview Mirror Switch - Driver

Test 3

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector: S79P Window Switch - Passenger/S79LR Window Switch - Left Rear/S79RR Window Switch - Right Rear
3. Test for less than 10 Ω between the test points: Ground circuit terminal 7 & Ground
   - **If 10 Ω or greater**
   1. Ground Connection - Disconnect
   2. Test for less than 2 Ω between the test points: Ground circuit terminal 7 at Component harness & Ground Connection
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**

4. Ignition - On / Vehicle - In Service Mode
5. Verify a test lamp turns On between the test points: B+ circuit terminal 8 & Ground
   - **If the test lamp does not turn On and the circuit fuse is OK**
   1. Ignition/Vehicle - Off & Remove - Test lamp
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Verify the fuse is OK and there is voltage at the fuse.
   - **If the test lamp does not turn On and the circuit fuse is open**
   1. Ignition/Vehicle - Off & Remove - Test lamp
   2. Test for infinite resistance between the test points: B+ circuit terminal 8 & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance - Replace the component: S79 Window Switch
   - **If the test lamp turns On**
6. Ignition/Vehicle - Off
7. Connect the electrical connector. S79 Window Switch
8. Disconnect the electrical connector: M74 Window Motor
9. Connect a test lamp between the test points: Control circuit terminal 1 & Control circuit terminal 2
10. Ignition - On / Vehicle - In Service Mode
11. Perform the scan tool control function: Window Motor

    Verify the test lamp state:

    Window Motor - Stop = Test lamp Off

    Window Motor - Up = Test lamp On

    Window Motor - Down = Test lamp On

   - **If not the specified state**
   1. Ignition/Vehicle - Off & Remove - Test lamp
   2. Disconnect the electrical connector: S79 Window Switch
   3. Ignition - On / Vehicle - In Service Mode
   4. Test for less than 1 V between the test points:
      - Control circuit terminal 1 at Component harness & Ground
      - Control circuit terminal 2 at Component harness & Ground
      - If 1 V or greater - Repair the short to voltage on the circuit.
      - If less than 1 V
   5. Ignition/Vehicle - Off
   6. Test for infinite resistance between the test points:
      - Control circuit terminal 1 at Component harness & Ground
      - Control circuit terminal 2 at Component harness & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance
   7. Test for less than 2 Ω between the test points:
      - Control circuit terminal 1 at Component harness & Control circuit terminal 10 at S79 Window Switch
      - Control circuit terminal 2 at Component harness & Control circuit terminal 9 at S79 Window Switch
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Replace the component: S79 Window Switch
   - **If the specified state**
12. Test or replace the component: M74 Window Motor

Component Testing

M74P Window Motor - Passenger/M74LR Window Motor - Left Rear/M74RR Window Motor - Right Rear

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector:
    - M74P Window Motor - Passenger
    - M74LR Window Motor - Left Rear
    - M74RR Window Motor - Right Rear
3. Connect a 25 A fused jumper wire between the test points: Control terminal 1 & B+

    CAUTION: **Complete the testing as quickly as possible in order to prevent overheating and damaging the component.**

4. Momentarily connect a jumper wire between the test points: Control terminal 2 & Ground

    Reverse the jumper wires 2 times between the terminals.

    Verify the component works as specified: M74 Window Motor = Up & Down

    - **If not the specified state**

        Replace the component:

    - M74P Window Motor - Passenger
    - M74LR Window Motor - Left Rear
    - M74RR Window Motor - Right Rear
    - **If the specified state**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: Diagnostic Repair Verification

- Front Side Door Window Switch Replacement
- Front Side Door Window Control Switch Replacement
- Rear Side Door Window Switch Replacement
- Front Side Door Window Regulator Replacement
- Rear Side Door Window Regulator Replacement

REPAIR INSTRUCTIONS

WINDSHIELD REPLACEMENT

Special Tools

- **BO-24402-A** Glass Sealant Remover (Cold Knife).
- **BO-39032** Stationary Glass Removal Tool, or equivalent in order to remove the window.
- Use a urethane adhesive systems which meet GM Specification GM 3651G

Equivalent regional tools: Special Tools

Removal Procedure

NOTE: **Before cutting out a stationary window, apply a double layer of masking tape around the perimeter of the painted surfaces and the interior trim.**

1. Open the hood.
2. Battery Negative Cable - Disconnect - **Battery Negative Cable Disconnection and Connection**

Courtesy of GENERAL MOTORS COMPANY

6. Liftgate Emblem/Nameplate - Remove -

   Liftgate Emblem/Nameplate Replacement (Emblem) **Liftgate Emblem/Nameplate Replacement (Nameplate)**

7. Disconnect the rear window grid electrical connectors.

WARNING: **If broken glass falls into the defroster outlets, it can be blown into the passenger compartment and cause personal injury.**

8. Cover to protect the following parts from broken glass:
    - Seats and carpeting

WARNING: **Refer to Glass and Sheet Metal Handling Warning .**

9. Using the appropriate tool, carefully cut around the lace, start in the center working from side to side of the window to access the urethane adhesive bead, if equipped.

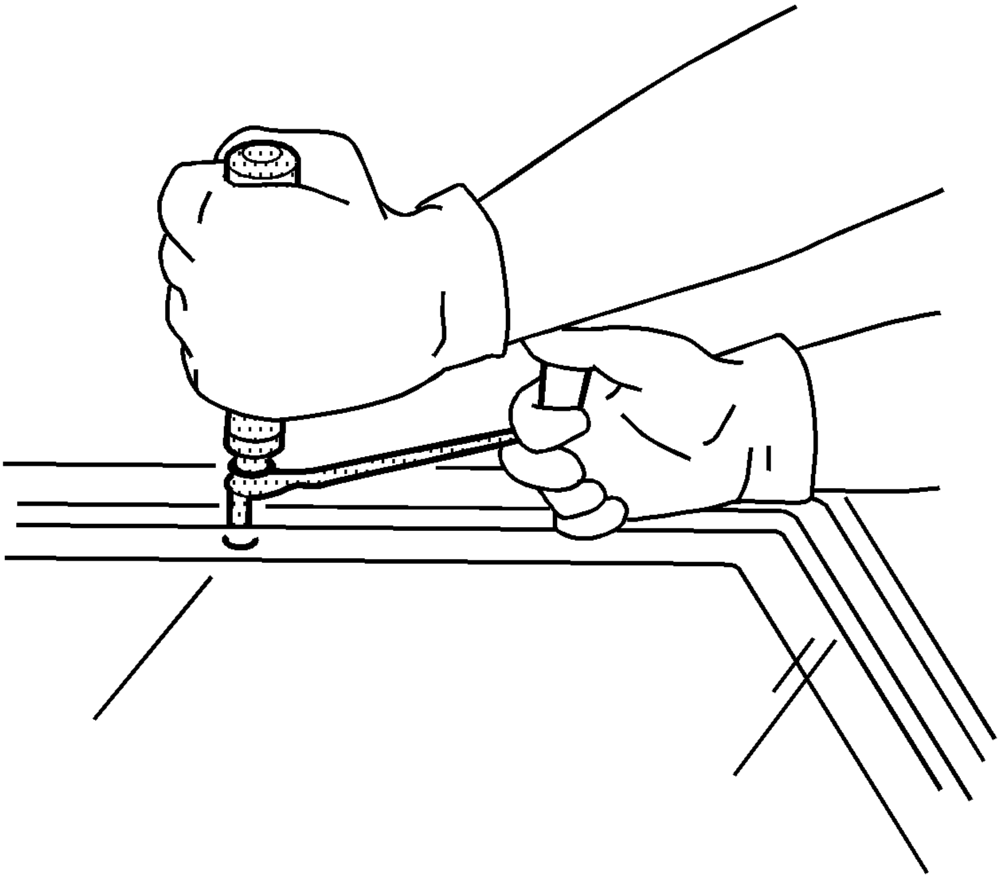

Fig. 37: Separating Urethane Adhesive From Window
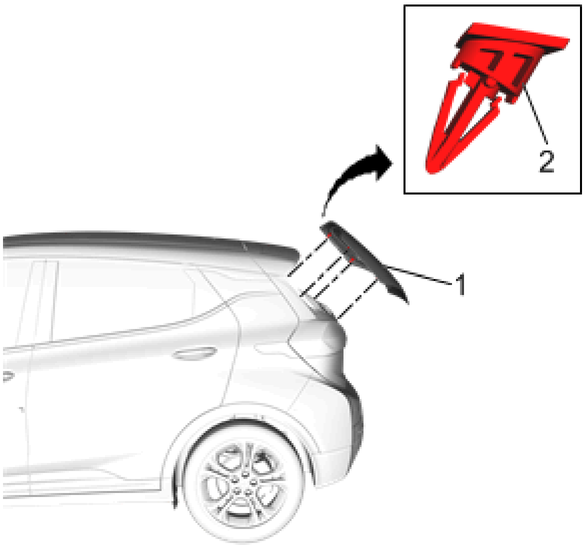
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Keep the cutting edge of the tool against the window.**

10. This will allow the urethane adhesive to be separated from the window.
    - Leave a base of urethane on the pinchweld flange.
    - The only suitable lubrication is clear water.
    - **BO-24402-A** Glass Sealant Remover (Cold Knife).
    - **BO-39032** Stationary Glass Removal Tool, or equivalent in order to remove the window.



[Fig. 38: Rear Window And Locating Pin](#)
Courtesy of GENERAL MOTORS COMPANY

11. With the aid of an assistant lift the rear window (1) and locating pin (2) from vehicle.

Installation Procedure

1. Rear Window - Install - **Adhesive Installation of Rear Windows**
2. Connect the rear window grid electrical connectors.

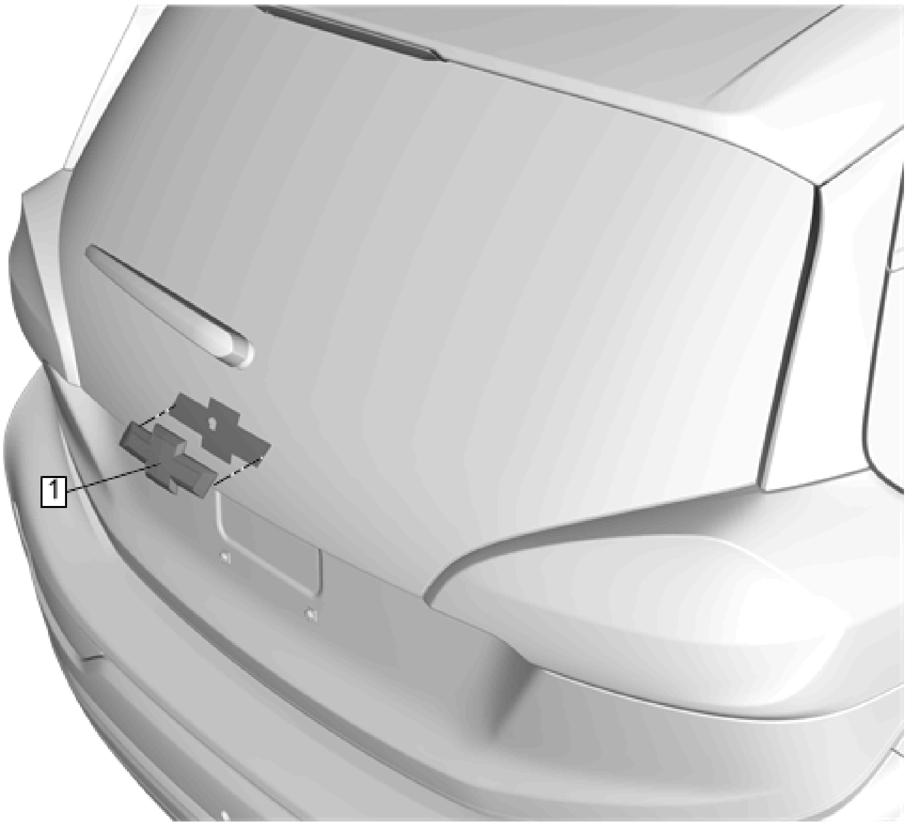


Fig. 39: Liftgate Emblem/Nameplate (Emblem)
Courtesy of GENERAL MOTORS COMPANY

3. Liftgate Emblem/Nameplate - Install -

Liftgate Emblem/Nameplate Replacement (Emblem) Liftgate Emblem/Nameplate Replacement (Nameplate)

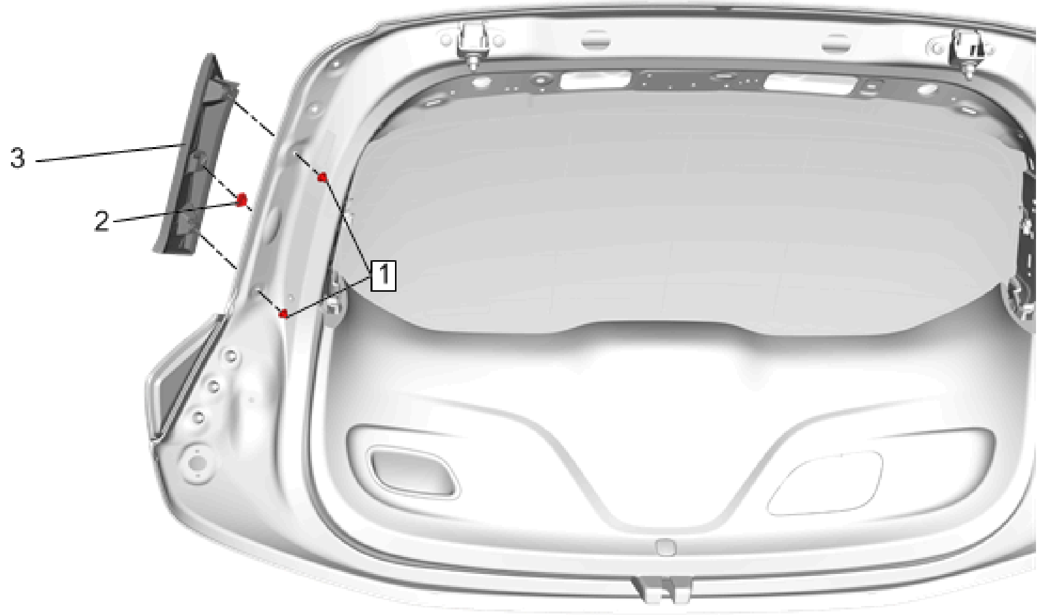

Fig. 40: Body Side Upper Rear Applique

6. Rear Window Wiper Motor - Install - **Rear Window Wiper Motor Replacement**
7. Battery Negative Cable - Connect - **Battery Negative Cable Disconnection and Connection**
8. Rear compartment lid - Close
9. Double layer of masking tape around the perimeter of the painted surfaces and the interior trim - Remove

WINDSHIELD PILLAR STATIONARY WINDOW REPLACEMENT

Special Tools

- **BO-24402-A** Glass Sealant Remover (Cold Knife).
- **BO-39032** Stationary Glass Removal Tool, or equivalent in order to remove the window.
- Use a urethane adhesive systems which meet GM Specification GM 3651G

Special Tools

Removal Procedure

WARNING: **If a window is cracked but still intact, crisscross the window with masking tape in order to reduce the risk of damage or personal injury.**

NOTE: **Before cutting out a stationary window, apply a double layer of masking tape around the perimeter of the painted surfaces and inner trim of the window.**

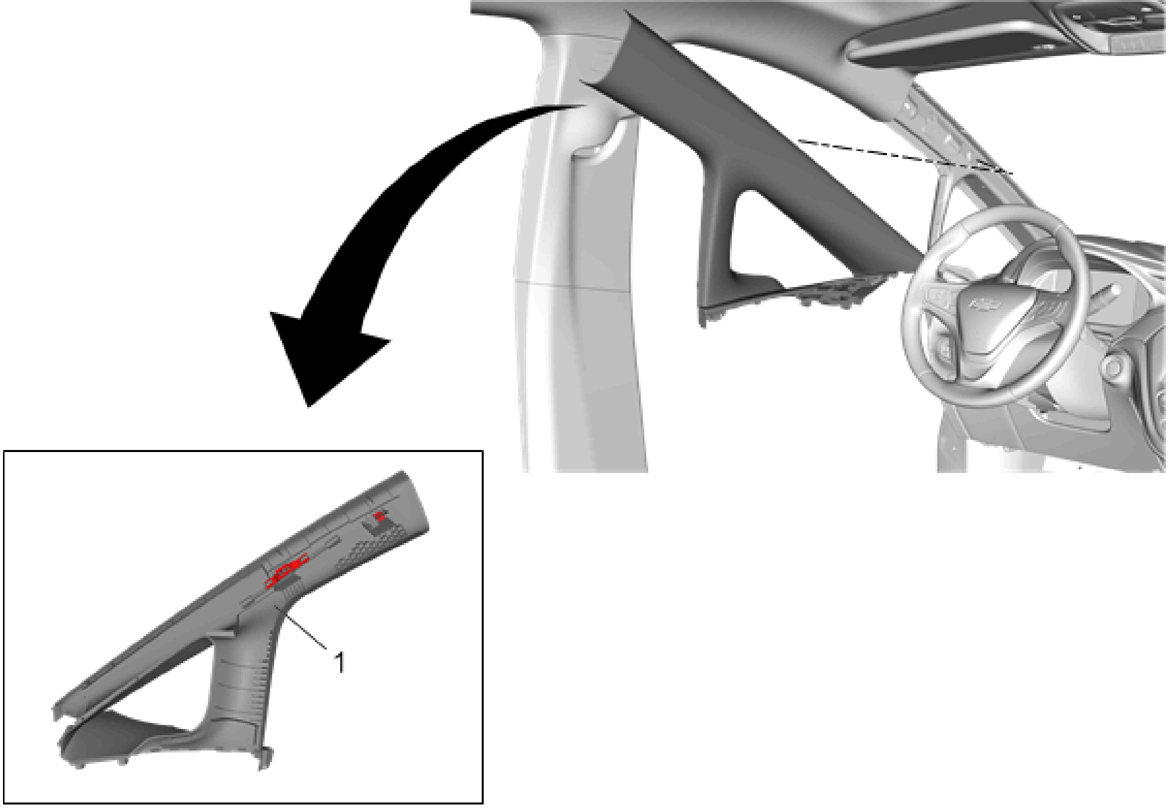

Fig. 43: Windshield Garnish Molding
Courtesy of GENERAL MOTORS COMPANY

1. Windshield Garnish Molding - Remove - Windshield Garnish Molding Replacement

WARNING: **If broken glass falls into the defroster outlets, it can be blown into the passenger compartment and cause personal injury.**

2. Cover to protect the following parts from broken glass:
    - Upper dash pad
    - Defroster outlets and A/C outlets
    - Seats and carpeting

WARNING: **Refer to Glass and Sheet Metal Handling Warning .**

NOTE: **Keep the cutting edge of the tool against the window. Do this from inside the vehicle to protect the outer painted surface.**

3. Carefully cut around the inside of the quarter modular window to expose the urethane adhesive bead.

    Use care not to damage the retainers. If the retainer get damaged it will be necessary to use mask tape to tape it in place while curing.

4. Keep the cutting edge of the tool against the inside of the window.

    This will allow the urethane adhesive to be separated from the window.

    - Leave a base of urethane on the pinch-weld flange.
    - The only suitable lubrication is clear water.
    - **BO-24402-A** Glass Sealant Remover (Cold Knife).
    - **BO-39032** Stationary Glass Removal Tool, or equivalent in order to remove the window.

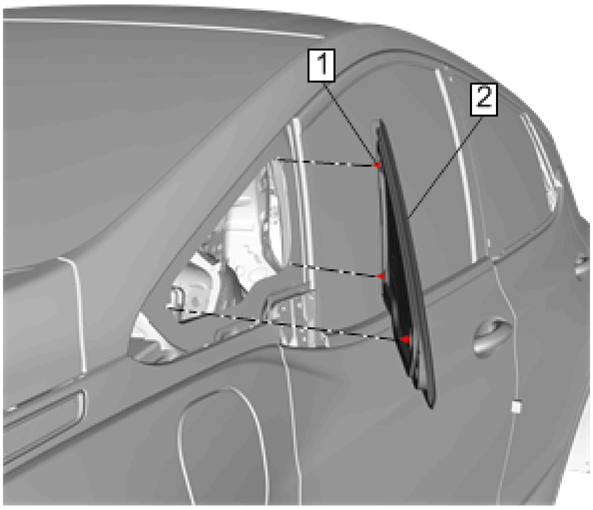

Fig. 44: Stationary Window
Courtesy of GENERAL MOTORS COMPANY

- Remove the stationary window (2) from the pinch-weld flange.

Installation Procedure

1. Windshield Pillar Stationary Window - Install - Adhesive Installation of Stationary Windows

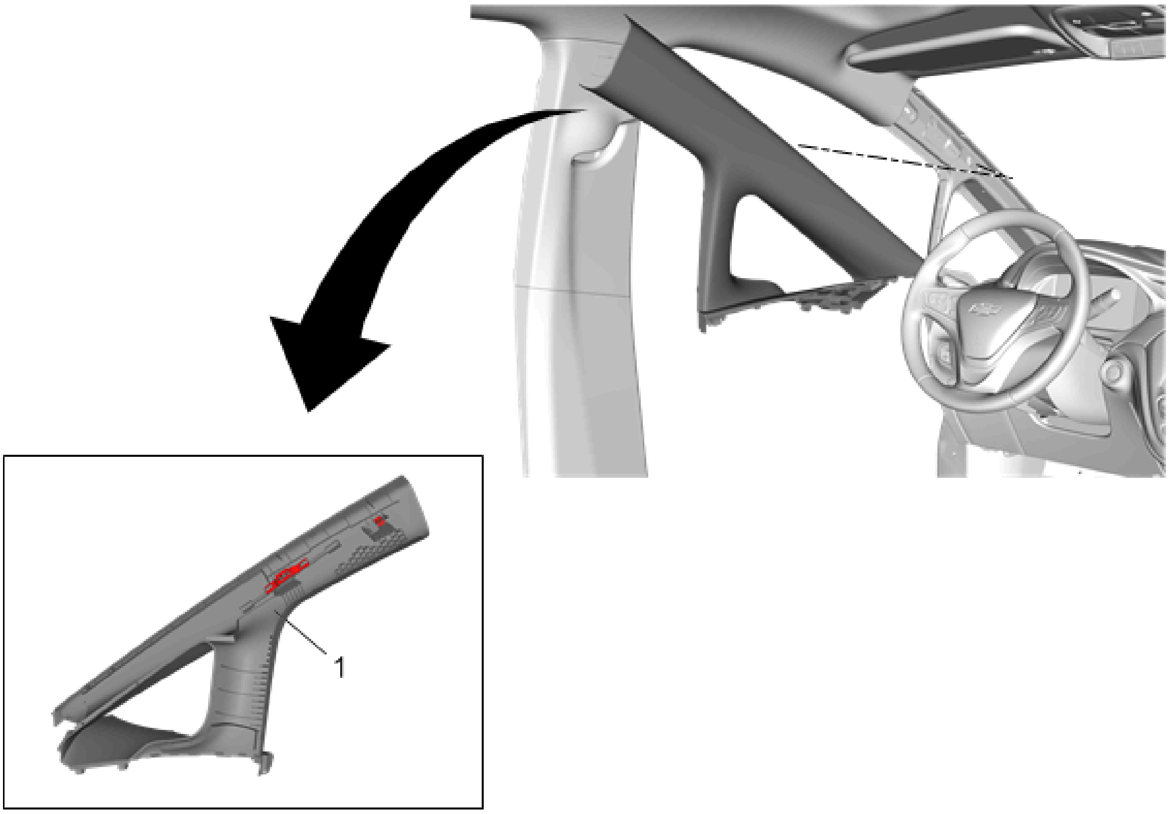

Fig. 45: Windshield Garnish Molding
Courtesy of GENERAL MOTORS COMPANY

2. Windshield Garnish Molding - Remove - Windshield Garnish Molding Replacement
3. Masking tape around the perimeter of the painted surfaces and the interior trim - Remove

FRONT SIDE DOOR WINDOW CONTROL SWITCH REPLACEMENT

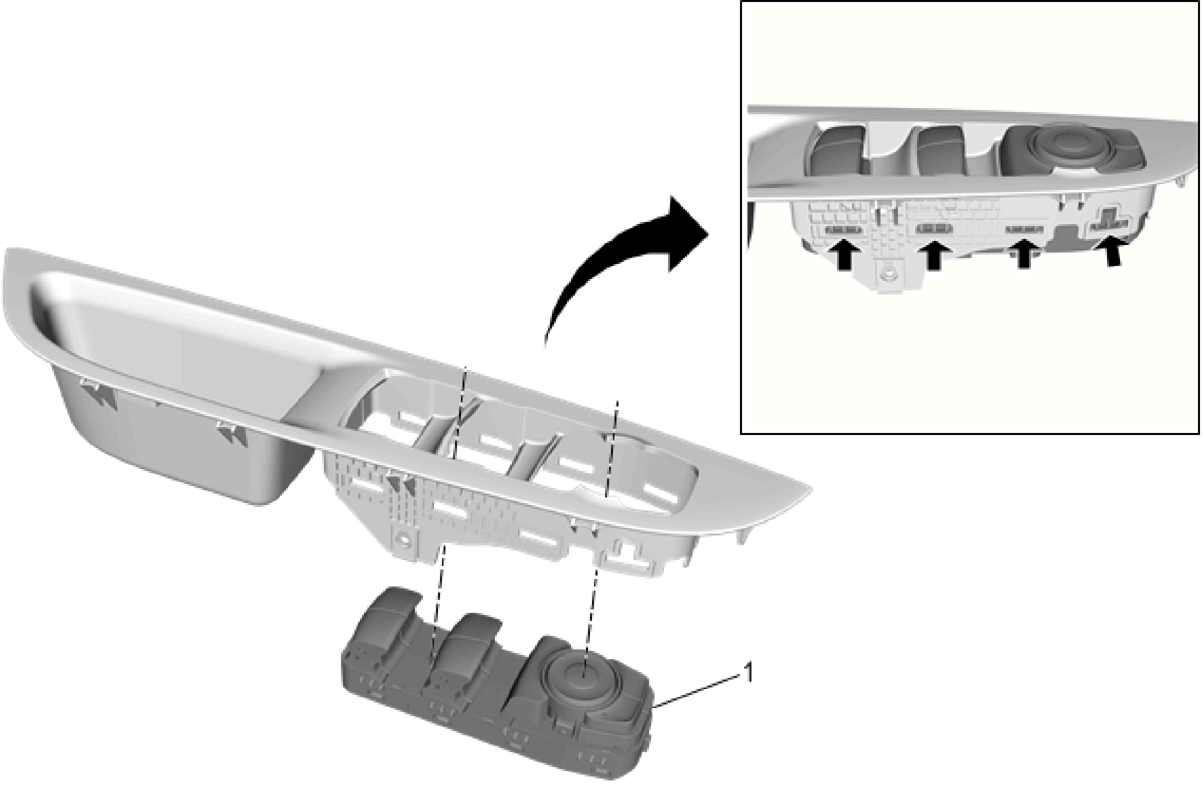

Fig. 46: Front Side Door Window Control Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure **Front Side Door Armrest Switch Mount Plate Replacement**	
1	Front Side Door Window Control Switch **Procedure** 1. Remove the J-nut from the mount plate. 2. Release the switch from the switch mount plate by depressing the tabs along each side of the switch.

FRONT SIDE DOOR WINDOW SWITCH REPLACEMENT

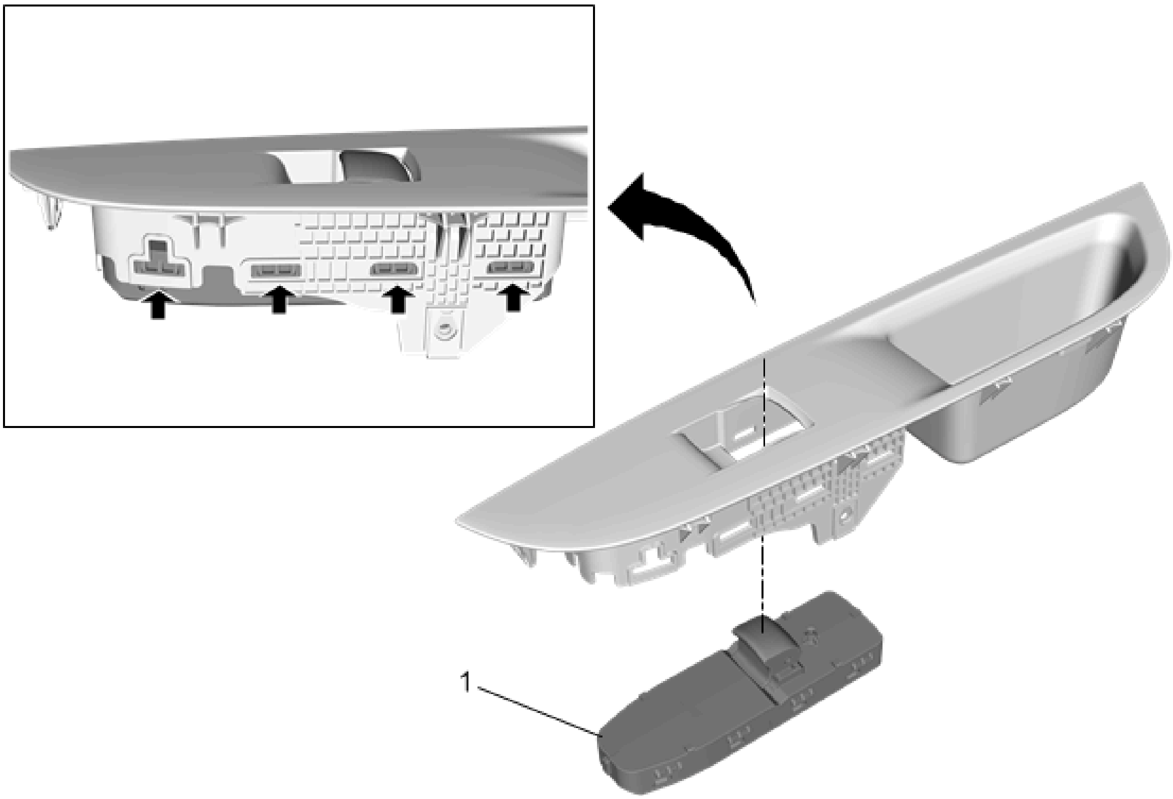

Fig. 47: Front Side Door Window Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Front Side Door Armrest Switch Mount Plate Replacement	
1	Front Side Door Window Switch **Procedure** 1. Remove the J-nut from the mount plate. 2. Release the switch assembly from the switch mount plate by depressing the tabs along each side of the switch.

REAR SIDE DOOR WINDOW SWITCH REPLACEMENT

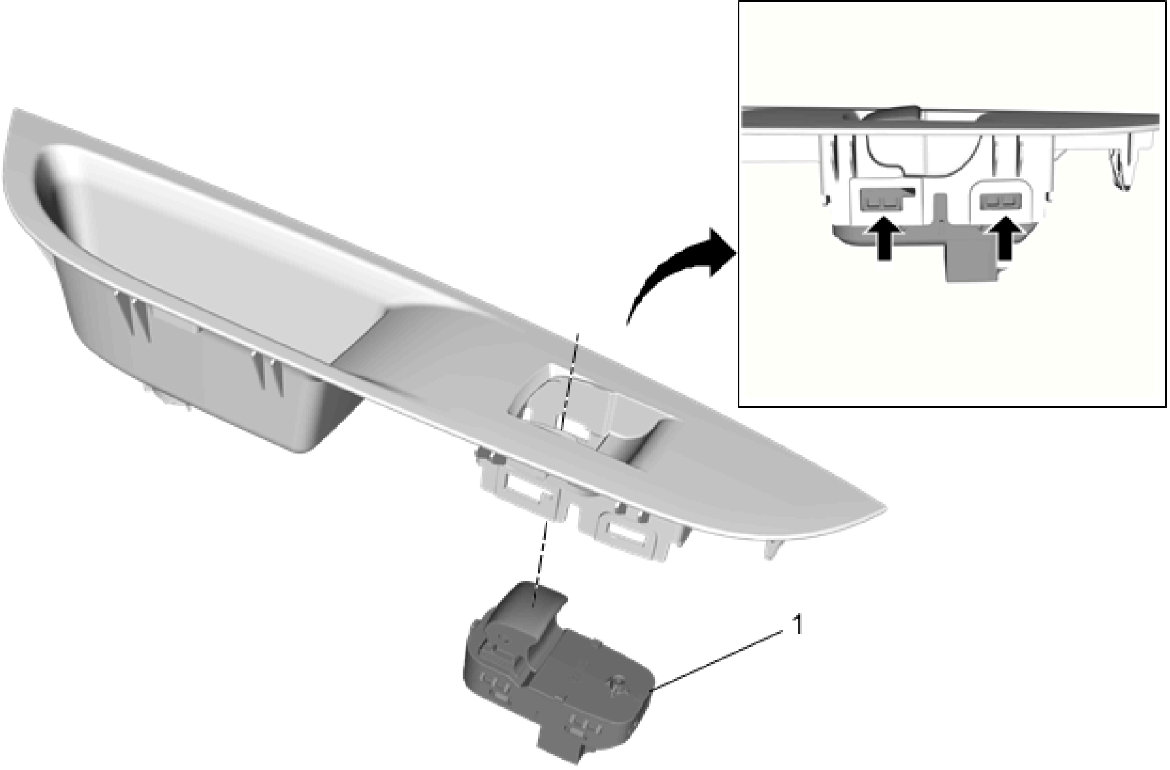

Fig. 48: Rear Side Door Window Switch
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Side Door Armrest Switch Mount Plate Replacement	
1	Rear Side Door Window Switch **Procedure** Release the switch assembly from the switch mount plate by depressing the tabs along each side of the switch.

FRONT SIDE DOOR WINDOW REGULATOR REPLACEMENT

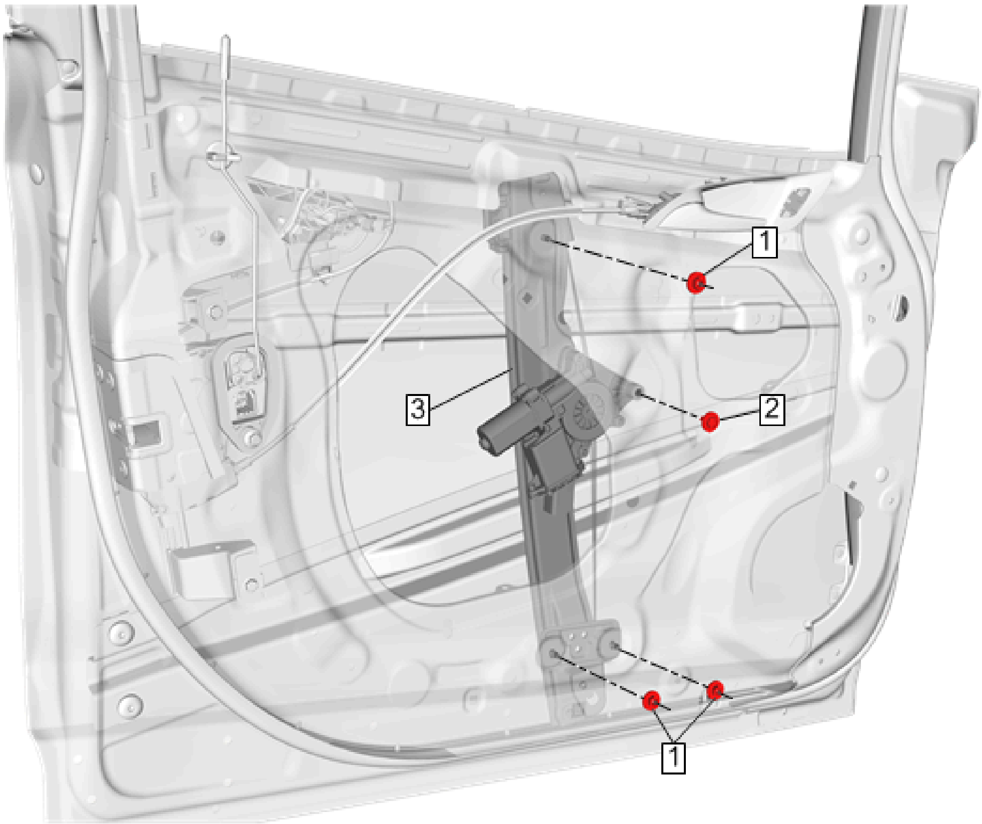

Fig. 49: Front Side Door Window Regulator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Glass and Sheet Metal Handling Warning **Preliminary Procedures** 1. Disconnect the window from the regulator. Front Side Door Window Replacement 2. Manually raise the window and tape in position.	
1	Front Side Door Window Regulator Nut (Qty: 3) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 11 N.m (97 lb in)
2	Front Side Door Window Regulator Bolt **Tighten** 11 N.m (97 lb in)
3	Front Side Door Window Regulator **Procedure** 1. Disconnect the electrical connector. 2. Inspect the door window for proper operation before installing the door trim panel. 3. Perform the window regulator motor program relearn. Window Motor Programming - Express Function

WINDOW MOTOR PROGRAMMING - EXPRESS FUNCTION

Window Motor Normalized Procedure

A window motor that has not been normalized will no longer perform the express up and express down functions, this may occur during the following conditions:

- When a window motor has been disconnected
- When a door harness has been disconnected
- When the battery has been disconnected or replaced

NOTE: **When DTC B3205 4B & 3210 4B are set, the following warnings will be displayed on the driver information center:**

Open, then Close Driver Window

Open, then Close Passenger Window

These warnings will clear once the windows have been "Normalized" and the respective DTC will clear.

To normalize the window motor, follow these steps:

NOTE: **The doors must be completely closed prior to normalizing the windows, a door that is open or ajar may cause the power window to function abnormally or to become inoperative while performing the**

normalizing procedure. If this occurs, verify that the door is completely closed then repeat the normalizing procedure.

1. Vehicle in Service Mode.
2. Starting with the window completely UP, press and hold the power window switch until the window is fully open and continue holding the switch down for approximately 5 seconds after the window is completely open.
3. Pull the power window switch up until the window is fully closed and continue holding the switch up for approximately 5 seconds after the window is completely closed.

The window should now be normalized and the window should perform the express up and express down functions.

Window Motor Relearn Procedure

A relearn procedure may need to be performed for any Local Interconnect Network (LIN) window motor for the following conditions:

- When the window glass is out of alignment
- When the window glass has been replaced
- When the door has been replaced
- When the window regulator has been replaced

NOTE: **Prior to performing the relearn procedure the vehicle must have all 4 wheels properly inflated and mounted, the vehicle must be sitting on a level surface and all doors must be completely closed.**

To relearn the window motor, follow these steps:

1. Vehicle in Service Mode.
2. With a scan tool, select Module Diagnosis, Body Control Module, Configuration/Reset Functions and then select the appropriate Clear Window Learn Values for the window motor requiring the relearn procedure.
3. After the learn procedure, exit the scan tool learn procedure completely, the power window cannot be normalized and will not function until you exit the program.
4. Starting with the window completely UP, press and hold the power window switch until the window is fully open and continue holding the switch down for approximately 5 seconds after the window is completely open.
5. Pull the power window switch up until the window is fully closed and continue holding the switch up for approximately 5 seconds after the window is completely closed.

The window is now reprogrammed.

REAR SIDE DOOR WINDOW REGULATOR REPLACEMENT

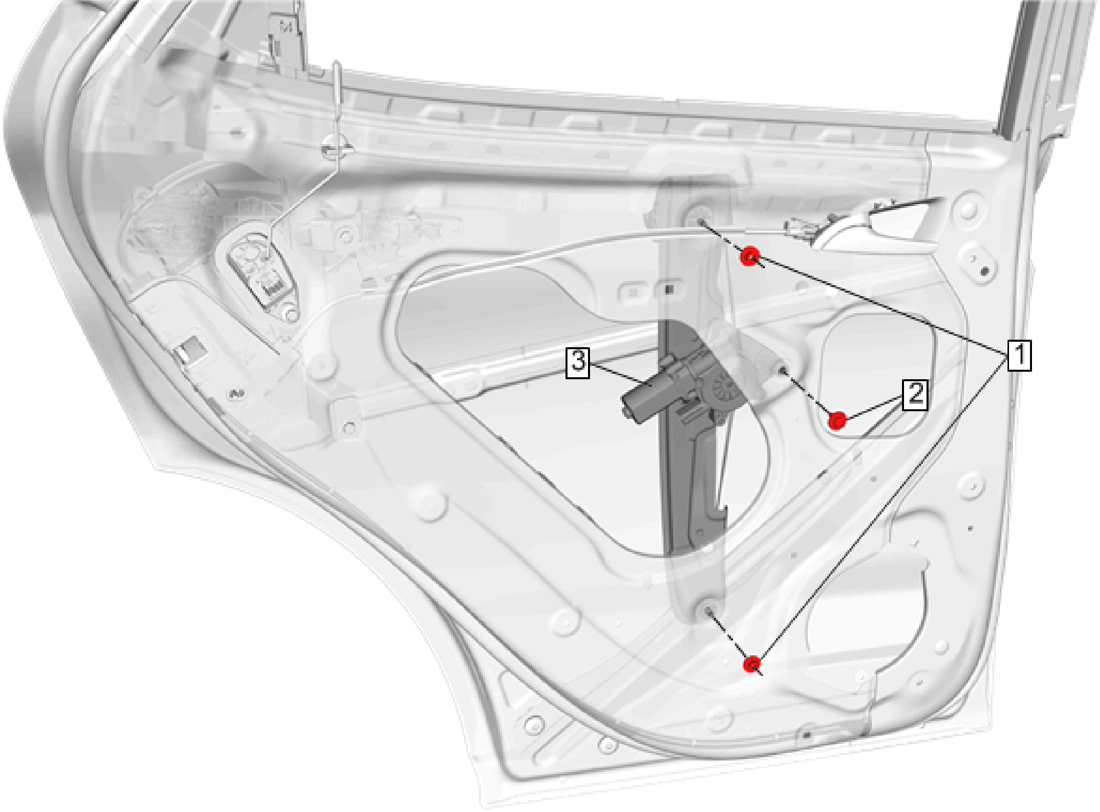

Fig. 50: Rear Side Door Window Regulator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Glass and Sheet Metal Handling Warning **Preliminary Procedures** 1. Disconnect the window from the regulator. Rear Side Door Window Replacement 2. Tape the window in the full up position.	
1	Rear Side Door Window Regulator Nut (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 11 N.m (97 lb in)
2	Rear Side Door Window Regulator Bolt **Tighten** 11 N.m (97 lb in)
3	Rear Side Door Window Regulator **Procedure** 1. Disconnect the electrical connector. 2. Inspect the door window for proper operation before installing the door trim panel. 3. Perform the window regulator motor program relearn. Window Motor Programming - Express Function

FRONT SIDE DOOR WINDOW CHANNEL RETAINER REPLACEMENT

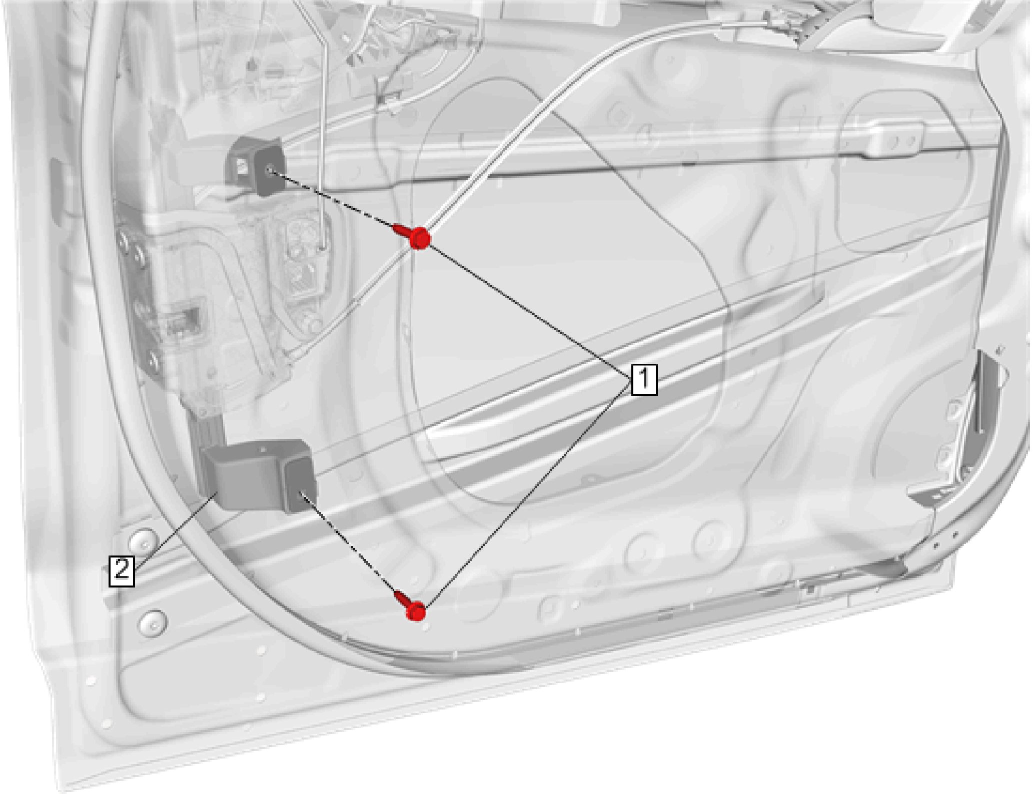

Fig. 51: Front Side Door Window Channel Retainer
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: Glass and Sheet Metal Handling Warning **WARNING:** **Disconnect the power window switch when working inside the door. When operated, the Express Up/Down Feature allows the door window to move very quickly, without stopping, which could cause personal injury.** **Preliminary Procedures** 1. Front Side Door Trim Replacement 2. Front Side Door Water Deflector Replacement	
1	Front Side Door Window Channel Retainer Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)
2	Front Side Door Window Channel Retainer **Procedure** Unclip the electrical harness from the window channel retainer.

FRONT SIDE DOOR WINDOW INNER SEALING STRIP REPLACEMENT

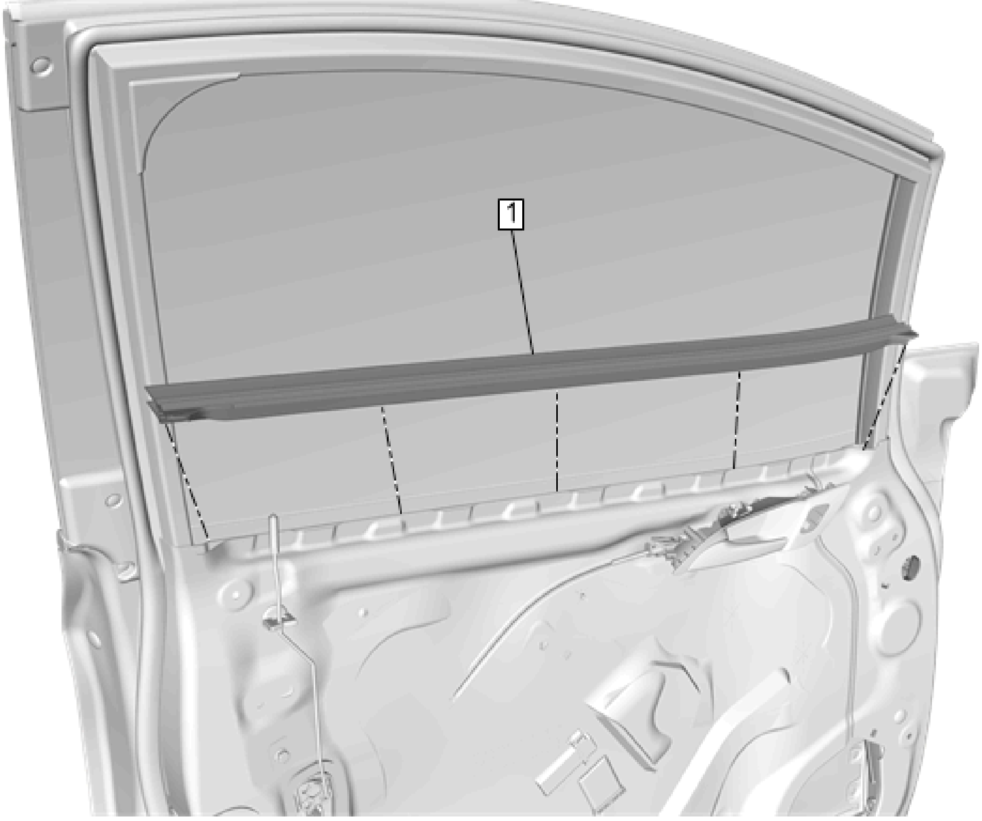

Fig. 52: Front Side Door Window Inner Sealing Strip
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures Front Side Door Trim Replacement	
1	Front Side Door Window Inner Sealing Strip **NOTE:** **The sealing strip will come off with the door trim panel. It will need to be removed from the trim panel. Trim panel clips should be installed back to the door and then install the sealing strip.**

REAR SIDE DOOR WINDOW UPPER REVEAL MOLDING REPLACEMENT

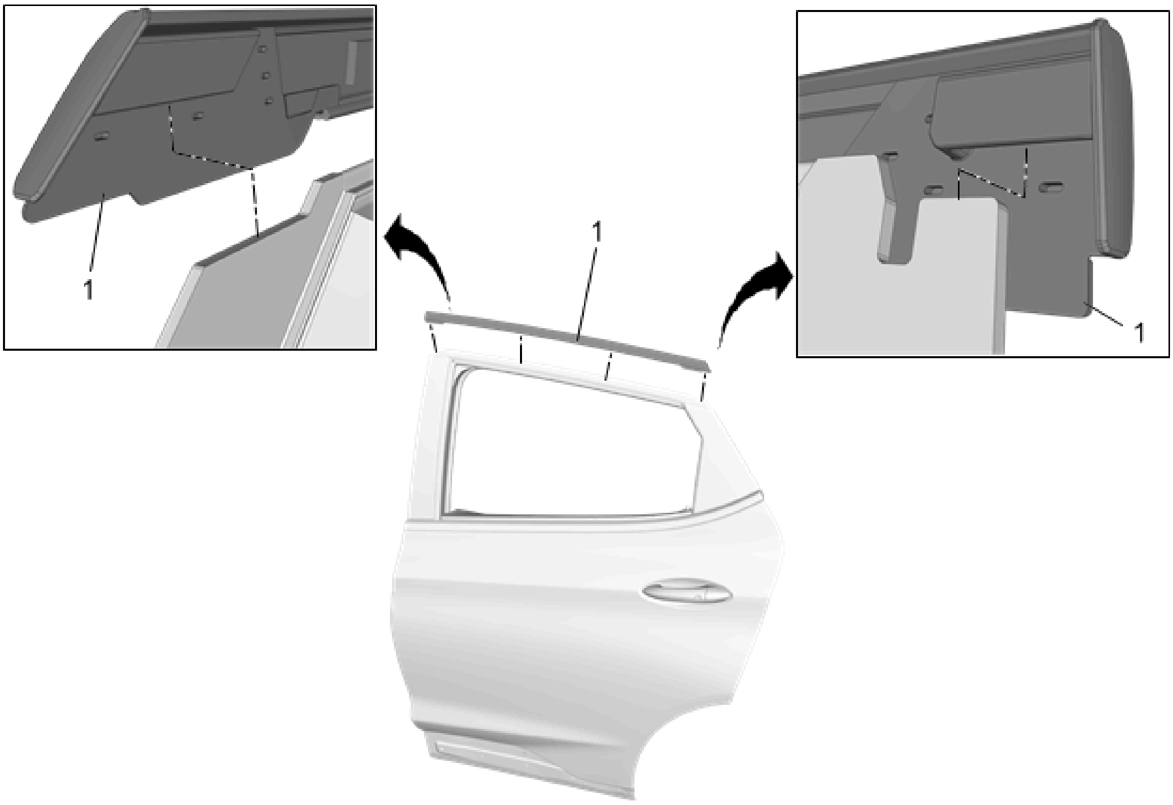

Fig. 53: Rear Side Door Window Upper Reveal Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Reposition the upper portion of the door side weatherstrip. Rear Side Door Weatherstrip Replacement - Door Side	
1	Rear Side Door Window Upper Reveal Molding **Procedure** Using the appropriate tool, release the upper reveal molding starting at the rear of the rear door.

REAR SIDE DOOR WINDOW BELT REVEAL MOLDING REPLACEMENT

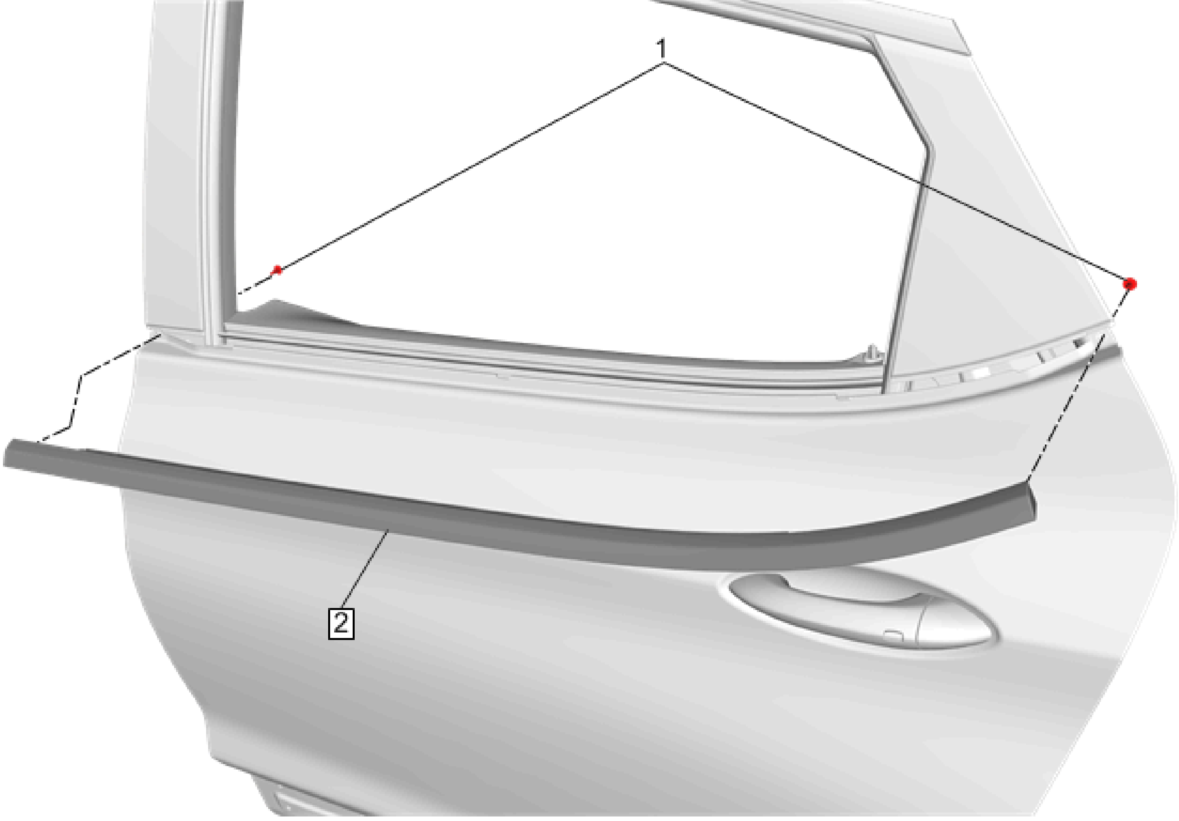

Fig. 54: Rear Side Door Window Belt Reveal Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures Release the rear side door weatherstrip to access the screw. **Rear Side Door Weatherstrip Replacement - Door Side**	
1	Rear Side Door Window Belt Reveal Molding Screw (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 1.5 N.m (13 lb in)
2	Rear Side Door Window Belt Reveal Molding

FRONT SIDE DOOR WINDOW BELT REVEAL MOLDING REPLACEMENT

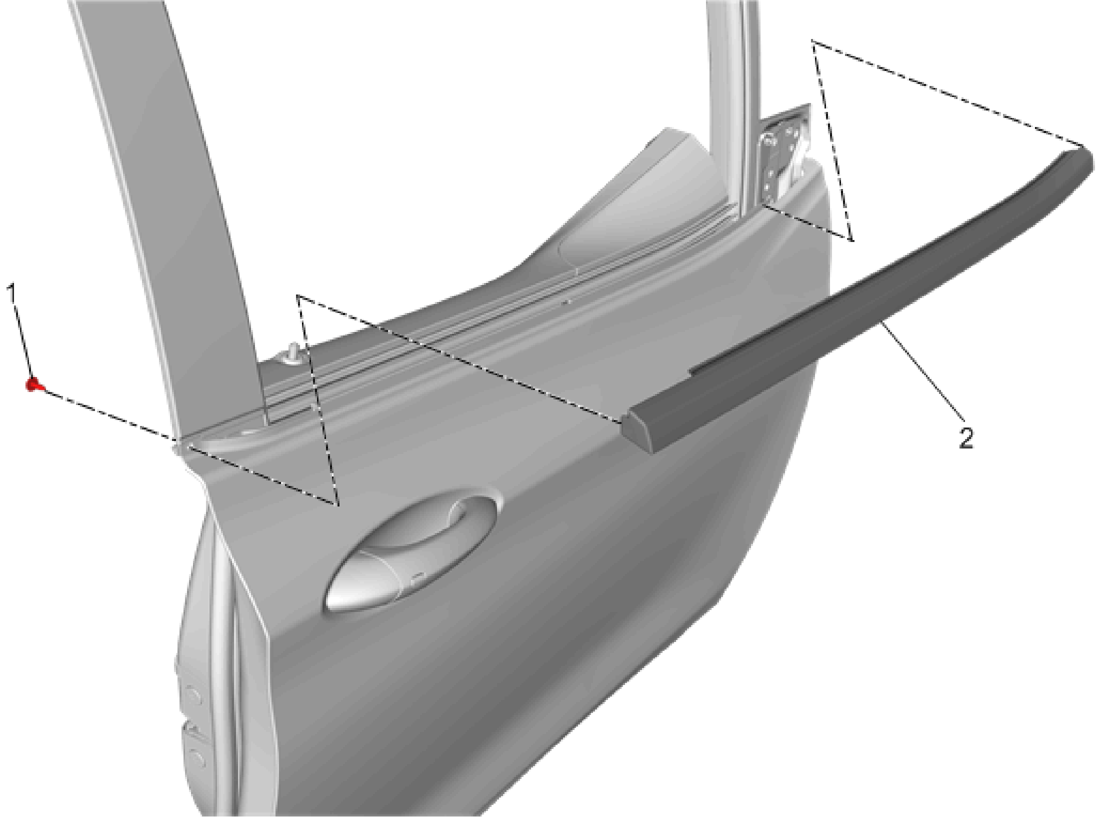

Fig. 55: Front Side Door Window Belt Reveal Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Release the front side door weatherstrip to access the screw. **Front Side Door Weatherstrip Replacement - Door Side** 2. Remove the mirror fasteners, reposition and support the mirror. **Outside Rearview Mirror Replacement**	
1	Front Side Door Window Belt Reveal Molding Screw **CAUTION:** **Refer to Fastener Caution .** **Tighten** 1.5 N.m (13 lb in)
2	Front Side Door Window Belt Reveal Molding

FRONT SIDE DOOR WINDOW UPPER REVEAL MOLDING REPLACEMENT

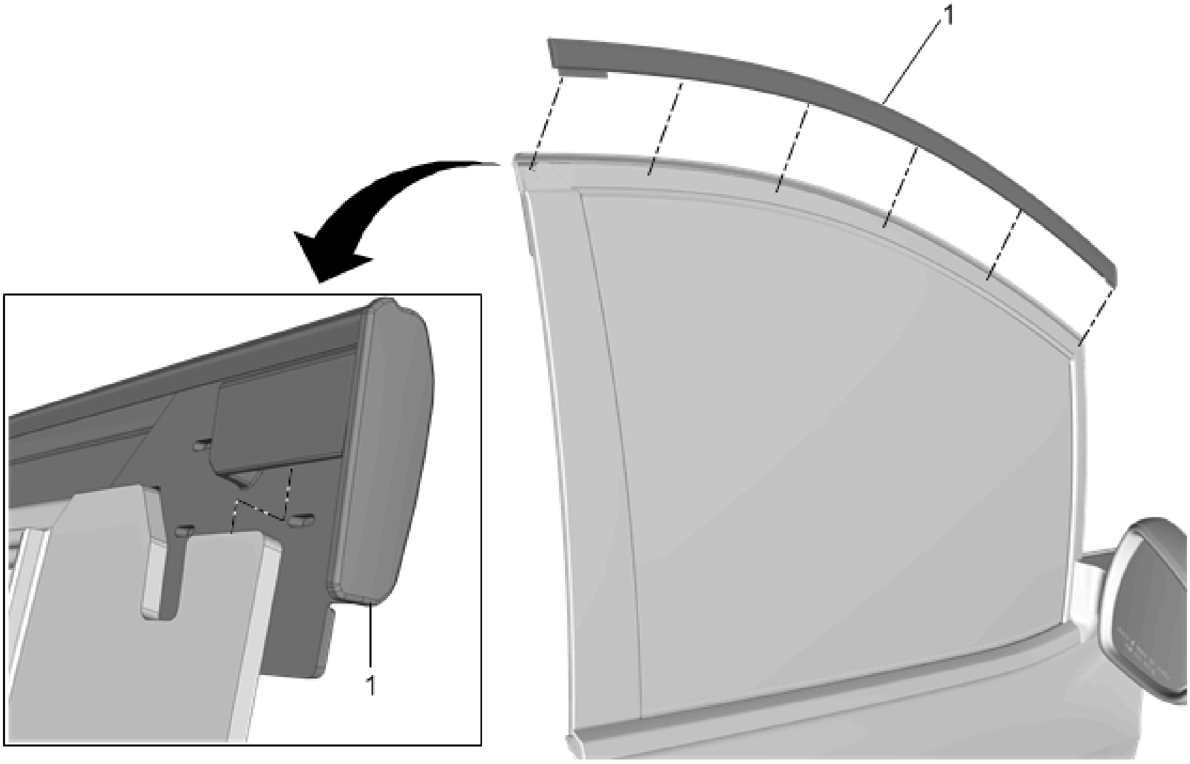

Fig. 56: Front Side Door Window Upper Reveal Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Reposition the upper portion of the door side weatherstrip. Front Side Door Weatherstrip Replacement - Door Side	
1	Front Side Door Window Upper Reveal Molding **Procedure** Using the appropriate tool, release the upper reveal molding.

REAR SIDE DOOR WINDOW INNER SEALING STRIP REPLACEMENT

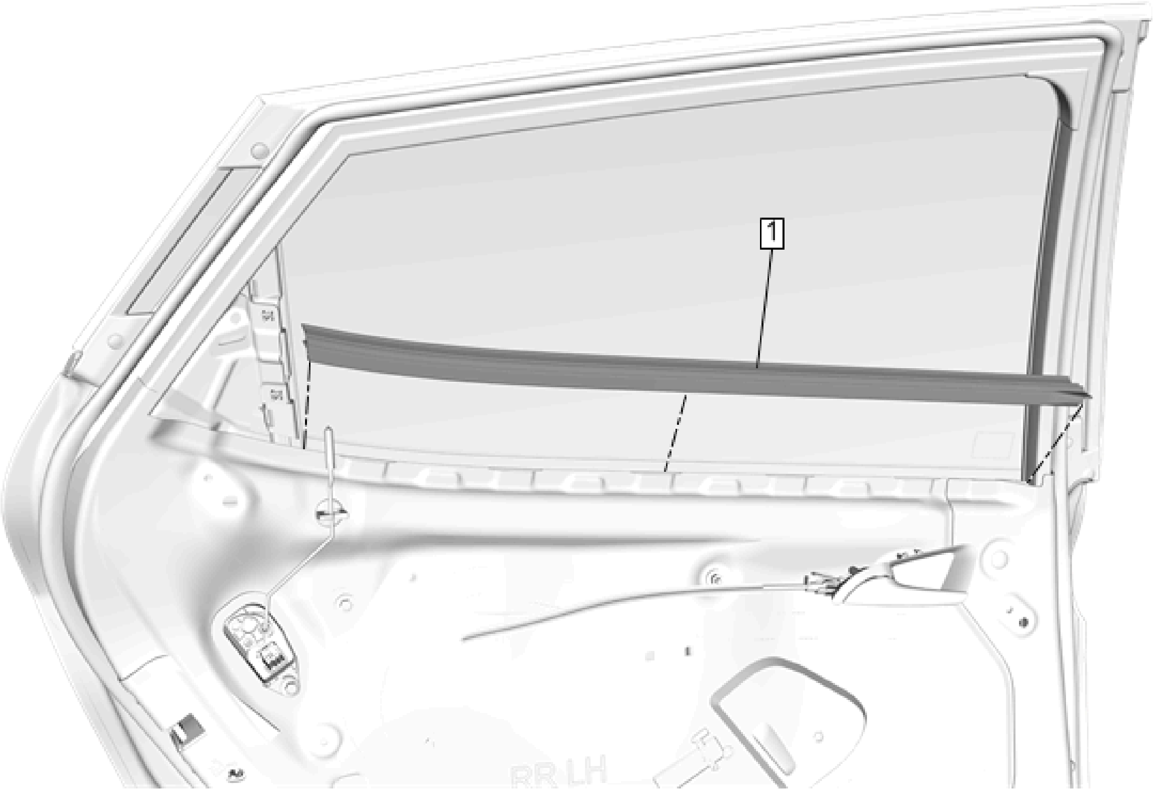

Fig. 57: Rear Side Door Window Inner Sealing Strip
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Side Door Trim Replacement	
1	Rear Side Door Window Inner Sealing Strip **NOTE:** **The sealing strip will come off with the door trim panel. It will need to be removed from the trim panel. The trim panel clips will need to be installed back into the door and then install the sealing strip.**

FRONT SIDE DOOR WINDOW WEATHERSTRIP REPLACEMENT

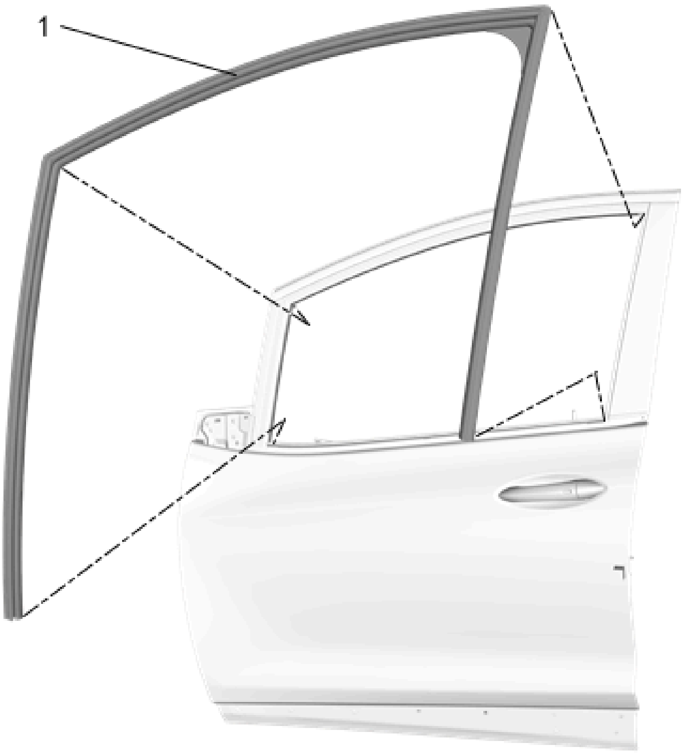

Fig. 58: Front Side Door Window Weatherstrip
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Front Side Door Window Replacement 2. Front Side Door Window Inner Sealing Strip Replacement 3. Radio Front Side Door Speaker Replacement	
1	Front Side Door Window Weatherstrip **Procedure** 1. Grasp both upper corners of the window weatherstrip, pull downward releasing the window weatherstrip from the door frame. 2. Insert the weatherstrip downward in the front and rear channel until fully seated. 3. Inspect the door window for proper operation before installing the door trim panel.

REAR SIDE DOOR WINDOW WEATHERSTRIP REPLACEMENT

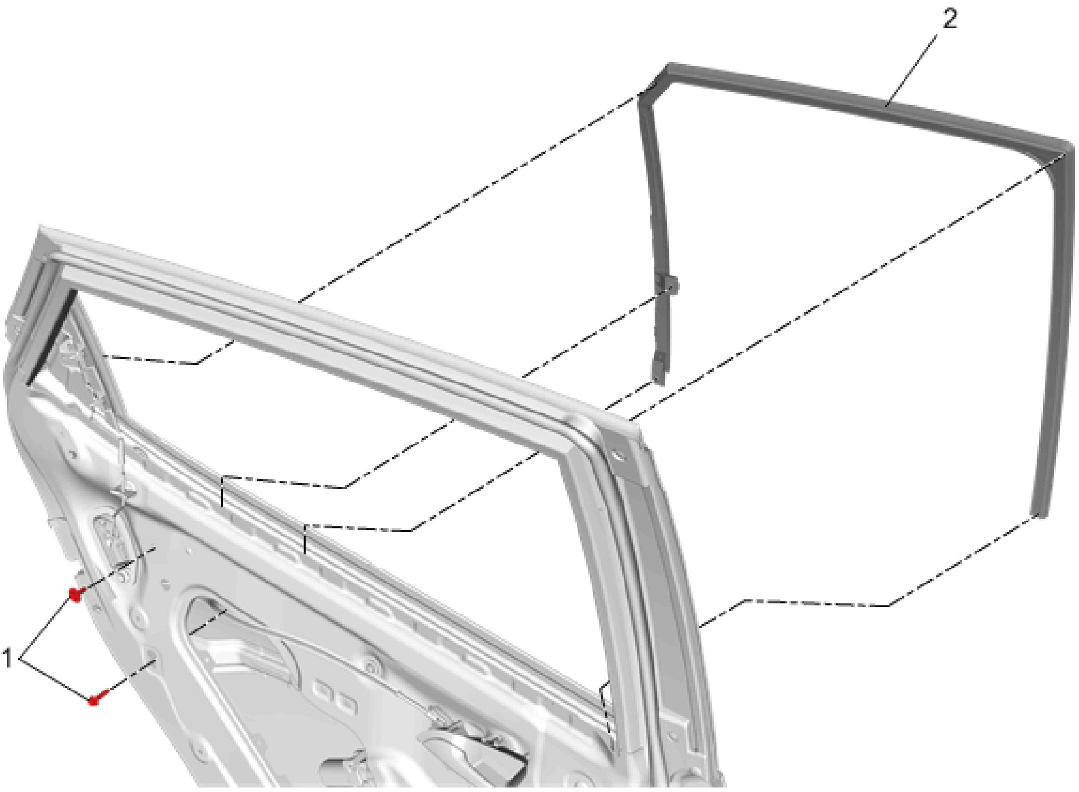

Fig. 59: Rear Side Door Window Weatherstrip
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Rear Side Door Window Replacement 2. Rear Side Door Window Inner Sealing Strip Replacement	
1	Rear Side Door Window Channel Rear Retainer Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)
2	Rear Side Door Window Weatherstrip **Procedure** 1. Grasp both upper corners of the window weatherstrip, pull downward releasing the window weatherstrip from the door frame. 2. Unclip electrical harness from the rear channel. 3. Insert the weatherstrip downward in the front and rear channel until fully seated. 4. Inspect the door window for proper operation before installing the door trim panel.

ADHESIVE INSTALLATION OF STATIONARY WINDOWS

WARNING: **Refer to Glass and Sheet Metal Handling Warning .**

1. Use a urethane adhesive systems which meet GM Specification GM 3651G

2. Remove all mounds or loose pieces of urethane adhesive from the pinchweld area.
3. If the original window is being reused, remove all but approximately 2 mm (3/64 in) of the existing bead of urethane adhesive from the pinchweld flange by using a clean utility knife or razor blade scraper.
4. Inspect for any of the following problems in order to help prevent future breakage of the window:
    - The flange of the window opening
    - High weld
    - Solder spots
    - Hardened sealer
    - Any other obstruction or irregularity in the pinchweld flange

NOTE: **If corrosion of the pinch-weld flange is present or if sheet metal repairs or replacements are required, the pinch-weld flange must be refinished in order to restore the bonding area strength. If paint repairs are required, mask the flange bonding area prior to applying the color coat in order to provide a clean primer only surface. Materials such as BASF DE15Ã,Â®, DuPont 2610Ã,Â®, Sherwin-Williams PSE 4600 and NP70Ã,Â® and Martin-Semour 5120 and 5130Ã,Â® PPG DP90LF SPIES/HECKER 3688/8590 - 3688/5150 - 4070/5090 STANDOX 11158/13320 - 14653/14980 products are approved for this application.**

5. After repairing the opening as indicated, perform the following steps:
6. Use an abrasive pad if necessary to remove mold release buildup from the encapsulated window. Use a dampened lint free cloth to remove any debris remaining on the window.

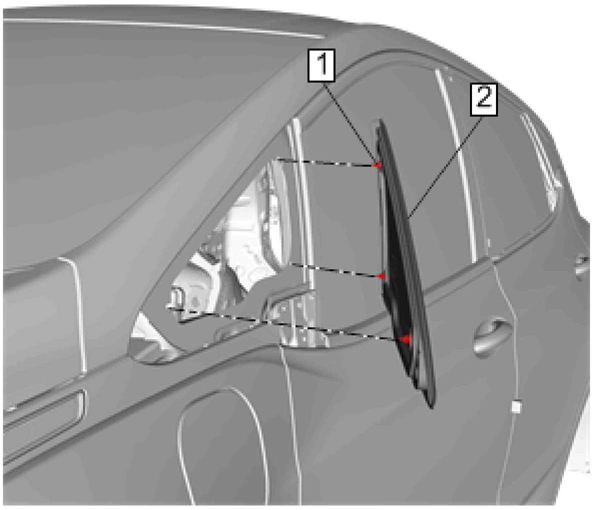

Fig. 60: Stationary Window
Courtesy of GENERAL MOTORS COMPANY

7. Ensure that the window locator pins (1) are positioned to the pinch-weld flange.
8. Dry fit the window (2) to the opening in order to determine the correct position.
9. Use masking tape to mark the locations of the window in the opening.
10. Cut the masking in the center and remove the window from the opening.
11. Verify all primers and urethane adhesive are within expiration dates.

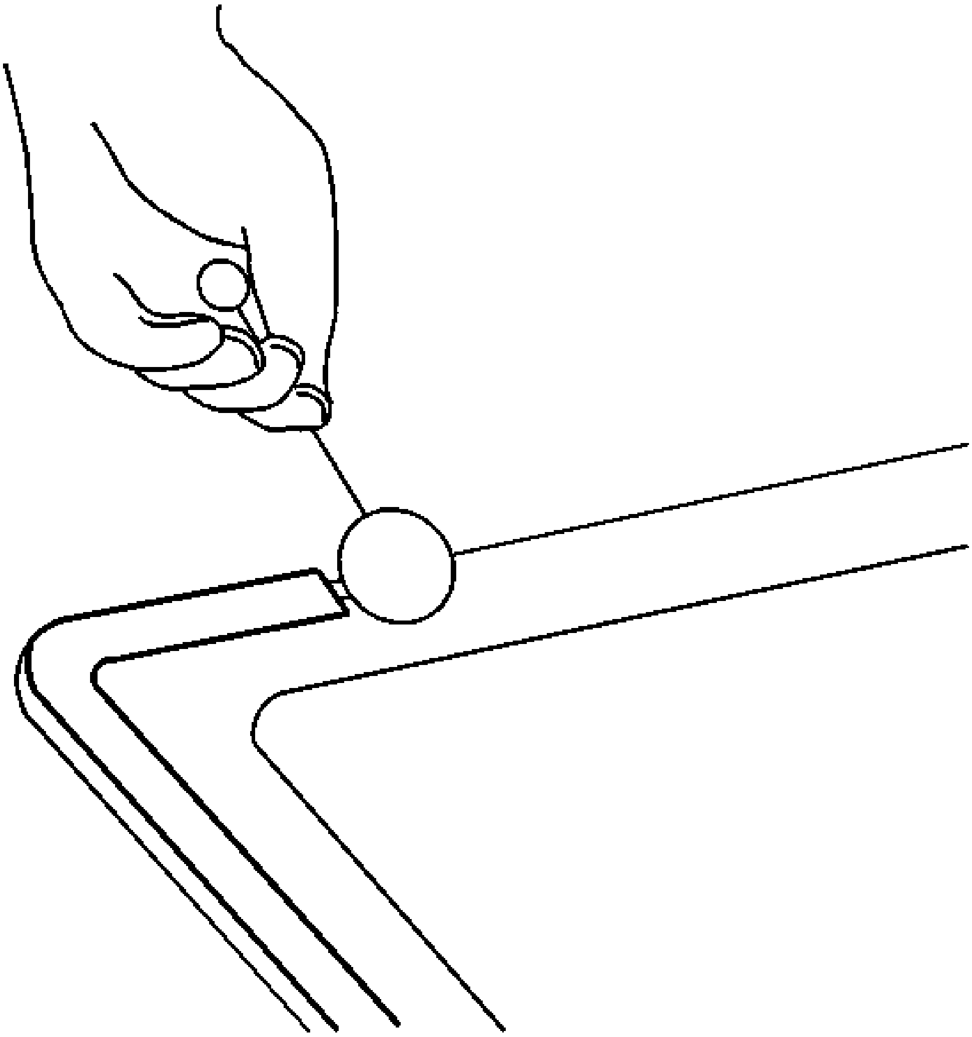

Fig. 61: Applying Glass Prep
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Failure to prep the area prior to the application of primer may cause insufficient bonding of urethane adhesive. Insufficient bonding of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.**

NOTE: **Do not apply the black primer to the existing bead of the urethane adhesive on the pinch-weld flange. Apply the primer only to nicks, scratches or the primed surfaces.**

12. Shake the primer clear for at least 1 minute.
13. Use a new dauber in order to apply the primer to the surface of the encapsulated window.
14. Allow the primer to dry for approximately 6 minutes.

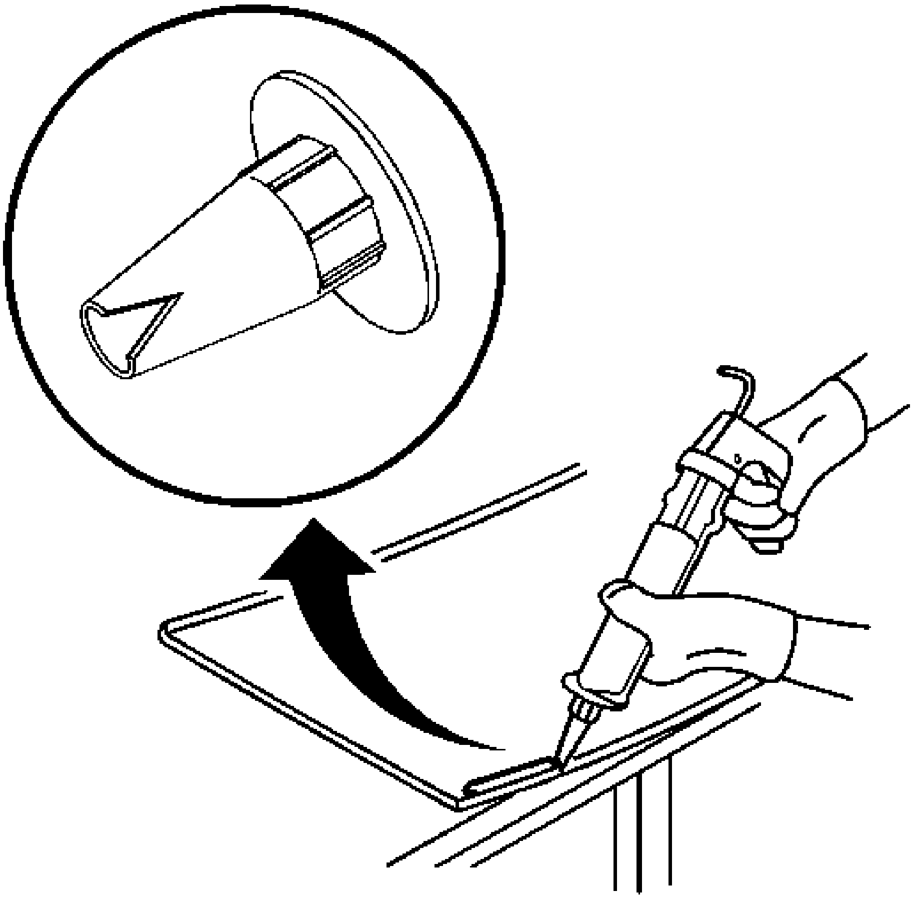

Fig. 62: Modified Applicator Nozzle
Courtesy of GENERAL MOTORS COMPANY

15. Cut the applicator nozzle in order to provide a bead of 8 mm (0. 31 in) wide, 12 mm (0. 50 in) high.

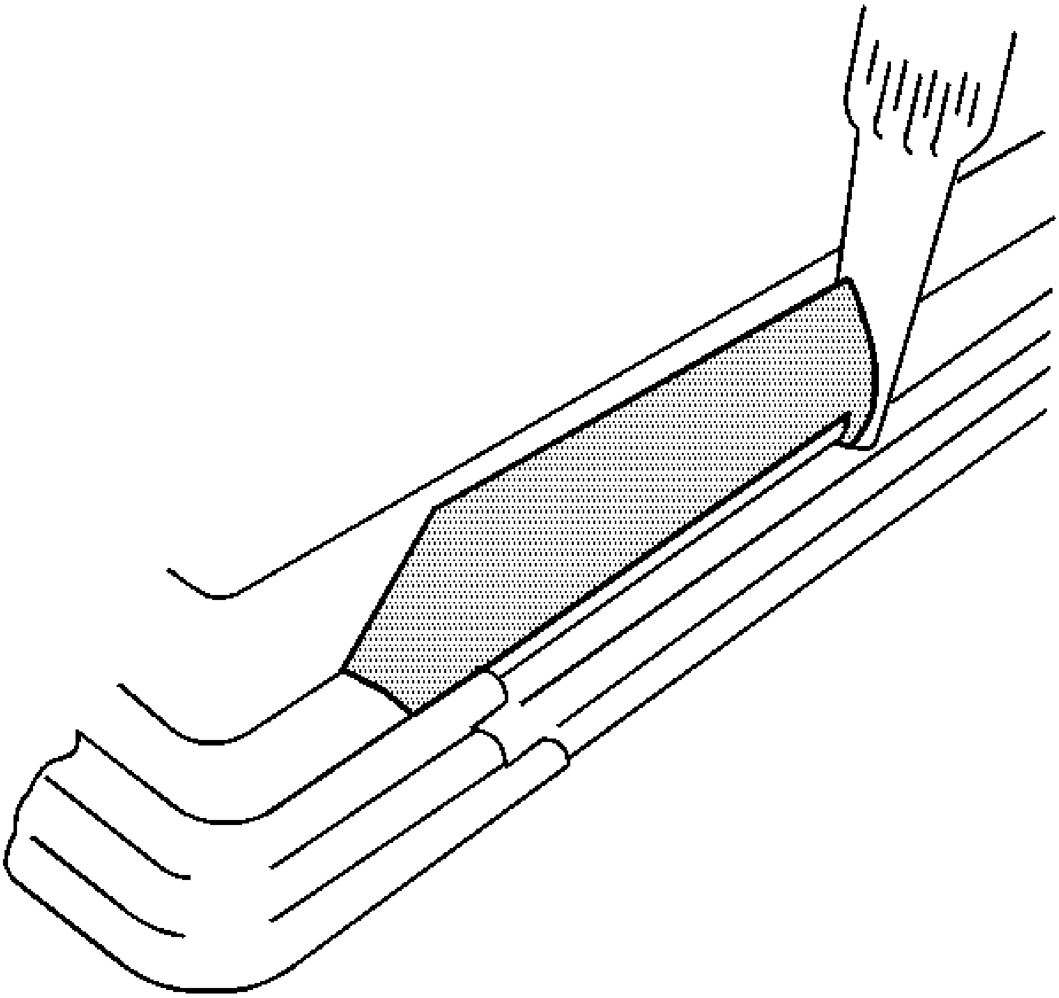

Fig. 63: Applying Continuous Bead Of Urethane Adhesive
Courtesy of GENERAL MOTORS COMPANY

16. Use a cartridge-type caulking gun in order to apply a smooth, continuous bead of urethane adhesive.
17. Use the edge of the inside encapsulated window track as a guide for the nozzle in order to apply the urethane adhesive.
18. Place the window in the opening.
19. Align the masking tape lines on the window and the body.
20. Press firmly around the entire periphery of the window in order to wet-out the urethane bead.
21. Tape the window to the body in order to minimize movement until the urethane adhesive cures.
22. Clean any excess urethane adhesive from the body.

NOTE: **Do not direct a hard stream of high pressure water to the freshly applied urethane adhesive.**

23. Use a soft spray of warm water in order to immediately water test the window.
24. Inspect the window for leaks.
25. If any leaks are found, use a plastic paddle in order to apply extra urethane adhesive at the leak point.
26. Retest the window for leaks.

WARNING: **Insufficient curing of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.**

- **For the moisture-curing type of urethane adhesive, allow a minimum of 6 hours at 21Ã‚Â°C (70Ã‚Â°F) or greater and with at least 30 percent relative humidity. Allow at least 24 hours for the complete curing of the urethane adhesive.**

- **For the chemical-curing type of urethane adhesive, allow a minimum of 1 hour.**

Do NOT physically disturb the repair area until after these minimum times have elapsed.

27. Maintain the following conditions in order to properly cure the urethane adhesive:
    - Partially lower a door window in order to prevent pressure buildups when closing doors before the urethane adhesive cures.
    - Do not drive the vehicle until the urethane adhesive is cured. Refer to the above curing times.
    - Do not use compressed air in order to dry the urethane adhesive.
28. Complete the window installation.

ADHESIVE INSTALLATION OF WINDSHIELDS

WARNING: **Refer to Glass and Sheet Metal Handling Warning .**

1. Use a urethane adhesive systems which meet GM Specification GM 3651G.
2. Remove all mounds or loose pieces of urethane adhesive from the pinchweld area.
3. If the original window is being reused, remove all but approximately 2 mm (3/64 in) of the existing bead of urethane adhesive from the pinchweld flange by using a clean utility knife or razor blade scraper.
4. Inspect for any of the following problems in order to help prevent future breakage of the window:
    - The flange of the window opening
    - High weld
    - Solder spots
    - Hardened sealer
    - Any other obstruction or irregularity in the pinchweld flange

NOTE: **If corrosion of the pinch-weld flange is present or if sheet metal repairs or replacements are required, the pinch-weld flange must be refinished in order to restore the bonding area strength. If paint repairs are required, mask the flange bonding area prior to applying the color coat in order to provide a clean primer only surface. Materials such as BASF DE15Ã‚Â®, DuPont 2610Ã‚Â®, Sherwin-Williams PSE 4600 and NP70Ã‚Â® and Martin-Semour 5120 and 5130Ã‚Â® PPG DP90LF SPIES/ HECKER 3688/8590 - 3688/5150 - 4070/5090 STANDOX 11158/13320 - 14653/14980 products are approved for this application.**

5. After repairing the opening as indicated, perform the following steps:
    1. Remove all traces of broken glass from the outer cowl panel, seats, floor and defroster ducts.
    2. Clean around the edge of the inside surface of the window with a 50/50 mixture of isopropyl alcohol and water by volume on a dampened lint free cloth.
6. Verify all primers and urethane adhesive are within expiration dates.

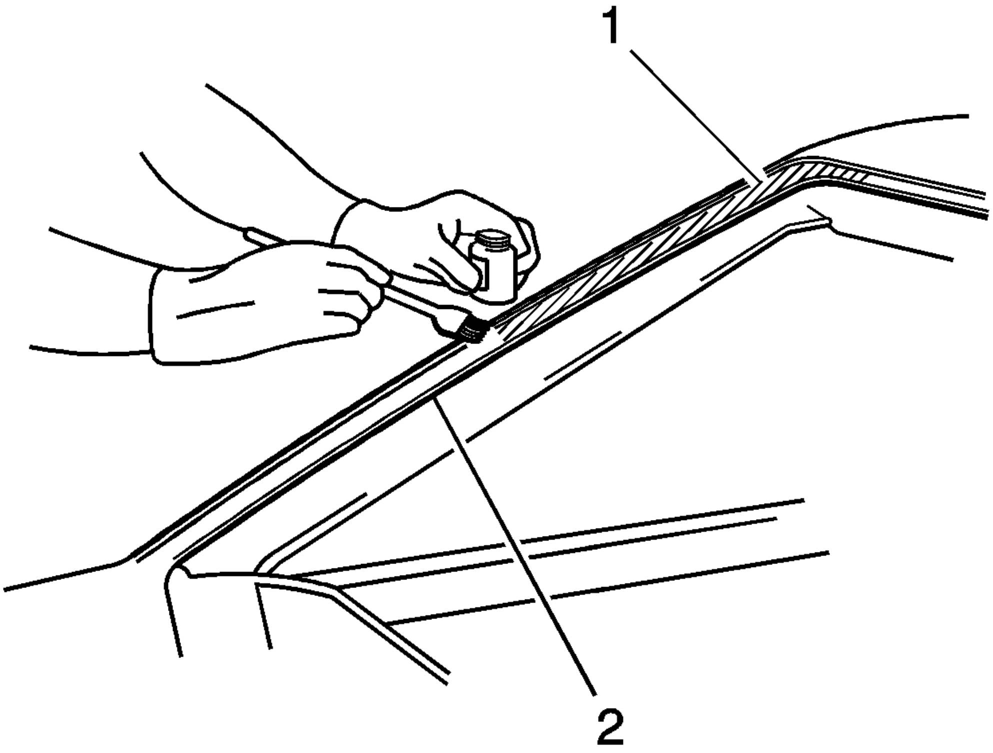

Fig. 64: Applying Pinch-Weld Primer
Courtesy of GENERAL MOTORS COMPANY

WARNING: **Failure to prep the area prior to the application of primer may cause insufficient bonding of urethane adhesive. Insufficient bonding of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.**

NOTE: **Do not apply the black primer to the existing bead of the urethane adhesive on the pinch-weld flange. Apply the primer only to nicks, scratches or the primed surfaces.**

7. Shake the pinch-weld primer for at least 1 minute.
8. Use a new dauber in order to apply the primer to the surface of the pinch-weld flange (1).
9. Allow the pinch-weld primer to dry for approximately 10 minutes.

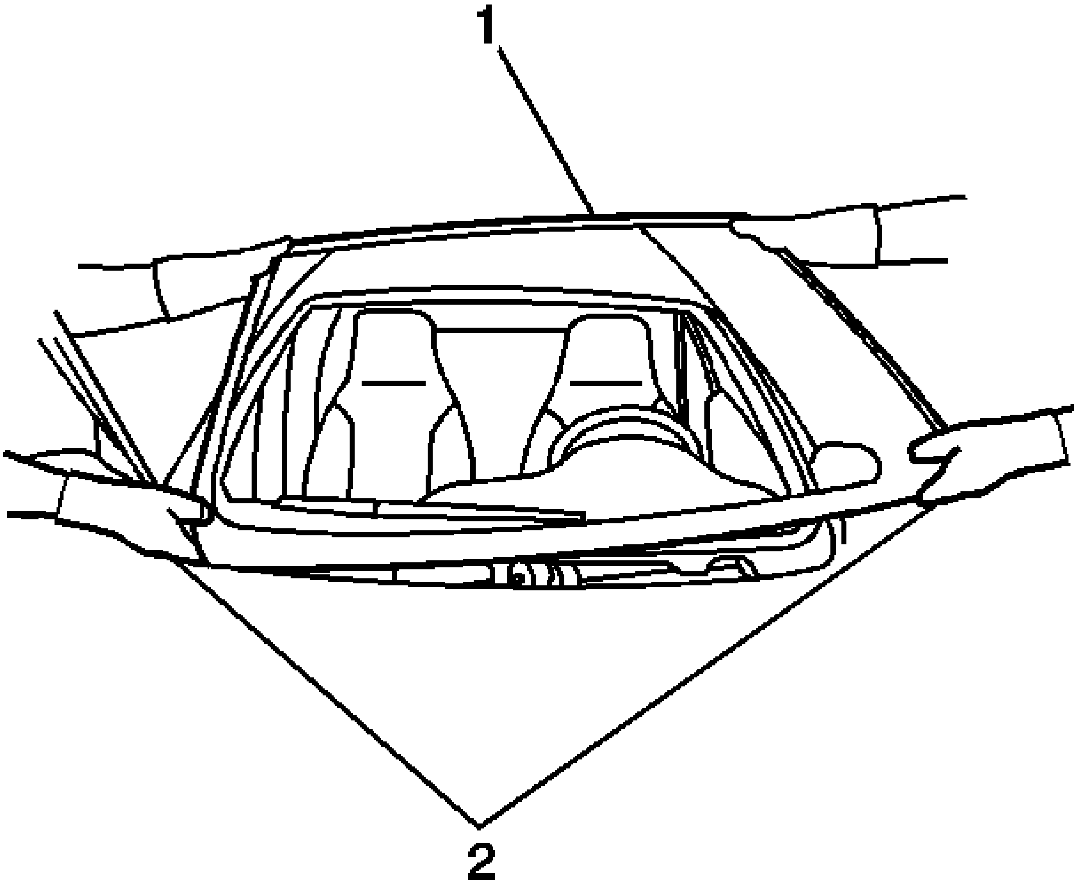

Fig. 65: Removing/Installing Windshield
Courtesy of GENERAL MOTORS COMPANY

10. With the an assistant, dry fit the window (1) to the opening in order to determine the correct position.

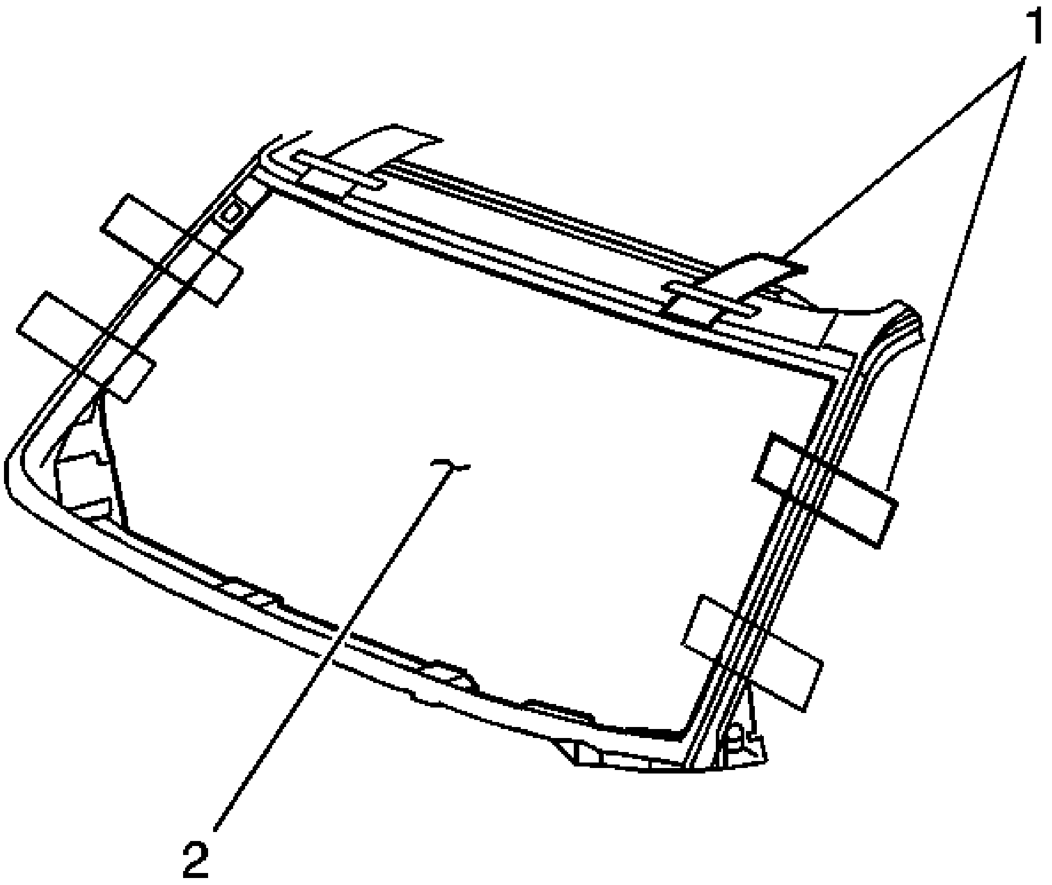

Fig. 66: Aligning Tape Lines On Window To Body
Courtesy of GENERAL MOTORS COMPANY

11. Use masking tape in order to mark the locations (1) of the window (2) in the opening.
12. Cut the masking tape in the center and remove the window from the opening.

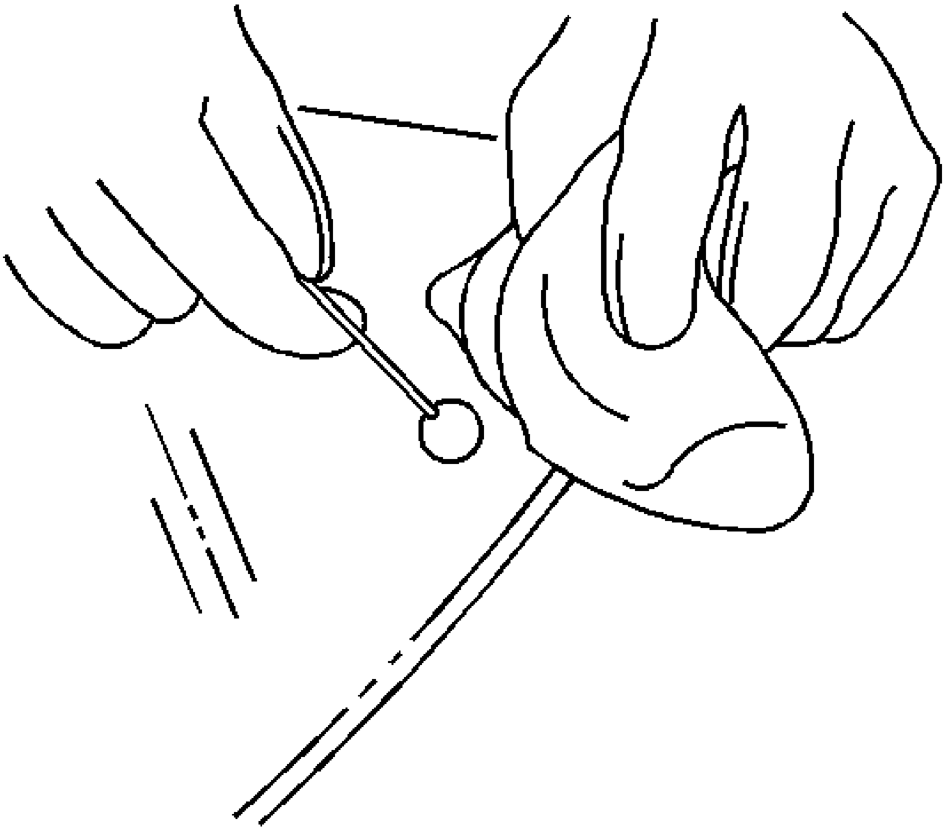

Fig. 67: Applying Glass Prep
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Use care when applying glass prep clear on the window. This primer dries almost instantly, and may stain the viewing area of the window if not applied evenly.**

13. Use a new dauber in order to apply glass prep clear to the area approximately 10 - 16 mm (3/8 - 5/8 in) around the entire perimeter of the window inner surface.

    Immediately wipe the glass primed area using a clean, lint-free cloth.

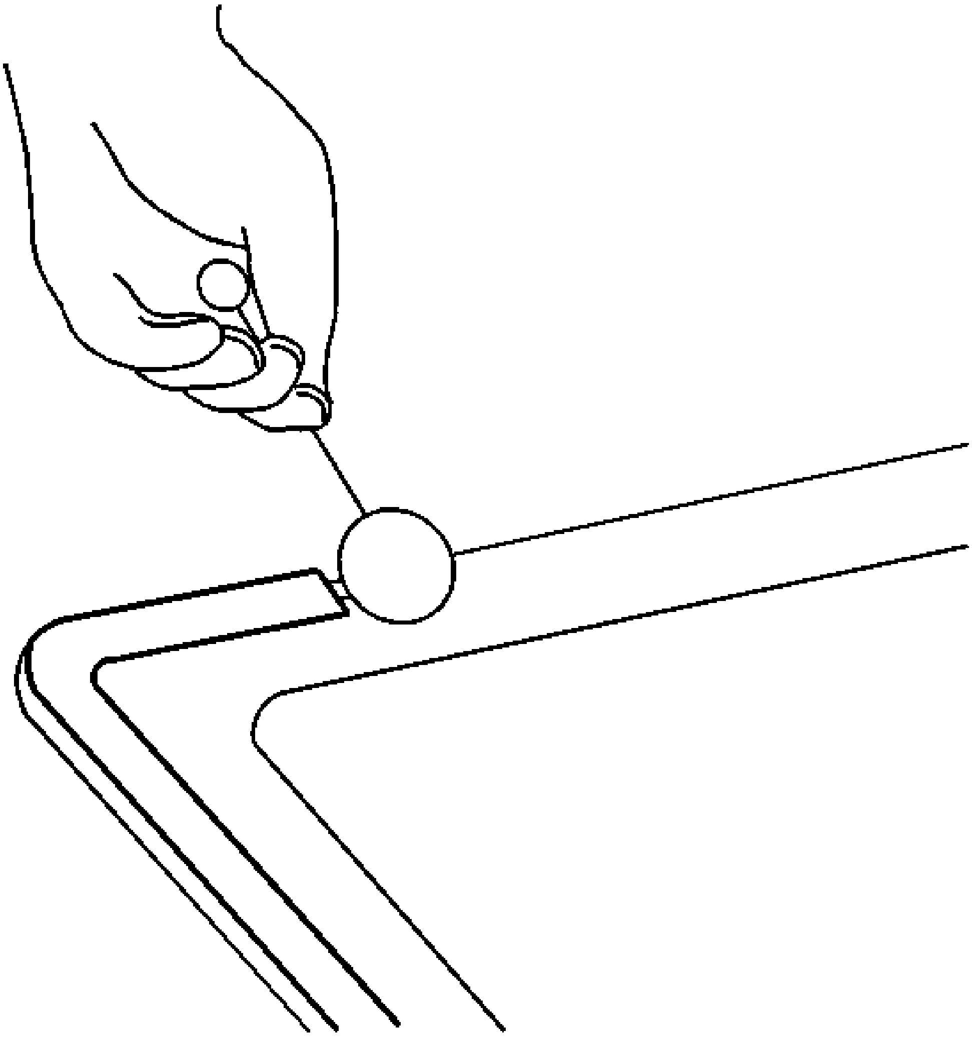

Fig. 68: Applying Glass Prep
Courtesy of GENERAL MOTORS COMPANY

14. Apply a second coat of the glass prep clear to the same area of the glass.

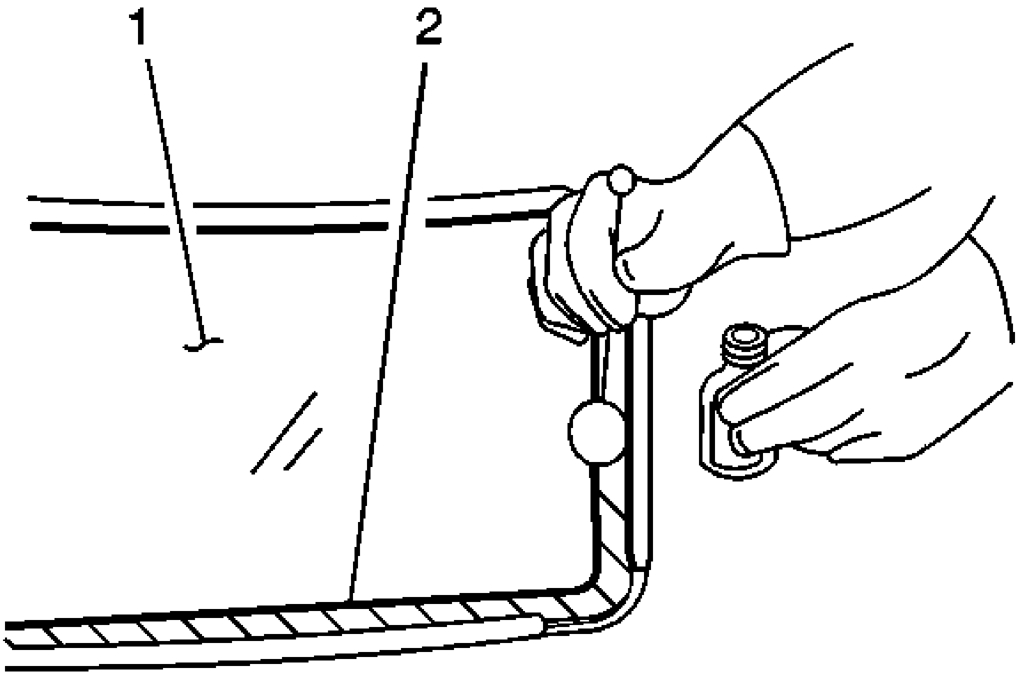

Fig. 69: Applying Glass Primer
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The glass primer black is effective up to 8 hours after applying it to the glass. The primed surface of the glass must be kept clean.**

15. Shake the glass primer black for at least 1 minute.
16. Use a new dauber in order to apply the glass primer black to the same areas (2) that glass prep clear was applied.
17. Allow the glass primer to dry for approximately 10 minutes.

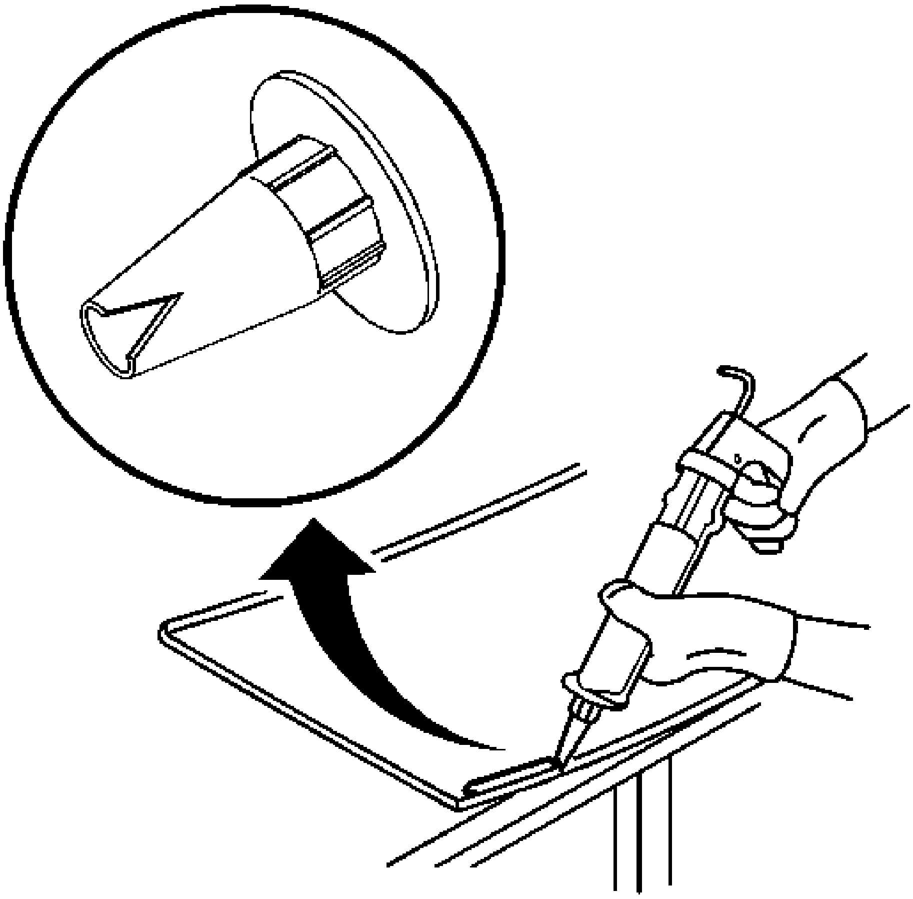

Fig. 70: Modified Applicator Nozzle
Courtesy of GENERAL MOTORS COMPANY

18. Cut the applicator nozzle in order to provide a bead of 12. 7 mm (1/2 in) wide and 12. 7 mm (1/2 in) high.

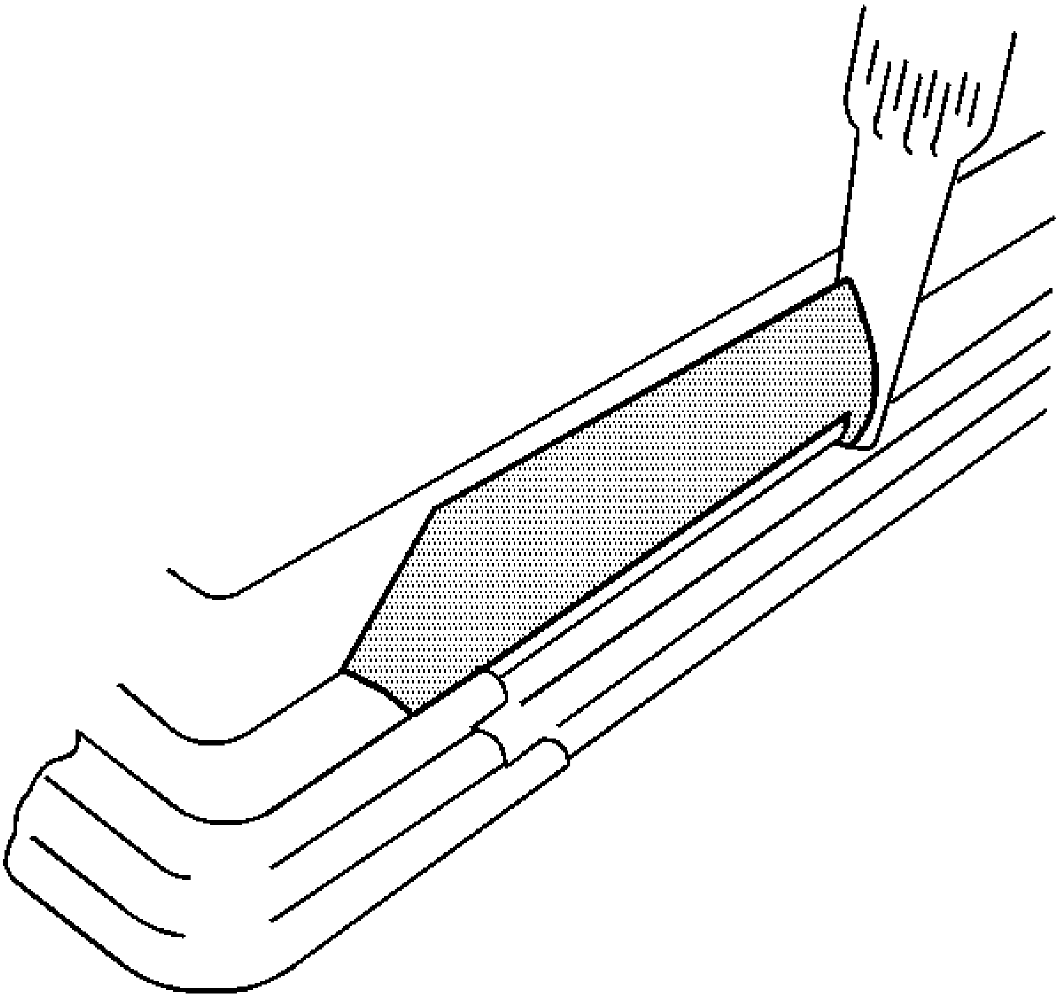

Fig. 71: Applying Continuous Bead Of Urethane Adhesive
Courtesy of GENERAL MOTORS COMPANY

19. Use a cartridge-type caulking gun in order to apply a smooth, continuous bead of urethane adhesive.

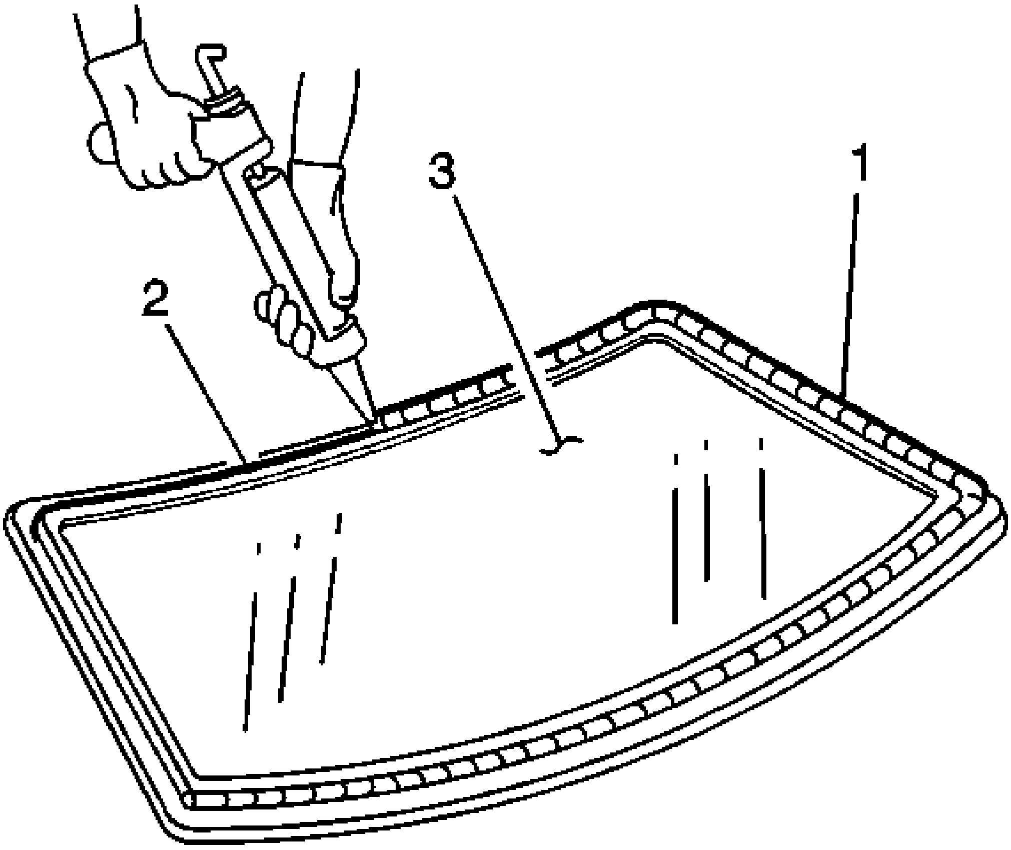

Fig. 72: Applying Urethane Adhesive To Inner Surface Of Window
Courtesy of GENERAL MOTORS COMPANY

20. Use the edge of the window as a guide for the nozzle in order to apply the urethane adhesive (1) to the inner surface of the window (3).

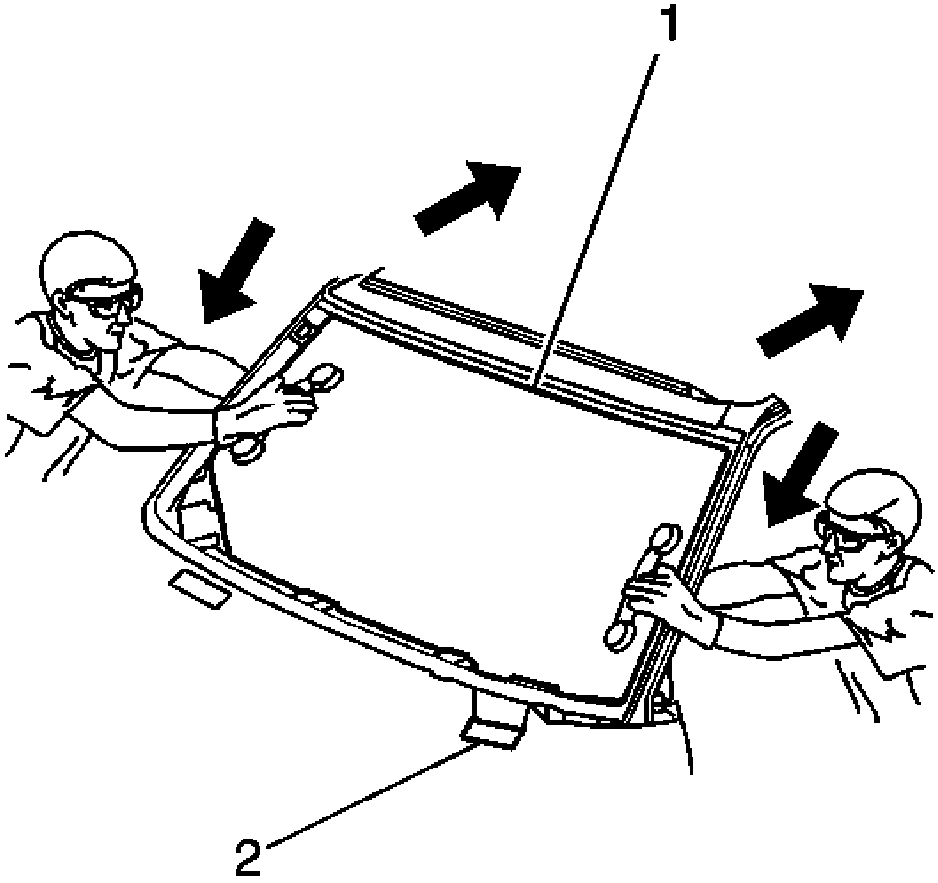

Fig. 73: Installing Windshield
Courtesy of GENERAL MOTORS COMPANY

21. With an assistant, installing the windshield (1) to the locator pins to the slots located in each corner of the upper pinch-weld flange.

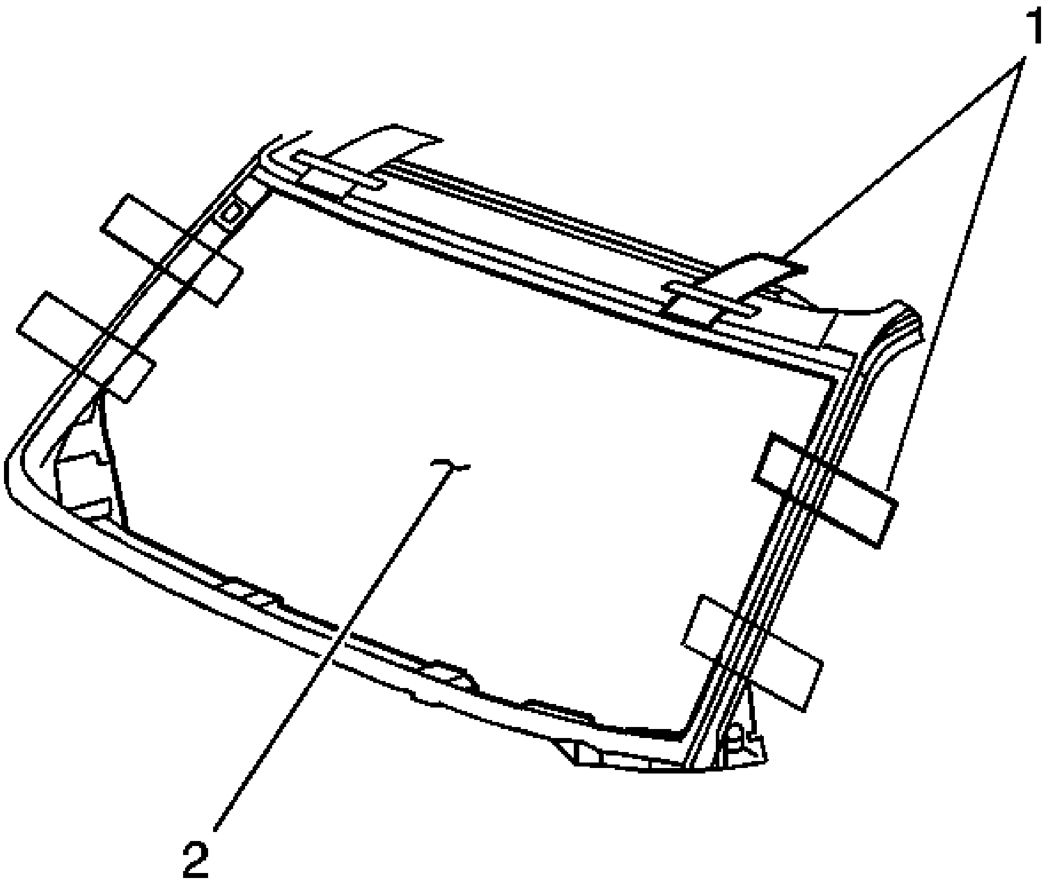

Fig. 74: Aligning Tape Lines On Window To Body
Courtesy of GENERAL MOTORS COMPANY

22. Align the masking tape (1) lines on the window (2) and the body.

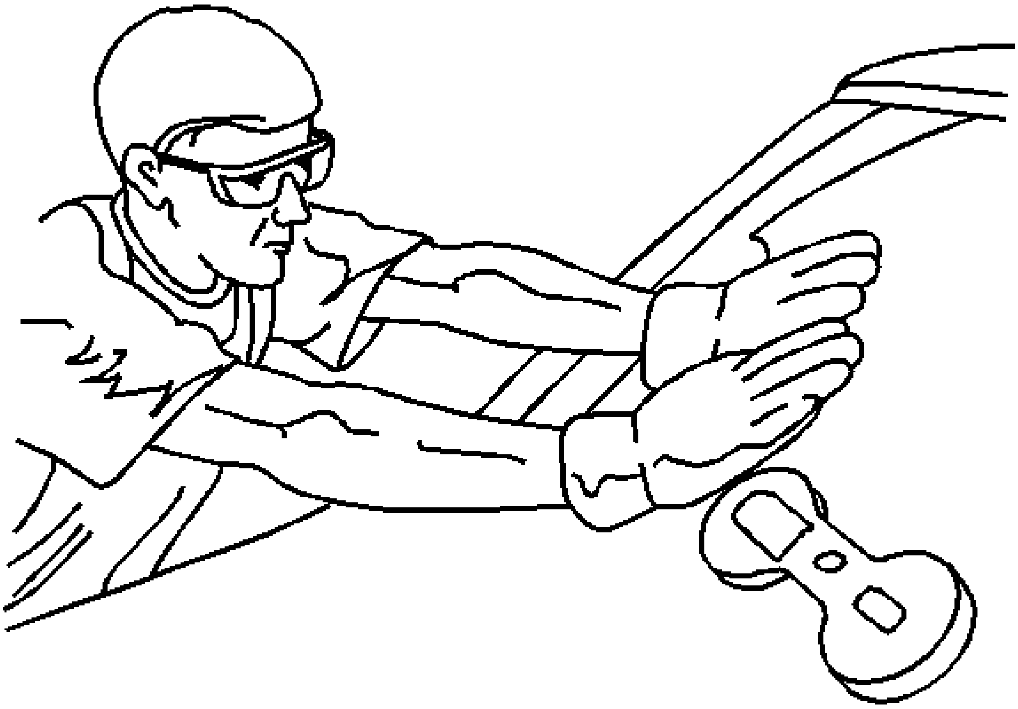

Fig. 75: Pressing Window Into Place
Courtesy of GENERAL MOTORS COMPANY

23. Press the window firmly into place, 1 mm (0. 039 in) below surface.
24. Tape the window to the body in order to minimize movement until the urethane adhesive cures.

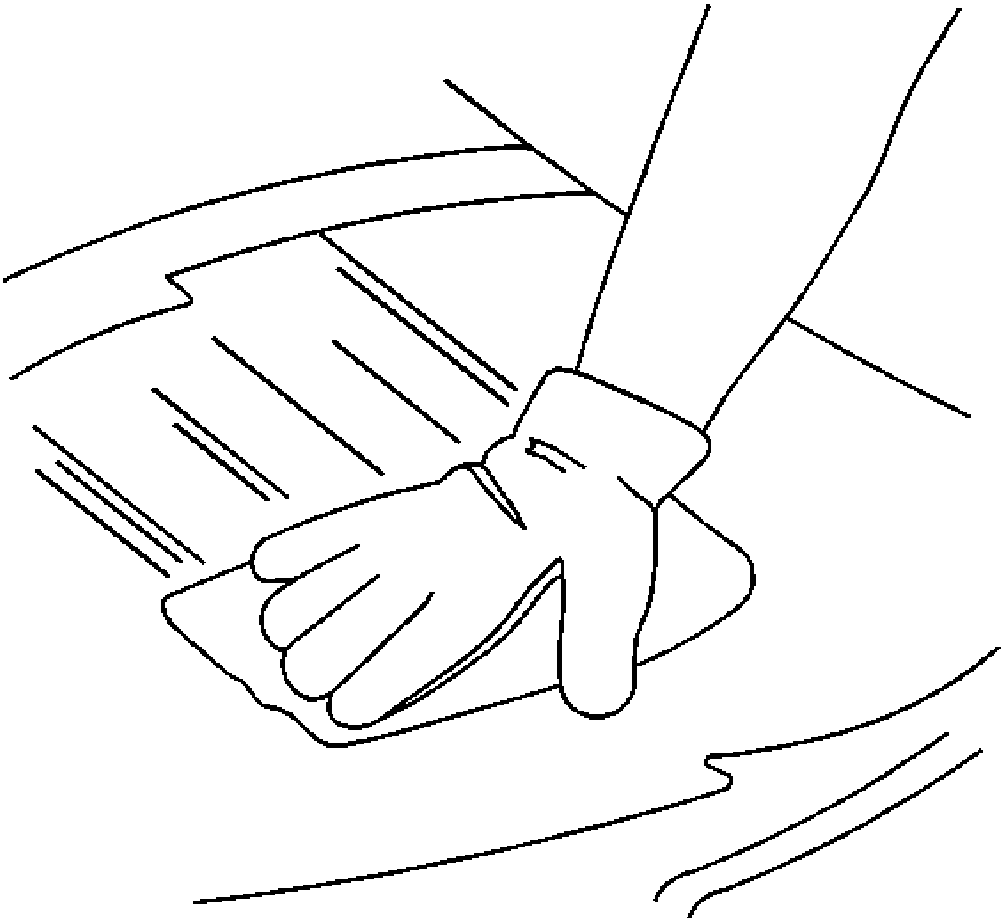

Fig. 76: Cleaning Excess Urethane Adhesive From Body
Courtesy of GENERAL MOTORS COMPANY

25. Clean any excess urethane adhesive from the body.

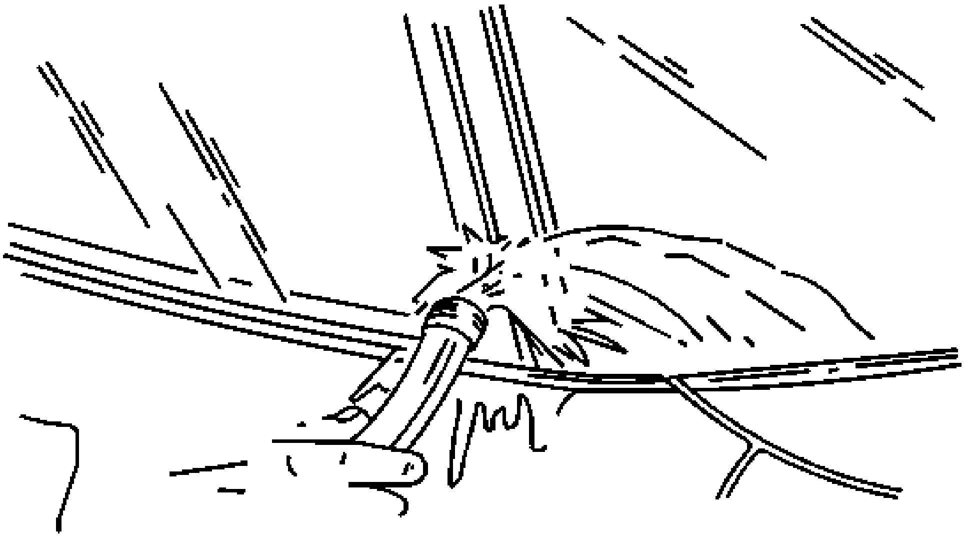

Fig. 77: Performing Water Hose Test
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not direct a hard stream of high pressure water to the freshly applied urethane adhesive.**

26. Use a soft spray of warm water in order to immediately water test the window.
27. Inspect the window for leaks.
28. If any leaks are found, use a plastic paddle in order to apply extra urethane adhesive at the leak point.
29. Retest the window for leaks.

WARNING: **Insufficient curing of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.**

- **For the moisture-curing type of urethane adhesive, allow a minimum of 6 hours at 21Ã‚Â°C (70Ã‚Â°F) or greater and with at least 30 percent relative humidity. Allow at least 24 hours for the complete curing of the urethane adhesive.**
- **For the chemical-curing type of urethane adhesive, allow a minimum of 1 hour.**

Do NOT physically disturb the repair area until after these minimum times have elapsed.

30. Maintain the following conditions in order to properly cure the urethane adhesive:
    - Partially lower a door window in order to prevent pressure buildups when closing doors before the urethane adhesive cures.
    - Do not drive the vehicle until the urethane adhesive is cured. Refer to the above curing times.

- Do not use compressed air in order to dry the urethane adhesive.

31. Complete the window installation.

ADHESIVE INSTALLATION OF REAR WINDOWS

WARNING: **Refer to Glass and Sheet Metal Handling Warning .**

1. Use a urethane adhesive systems which meet GM Specification GM 3651G.
2. Remove all mounds or loose pieces of urethane adhesive from the pinchweld area.
3. If the original window is being reused, remove all but approximately 2 mm (3/64 in) of the existing bead of urethane adhesive from the pinchweld flange by using a clean utility knife or razor blade scraper.
4. Inspect for any of the following problems in order to help prevent future breakage of the window:
    - The flange of the window opening
    - High weld
    - Solder spots
    - Hardened sealer
    - Any other obstruction or irregularity in the pinchweld flange

NOTE: **If corrosion of the pinch-weld flange is present or if sheet metal repairs or replacements are required, the pinch-weld flange must be refinished in order to restore the bonding area strength. If paint repairs are required, mask the flange bonding area prior to applying the color coat in order to provide a clean primer only surface. Materials such as BASF DE15Ã‚Â®, DuPont 2610Ã‚Â®, Sherwin-Williams PSE 4600 and NP70Ã‚Â® and Martin-Semour 5120 and 5130Ã‚Â® PPG DP90LF SPIES/HECKER 3688/8590 - 3688/5150 - 4070/5090 STANDOX 11158/13320 - 14653/14980 products are approved for this application.**

5. After repairing the opening as indicated, perform the following steps:
    1. Remove all traces of broken glass from the outer cowl panel, seats, floor and defroster ducts.
    2. Clean around the edge of the inside surface of the window with a 50/50 mixture of isopropyl alcohol and water by volume on a dampened lint free cloth.
6. Verify all primers and urethane adhesive are within expiration dates.

WARNING: **Failure to prep the area prior to the application of primer may cause insufficient bonding of urethane adhesive. Insufficient bonding of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.**

NOTE: **Do not apply the black #3 primer to the existing bead (1) of the urethane adhesive on the pinch-weld flange. Apply the primer only to nicks, scratches or the primed surfaces.**

7. Shake the pinch-weld primer black #3 for at least 1 minute.
8. Use a new dauber in order to apply the primer to the surface of the pinch-weld flange (1).
9. Allow the pinch-weld primer to dry for approximately 10 minutes.

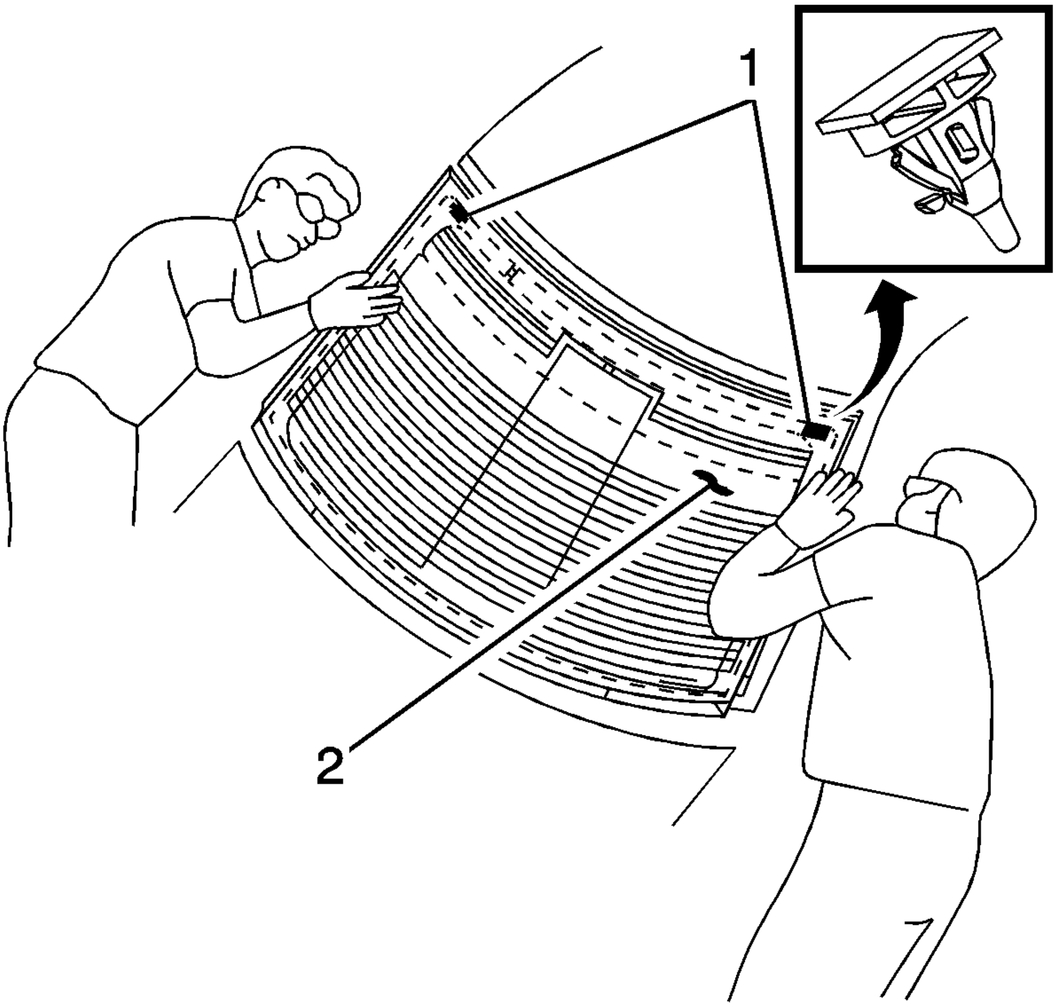

Fig. 78: Installing Rear Window
Courtesy of GENERAL MOTORS COMPANY

10. With the aid of an assistant, dry fit the window (1) to the opening in order to determine the correct position.
11. Ensure the window locator pins are positioned into the locator slots in the pinch-weld flange.
12. Use masking tape to mark the locations of the window in the opening.
13. Cut the masking in the center and remove the window from the opening.

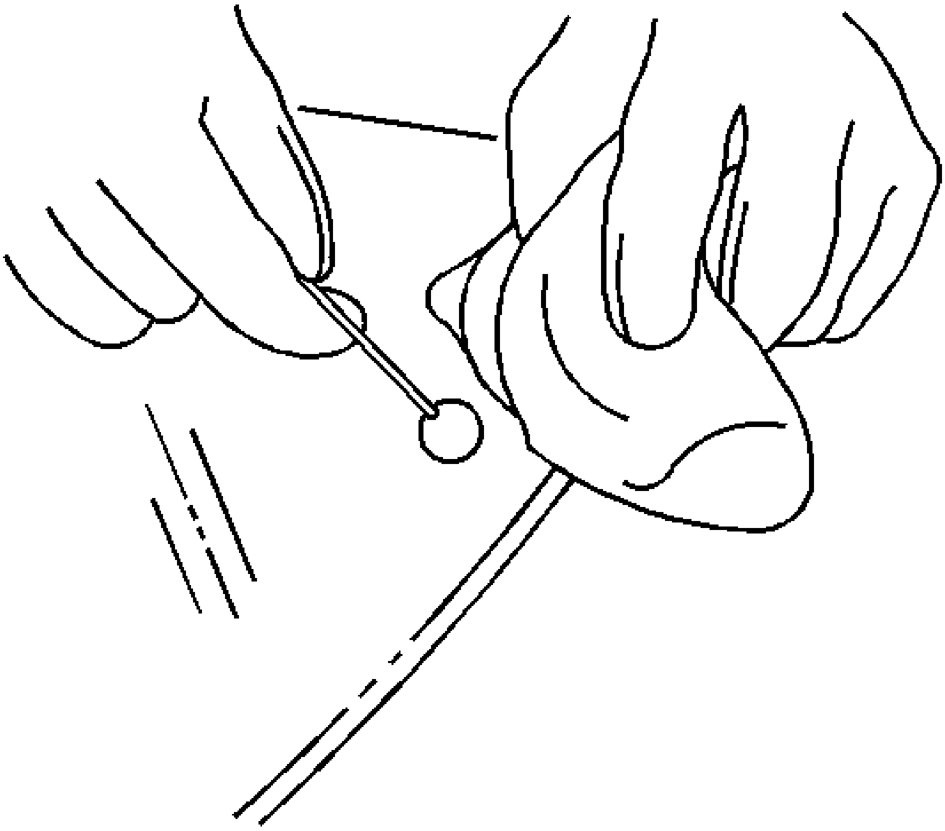

Fig. 79: Applying Glass Prep
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Use care when applying glass prep clear on the window. This primer dries almost instantly, and may stain the viewing area of the window if not applied evenly.**

14. Use a new dauber in order to apply glass prep clear to the area approximately 18 mm (0. 71 in) around the entire perimeter of the window inner surface.

    Immediately wipe the glass primed area using a clean, lint-free cloth.

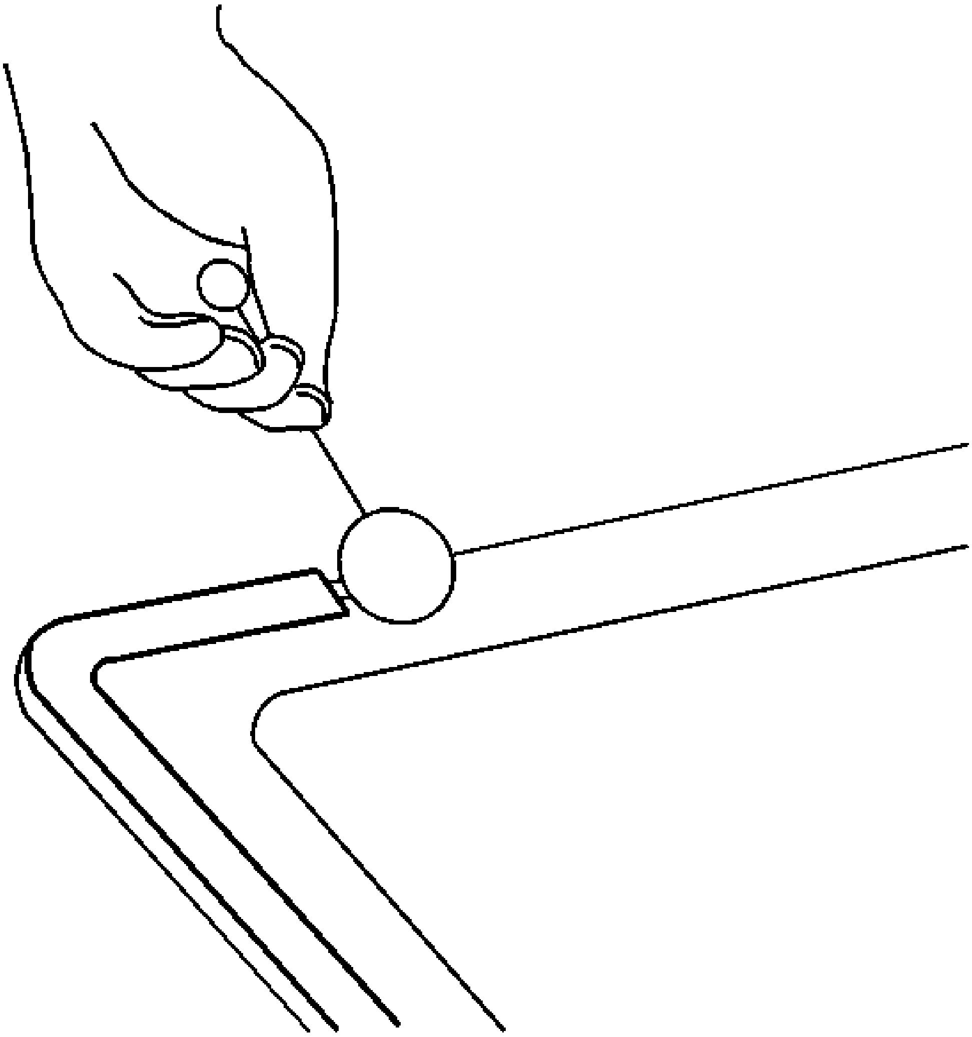

Fig. 80: Applying Glass Prep
Courtesy of GENERAL MOTORS COMPANY

15. Apply a second coat of the glass prep clear to the same area of the glass.

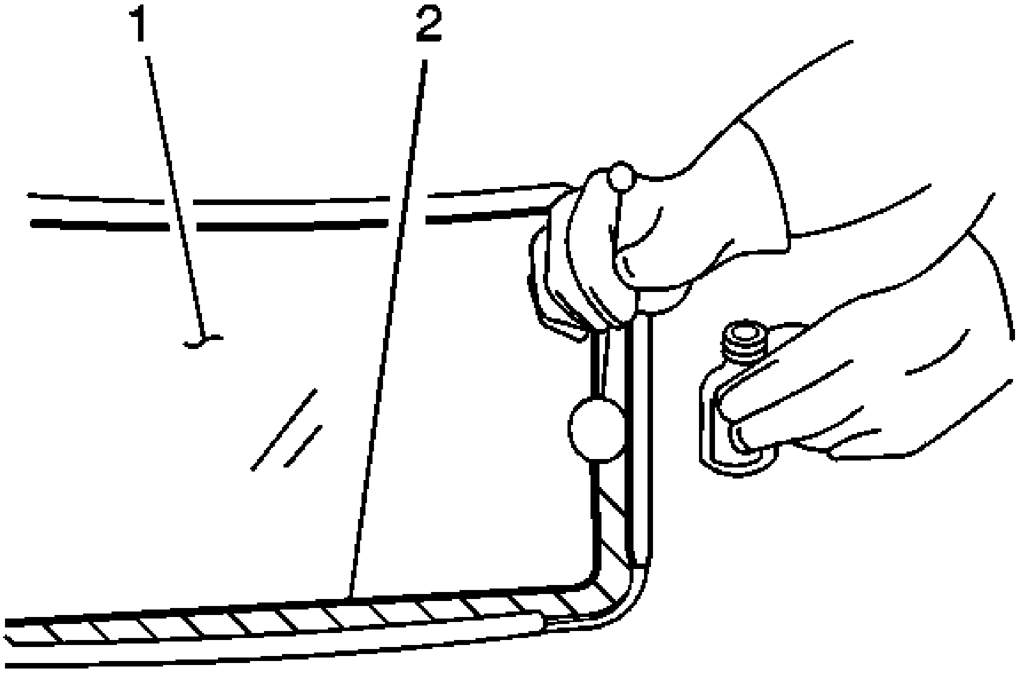

Fig. 81: Applying Glass Primer
Courtesy of GENERAL MOTORS COMPANY

NOTE: **The glass primer black is effective up to 8 hours after applying it to the glass. The primed surface of the glass must be kept clean.**

16. Shake the glass primer black for at least 1 minute.
17. Use a new dauber in order to apply the glass primer black to the same areas (2) that glass prep clear was applied.
18. Allow the glass primer to dry for approximately 10 minutes.

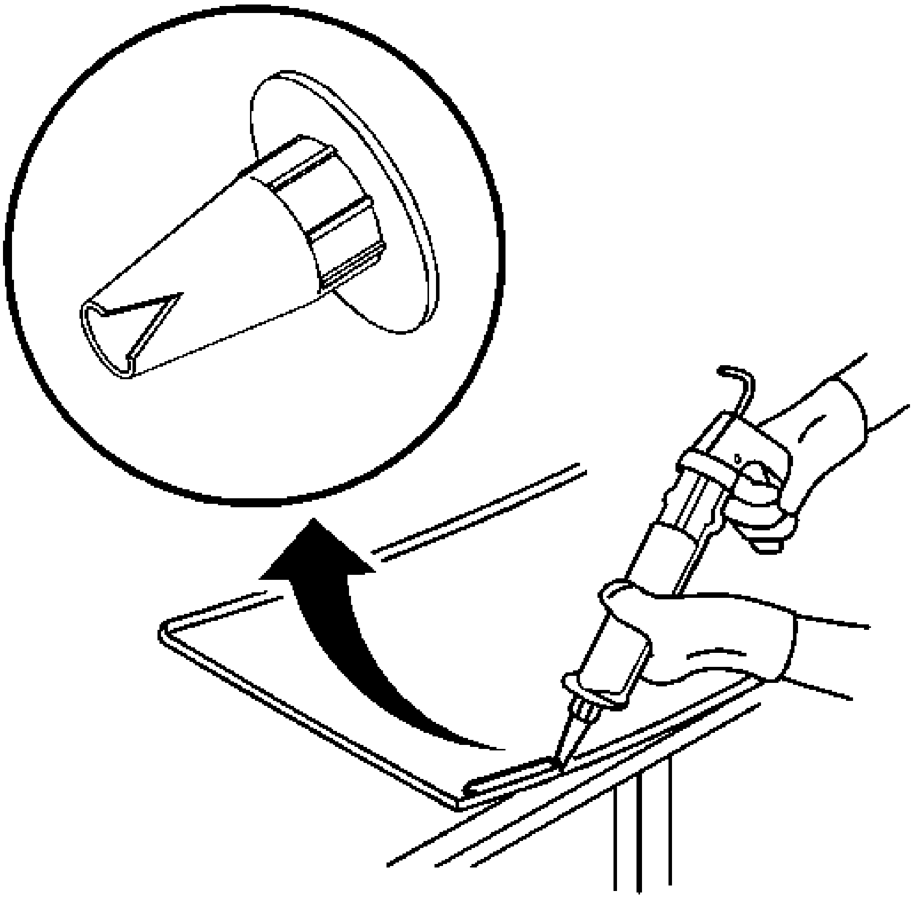

Fig. 82: Modified Applicator Nozzle
Courtesy of GENERAL MOTORS COMPANY

19. Cut the applicator nozzle in order to provide a bead of 12. 7 mm (1/2 in) wide and 12. 7 mm (1/2 in) high.

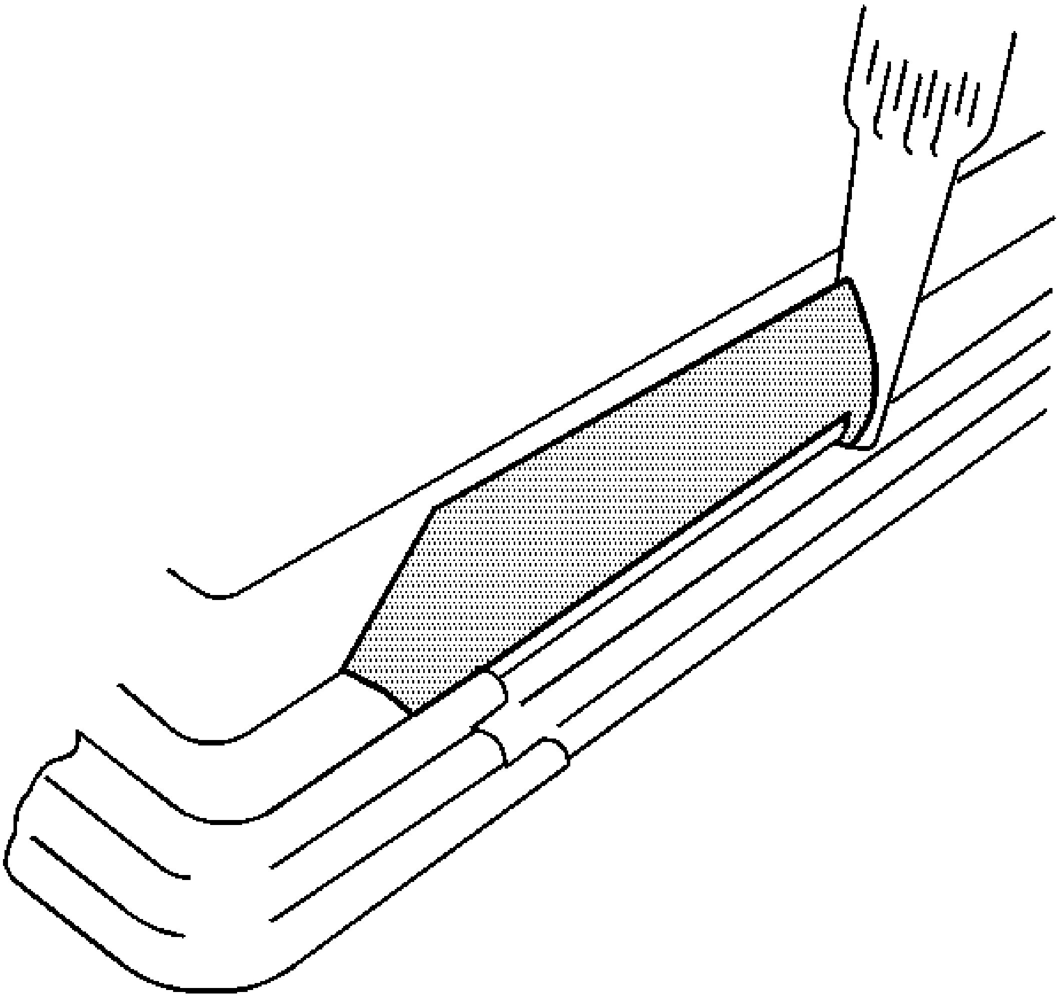

Fig. 83: Applying Continuous Bead Of Urethane Adhesive
Courtesy of GENERAL MOTORS COMPANY

20. Use a cartridge-type caulking gun in order to apply a smooth, continuous bead of urethane adhesive.

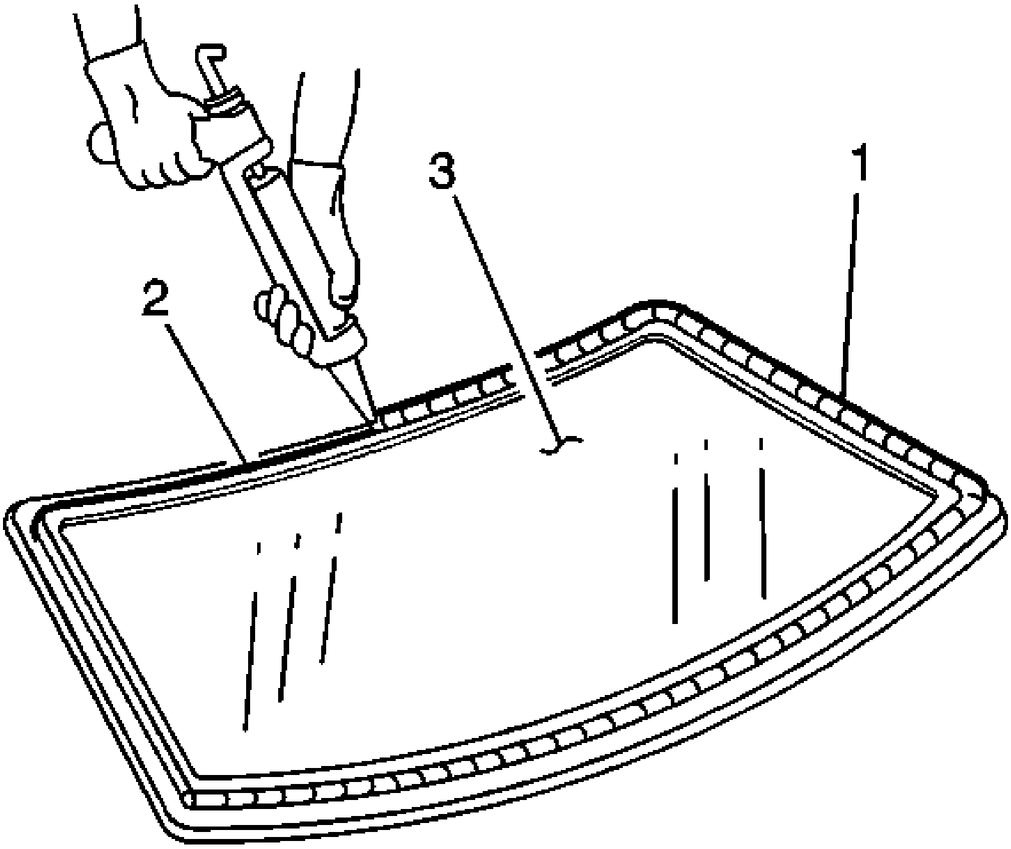

Fig. 84: Applying Urethane Adhesive To Inner Surface Of Window
Courtesy of GENERAL MOTORS COMPANY

21. Use the edge of the window as a guide for the nozzle in order to apply the urethane adhesive (1) to the inner surface of the window (3).
22. With the aid of an assistant, place the window in the opening.
23. Align the masking tape lines on the window and the body.

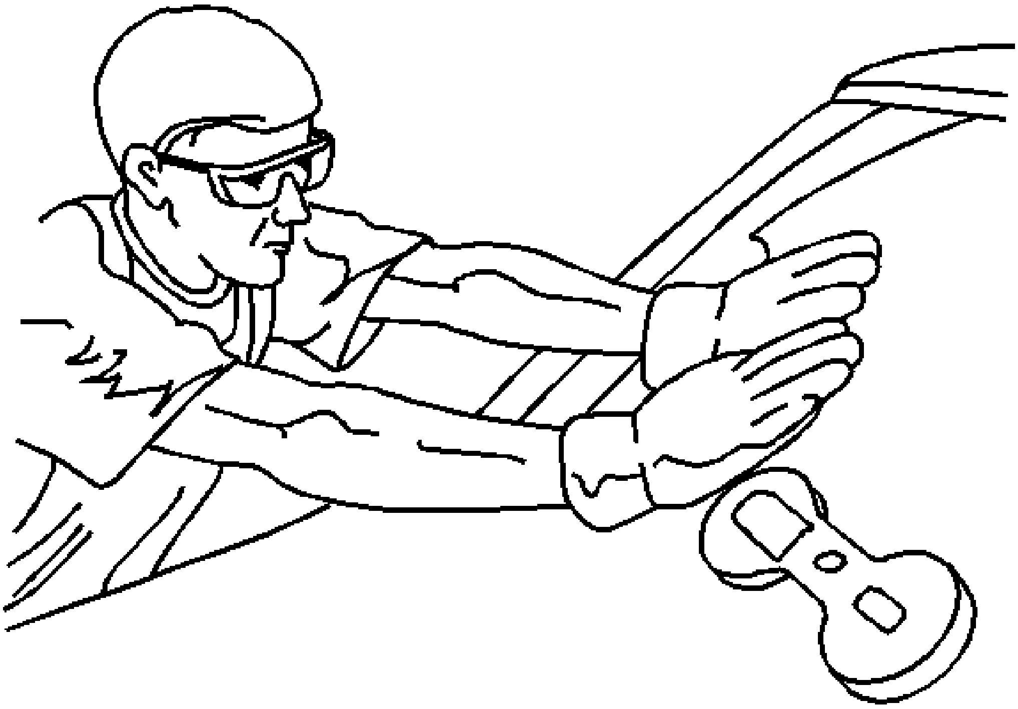

Fig. 85: Pressing Window Into Place
Courtesy of GENERAL MOTORS COMPANY

NOTE: **To prevent damage to the window due to objects impacting an exposed edge, upon installation, the window must rest 1 mm (0. 040 in) below the surface of the sheet metal.**

24. Press firmly around the entire periphery of the window in order to wet-out the urethane bead.
25. Tape the window to the body in order to minimize movement until the urethane adhesive cures.

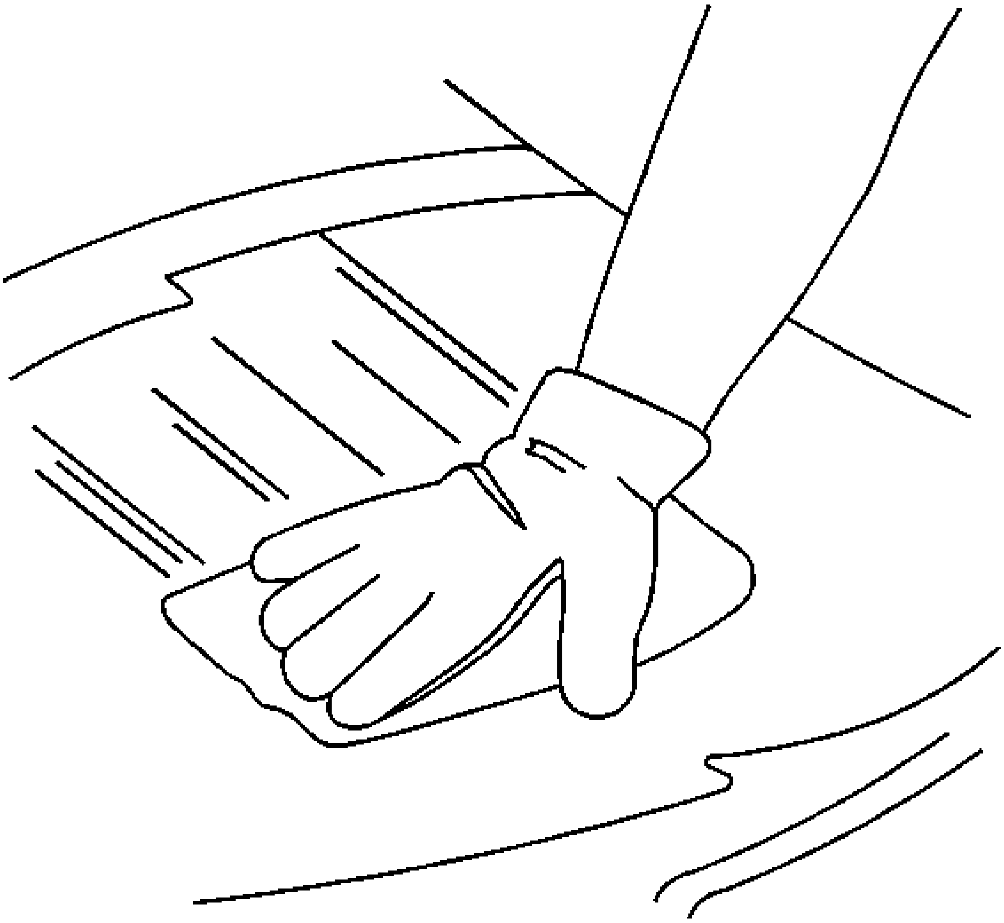

Fig. 86: Cleaning Excess Urethane Adhesive From Body
Courtesy of GENERAL MOTORS COMPANY

26. Clean any excess urethane adhesive from the body.

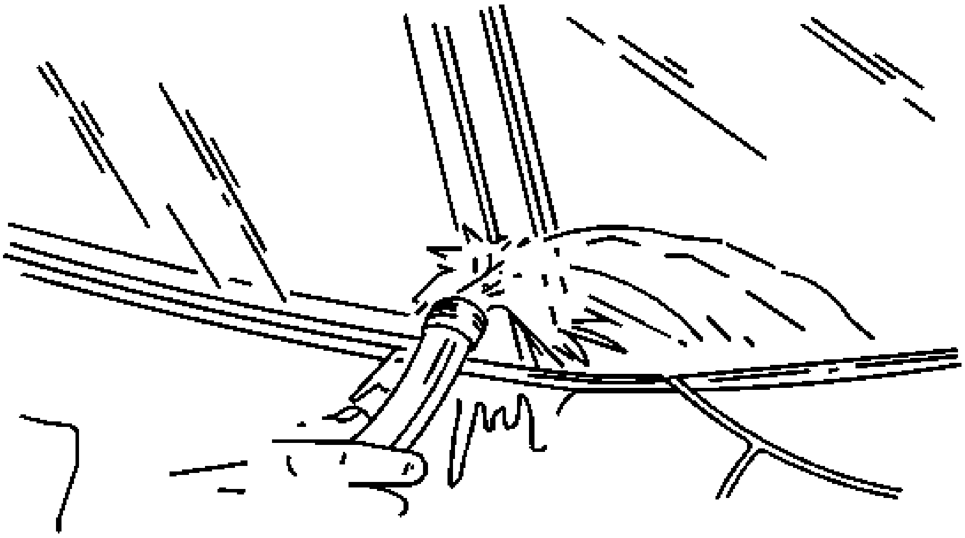

Fig. 87: Performing Water Hose Test
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do not direct a hard stream of high pressure water to the freshly applied urethane adhesive.**

27. Use a soft spray of warm water in order to immediately water test the window.
28. Inspect the window for leaks.
29. If any leaks are found, use a plastic paddle in order to apply extra urethane adhesive at the leak point.
30. Retest the window for leaks.

WARNING: **Insufficient curing of urethane adhesive may allow unrestrained occupants to be ejected from the vehicle resulting in personal injury.**

- **For the moisture-curing type of urethane adhesive, allow a minimum of 6 hours at 21Ã,Â°C (70Ã,Â°F) or greater and with at least 30 percent relative humidity. Allow at least 24 hours for the complete curing of the urethane adhesive.**
- **For the chemical-curing type of urethane adhesive, allow a minimum of 1 hour.**

Do NOT physically disturb the repair area until after these minimum times have elapsed.

31. Maintain the following conditions in order to properly cure the urethane adhesive:
    - Partially lower a door window in order to prevent pressure buildups when closing doors before the urethane adhesive cures.
    - Do not drive the vehicle until the urethane adhesive is cured. Refer to the above curing times.

- Do not use compressed air in order to dry the urethane adhesive.

32. Complete the window installation.

DESCRIPTION AND OPERATION

POWER WINDOWS DESCRIPTION AND OPERATION

Power Windows System Components

The power window system consists of the following components:

- Driver window/outside rearview mirror switch
- Passenger window switch
- Left rear window switch
- Right rear window switch
- Right rear door latch
- Left rear door latch
- Window motors in each of the doors
- 25A Fuse
- Body control module (BCM)

Driver Express Up and Express Down Power Window Motor

The driver door contains a window motor is smart motor that will detect excessive resistance while performing the express up function and automatically reverse direction to prevent injury to any occupants that may become trapped between the closing window and the door frame. The automatic reverse safety feature can be overridden by pulling and holding the window switch.

The logic circuit within the window motor monitors the up, down and express signal circuits which are normally equal to B+ voltage. When a switch is used on the driver window/outside rearview mirror switch, the contacts close causing a voltage drop within the appropriate signal circuit. The driver window motor will detect the voltage drop and will command the window to move in the direction requested.

Passenger, Left Rear and Right Rear Express Down Window Motors

For the passenger, right rear and left rear doors, when their window switch is pressed in the down position, battery positive voltage is applied to their respective window motor control circuit and ground to the other window motor control circuit causing that window to open. When the individual window switch is pulled in the up position, voltage and ground is applied to the window motor in the opposite direction causing that window to close. The return path to ground is supplied through the inactive control circuit being normally grounded through the window switch.

Each passenger and rear window switch communicates to the BCM by a serial data circuit. When the driver wishes to control the passenger, left rear or right rear window, the driver will use the appropriate switch on the driver window/outside rearview mirror switch. When this switch is used, a serial data message is sent to the BCM requesting a window motor command, the BCM will then send a serial data message to the appropriate door window switch which will then command that window to move in the direction requested.

Lockout Switch Feature

The driver window/outside rearview mirror switch contains a window lockout switch, when the driver presses the window lockout switch, a serial data message is sent to the BCM which will send a disable command to the rear window switches, the rear window switches will then ignore all functions when a passenger uses the rear window switch. The rear window motor commands will still function normally when the driver uses the appropriate switches on the driver window/outside rearview mirror switch.

REAR WINDOW DEFOGGER DESCRIPTION AND OPERATION

Rear Window Defogger System Components

The rear window defogger system consists of the following components:

- HVAC Control Module
- HVAC Controls Switch Assembly
- Rear Defogger Relay
- Rear Defogger Grid
- Driver Outside Rearview Mirror
- Passenger Outside Rearview Mirror
- 40A Fuse

Callout	Component Name
S34	S34 HVAC Controls Switch Assembly
E17D	E17D Outside Rearview Mirror Glass - Driver
E18	E18 Rear Defogger Grid
E17P	E17P Outside Rearview Mirror Glass - Passenger
K33	K33 HVAC Control Module

Rear Window Defogger Operation

The rear defog control system utilizes a single zone backlight design, driven with a single relay configuration. Additionally, up to two outside rear view mirrors can be heated if required. A switch for the customer to control the system is provided within the HVAC controls switch assembly. Also included in the HVAC controls switch assembly is an indicator to inform the customer with the current state of the system. The system is only operational when the vehicle is ON/RUN.

Pressing the heated rear window switch causes the HVAC controls switch assembly to send a serial data message to the HVAC control module requesting rear window defog operation. The HVAC control module upon receipt of the serial data message will provide voltage to the coil side of the rear defogger relay, this will energize the relay causing the relay switch contacts to close allowing B+ voltage to flow through the rear defogger grid control circuit to the rear defogger grid.

When the rear heated rear window switch is pressed and the vehicle is ON/RUN, the rear window defogger grid will activate and will turn off automatically depending upon the vehicle speed (refer to owner's manual for rear window defogger operation cycles)

Heated Mirrors

The heated mirrors are also controlled through the rear defogger relay. Whenever the rear window defogger is turned on battery voltage is supplied to the mirror heater elements through the left and right mirror heater element control circuits.

STATIONARY WINDOW DESCRIPTION

Most stationary windows, specifically windshields, are retained to the body with adhesive which adheres the window to the body, increasing structural integrity. The reinstallation of the windows with adhesive requires complete replacement of the adhesive bead, and is known as the full cut method. All stationary windows must use a adhesive systems which meet GM Specification GMW-15672.

URETHANE ADHESIVE DESCRIPTION

For replacement of any adhesive-installed window, use the full cut method only.

Use an adhesive that is approved by GM, Specification GMW-15672.

Use these materials based on specific manufacturer. Do NOT intermix primers or adhesives from one manufacturer to another.

Always follow the system manufacturers instructions for application, handling, and curing.

REPAIR INSTRUCTIONS

ELIMINATING UNWANTED ODORS IN VEHICLES

GM Vehicle Care Odor Eliminator, Refer to Adhesives, Fluids, Lubricants, and Sealers, may control or eliminate odors in the interior and luggage compartment areas of GM vehicles. This non-toxic, biodegradable, odorless product has been shown to greatly reduce or remove the following types of odor:

- Objectionable smells of mold and mildew resulting from vehicle water leaks
- Customer created odors, such as smoke

You may safely use GM Vehicle Care Odor Eliminator on fabrics, vinyl, leather, carpet, and sound deadening materials. You may also induce this product into HVAC modules and instrument panel ducts for the control of non-bacterial related odors.

NOTE: **This product leaves no residual scent and should not be used as an air freshener.**

This product may result in the permanent elimination of an odor and may be preferable to customers whose allergies make them sensitive to perfumes. This product may effectively remove odors when directly contacting the odor source. In cases such as water leaks, use this product with diagnostic procedures to first eliminate the primary cause of the odor. Then use further applications on the residual odor to permanently correct the vehicle condition.

How to Use this Product

- Spray GM Vehicle Care Odor Eliminator directly or as an additive with carpet shampoo in steam cleaners.
- Do not use on any interior surface that plain water would deteriorate, because this product will have the same effect. Also avoid letting this product come into contact with vinegar or any acidic substance. Acid-based products will hamper the effectiveness of GM Vehicle Care Odor Eliminator.
- Complete eight page treatment sheets are enclosed within each case of GM Vehicle Care Odor Eliminator. These treatment instructions range from simple vehicle odor elimination to full step by step procedures for odor removal from water leaks.
- Instructions and cautions are printed on the bottle, but additional help is available. If you encounter a persistent or recurring odor, you may call to obtain additional information and usage suggestions.

FLOOR CARPET DRYING

If the carpet or the pad or insulator is wet, use the following criteria for drying or for replacing the components:

- For a 1-piece carpet assembly bonded to a cotton or a fiber padding, replace the entire assembly.
- For a 2-piece carpet assembly with a cotton or a fiber padding, replace the padding only. While the carpet is out of the vehicle, dry the carpet using the method described below.
- For a 1-piece carpet assembly bonded to a foam padding or attached to a synthetic padding, dry the carpet using the method described below.
- For a 2-piece carpet assembly with a synthetic padding, dry the assembly using the method described below.

Drying Method

1. If you observe puddles of liquid on the carpet face, use a wet vacuum to remove the excess moisture.
2. Blot the face of the carpet with a towel in order to absorb as much moisture as possible.
3. Point a fan at the affected area and air dry the carpet.

FLOOR PANEL CARPET REPLACEMENT

Removal Procedure

1. Battery Negative Cable - Disconnect - **Battery Negative Cable Disconnection and Connection**
2. Remove the driver and passenger seat. **Driver or Passenger Seat Removal and Installation**
3. Remove the rear seat cushion. **Rear Seat Cushion Removal and Installation**

FLOOR CARPET AUXILIARY MAT RETAINER REPLACEMENT

Removal Procedure

WARNING: **Wear safety glasses in order to avoid eye damage.**

1. Front Side Door Sill Garnish Molding - Remove - **Front Side Door Sill Garnish Molding Replacement**
2. Reposition the floor panel carpet as needed to access retainers. **Floor Panel Carpet Replacement**

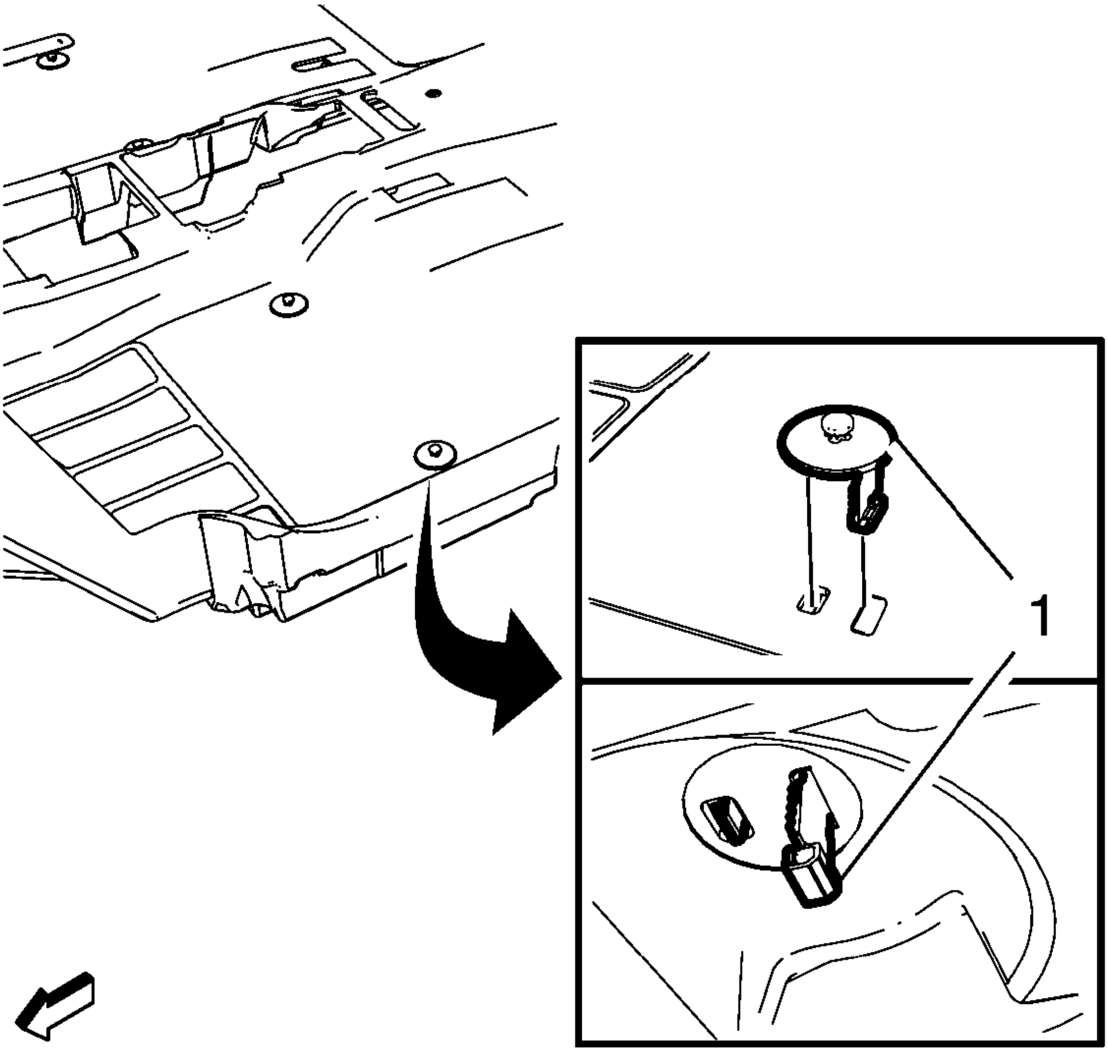

Fig. 13: Floor Panel Carpet Retainer
Courtesy of GENERAL MOTORS COMPANY

3. Disengage the floor carpet auxiliary mat retainer (1) on the rear side of the floor panel carpet.
4. Remove the floor carpet auxiliary mat retainer (1) upwards.

Installation Procedure

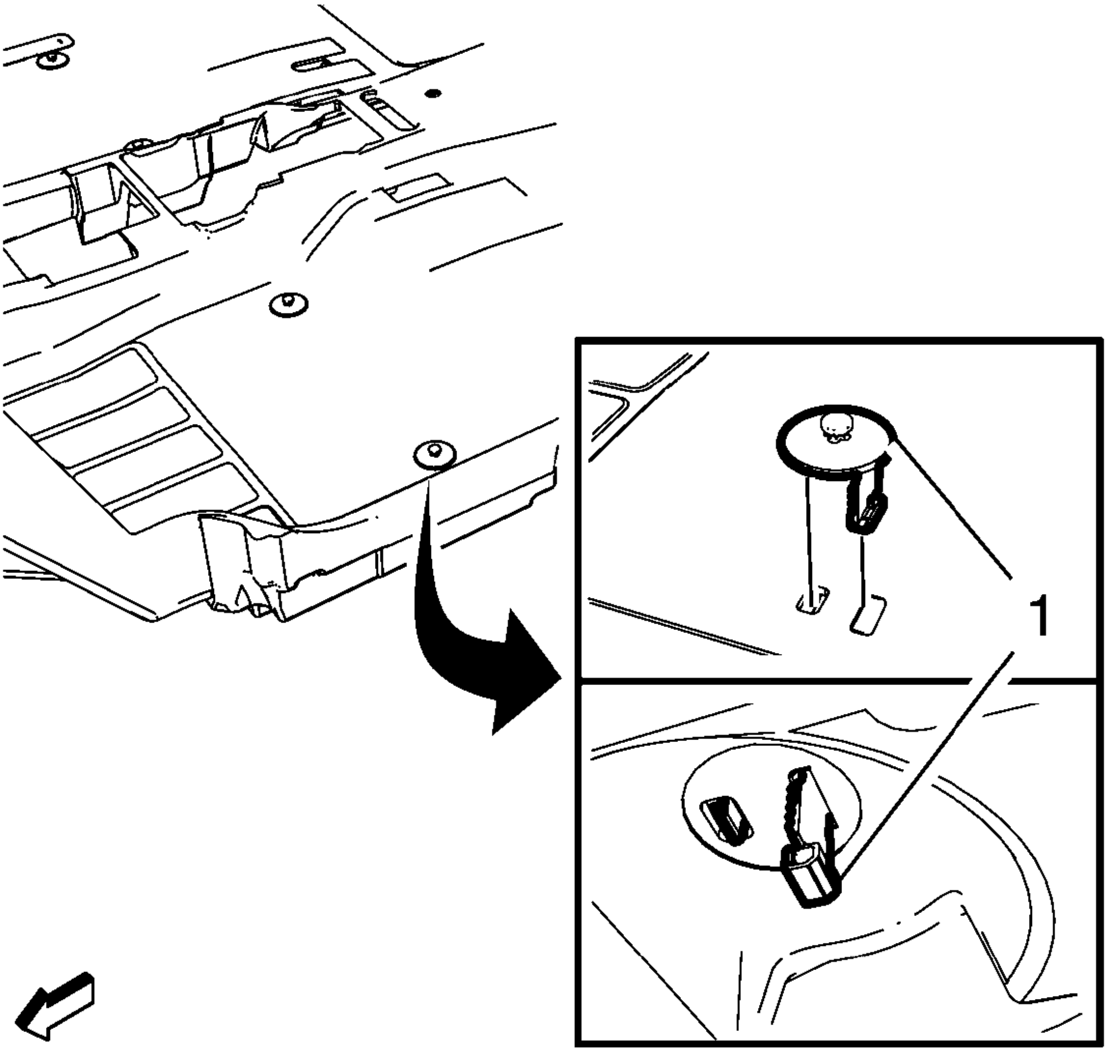

Fig. 14: Floor Panel Carpet Retainer
Courtesy of GENERAL MOTORS COMPANY

1. Align the floor carpet auxiliary mat retainer (1) to the cutout in the carpet.
2. Engage the floor carpet auxiliary mat retainer (1) on the rear side of the floor panel carpet.
3. Reposition the floor panel carpet as needed. **Floor Panel Carpet Replacement**
4. Front Side Door Sill Garnish Molding - Install - **Front Side Door Sill Garnish Molding Replacement**

DRIVER FOOTREST REPLACEMENT

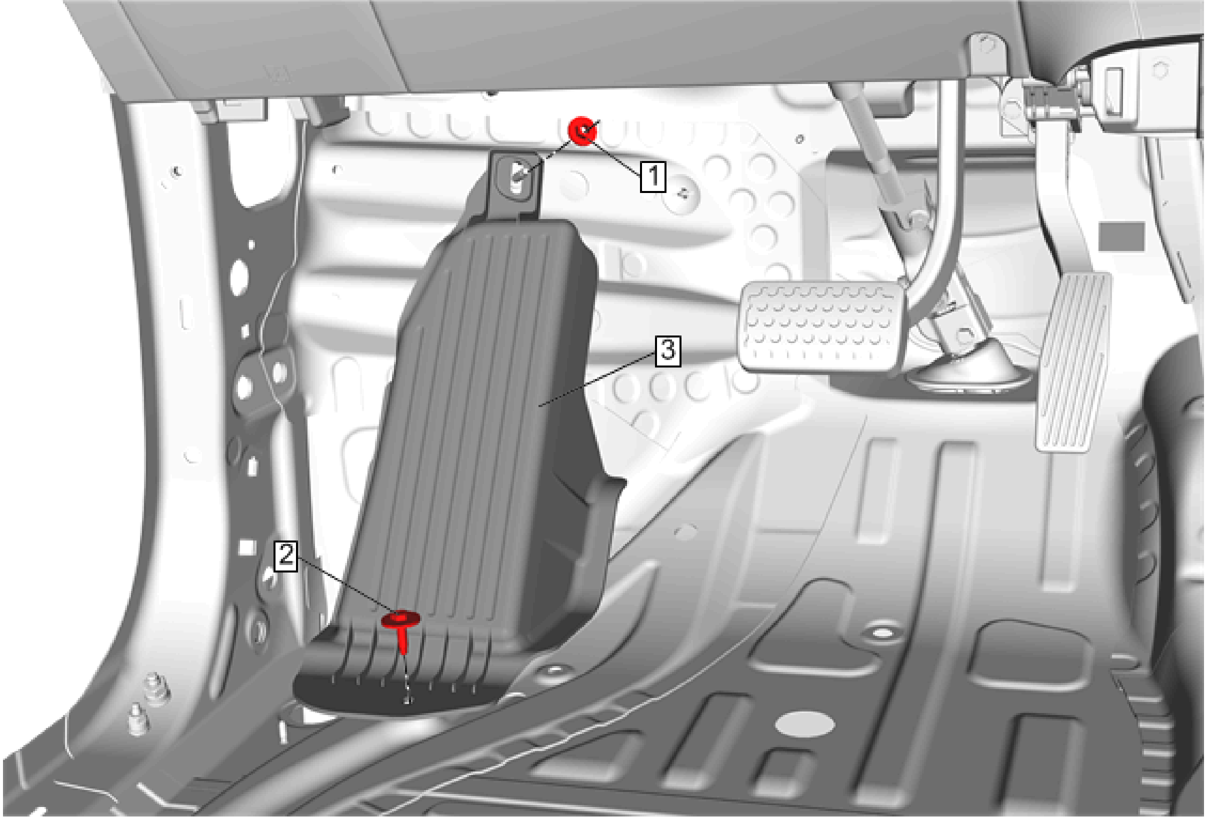

Fig. 15: Driver Footrest
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Reposition the driver side portion of the floor carpet. Floor Panel Carpet Replacement	
1	Driver Footrest Nut **CAUTION:** **Refer to Fastener Caution .** **Tighten** 9 N.m (80 lb in)
2	Driver Footrest Bolt **Tighten** 6 N.m (53 lb in)
3	Driver Footrest

HEADLINING TRIM PANEL REPLACEMENT

Removal Procedure

WARNING: **Do not attempt to repair or alter the head impact energy-absorbing material glued to the headliner or to the garnish trims. If the material is damaged, replace the headliner and/or the garnish trim. Failure to do so could result in personal injury.**

CAUTION: **If a vehicle is equipped with a head curtain inflator module ensure that the inflator module and tether are undamaged. If tether or curtain airbag are damaged in any way, they must be replaced.**

CAUTION: **Use care when working around the head curtain inflator module. Sharp tools may puncture the curtain airbag. If the head curtain inflator module is damaged in any way, it must be replaced.**

NOTE: **If removing the right side harness from the vehicle that goes to the**

radio, then the headliner, I/P, and radio must be removed. If removing left side harness from vehicle, only I/P needs to be removed. If only just removing the headliner, then the harnesses can be removed from the headliner and left to hang.

NOTE: **Prior to removal, note the routing of the wire harness to aid in reassembly and to ensure proper installation.**

14. Remove the headliner trim panel retainers (1).
15. Release the headliner from the door weatherstrip and lower.
16. Disconnect the electrical connectors.
17. Note the location of the harness and remove the harness from the headliner. **Headliner Harness Replacement**
18. With the aid of an assistant, remove the headliner trim panel assembly (2) from the vehicle through the liftgate opening.
19. Transfer components as necessary.
20. If transferring or replacing the wiring harness. **Headliner Harness Replacement**

Installation Procedure

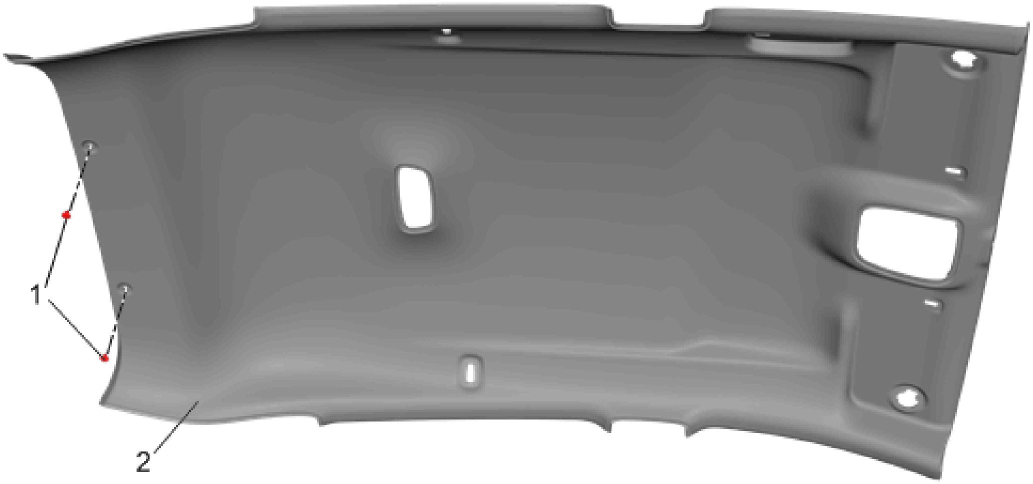

Fig. 27: Headliner Trim Panel Retainers
Courtesy of GENERAL MOTORS COMPANY

1. With the aid of an assistant, position the headliner trim panel assembly (2) into the vehicle through the liftgate opening.
2. Install the harnesses to the headliner.
3. Connect the electrical connectors.
4. Tape any unused connectors to the headlining with a high adhesive tape.
5. Raise the headliner into position and install around weatherstrips.
6. Install the headliner trim panel retainers (1).

HEADLINER HARNESS REPLACEMENT

Removal Procedure

1. For the left side harness, remove the instrument panel. **Instrument Panel Assembly Replacement**
2. For the right side harness, remove the instrument panel and radio. **Instrument Panel Assembly Replacement** , **Radio Replacement**
3. Remove the headlining trim panel. Refer to **Headlining Trim Panel Replacement**.
4. Take note of the wiring harness locations and measure the harness lead length prior to removing. Mark harness routing locations on new headliner prior to harness removal.

NOTE: **Use a camera to take pictures and use a pencil to mark the new headliner.**

5. Use fiber or plastic trim tool to assist in removing the wiring harness from the headliner, taking care not to damage the harness.
6. Remove excess glue and material from the wiring harness and re-tape areas where the tape was removed or damaged.

Installation Procedure

1. Lay the wiring harness on the new headliner assembly to confirm correct routing and ensure harness leads are proper length for mating connections prior to gluing.

WARNING: **Do not change the wiring harness routing locations. Correct harness routing is critical for air bag deployment. Possible personal injury or vehicle damage could result if the harness routing is changed.**

NOTE: **When installing a new headliner harness, tape any unused connector to the headliner with a high adhesive tape.**

2. Use hot melt adhesive to install the wiring harness. Apply insulator tape over glued locations to prevent squeaks and rattles as needed.
3. Install the headlining trim panel. Refer to **Headlining Trim Panel Replacement**.
4. For the left side harness, install the instrument panel. **Instrument Panel Assembly Replacement**
5. For the right side harness, install the instrument panel and radio. **Instrument Panel Assembly Replacement** , **Radio Replacement**

Rear Tire Front Air Deflector Fastener	2.5 N.m (22 lb in)
Rear Wheelhouse Liner Screw	2.5 N.m (22 lb in)

REPAIR INSTRUCTIONS

POWER ELECTRIC CARRIER FRAME REPLACEMENT

Removal Procedure

WARNING: **Always perform the High Voltage Disabling procedure prior to servicing any High Voltage component or connection. Personal Protection Equipment (PPE) and proper procedures must be followed.**

The High Voltage Disabling procedure includes the following steps:

- **Identify how to disable high voltage.**
- **Identify how to test for the presence of high voltage.**
- **Identify condition under which high voltage is always present and personal protection equipment (PPE) and proper procedures must be followed.**

Before working on any high voltage system, be sure to wear the following Personal Protection Equipment:

- **Safety glasses with appropriate side shields when within 15 meters (50 feet) of the vehicle, either indoors or outdoors.**
- **Certified and up-to-date Class "0" Insulation gloves rated at 1000V with leather protectors.**
  - **Visually and functionally inspect the gloves before use.**
  - **Wear the Insulation gloves with leather protectors at all times when working with the high voltage battery assembly, whether the system is energized or not.**

Failure to follow the procedures may result in serious injury or death.

1. Disable the high voltage system. High Voltage Disabling
2. Battery Tray - Remove - Battery Tray Replacement

33. Drive Motor Battery Coolant Pump Nut - Remove
34. Support the drive motor battery coolant pump (2) to the power electric carrier frame with a wire.
35. Disconnect both of the steering gear tie rod ends from the steering knuckle. **Steering Linkage Outer Tie Rod Replacement**
36. Remove both of the stabilizer shaft links. **Stabilizer Shaft Link Replacement**
37. Disconnect both of the control arm ball joints from the steering knuckles. **Lower Control Arm Replacement**
38. Remove both of the front wheel drive shaft. **Front Wheel Drive Shaft Replacement**

39. Electrical Connector at Automatic Transmission Fluid Pump - Disconnect
40. Engine Wiring Harness Retainer at Drive Motor Housing Assembly - Unclip

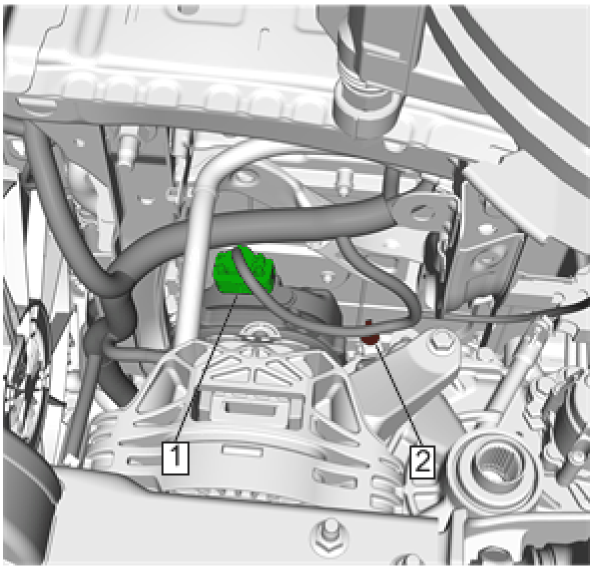

Fig. 46: Electrical Connector at Automatic Transmission Range Select Actuator Hardware Module
Courtesy of GENERAL MOTORS COMPANY

41. Electrical Connector at Automatic Transmission Range Select Actuator Hardware Module - Disconnect
42. Engine Wiring Harness Retainer at Drive Motor Housing Assembly - Unclip

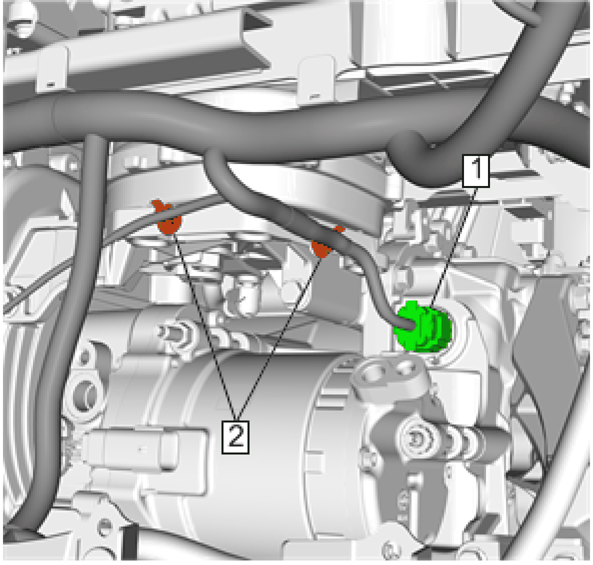

Fig. 47: Electrical Connector at Automatic Transmission
Courtesy of GENERAL MOTORS COMPANY

43. Electrical Connector at Automatic Transmission - Disconnect
44. Engine Wiring Harness Retainer at Automatic Transmission Range Select Actuator Hardware Module - Unclip

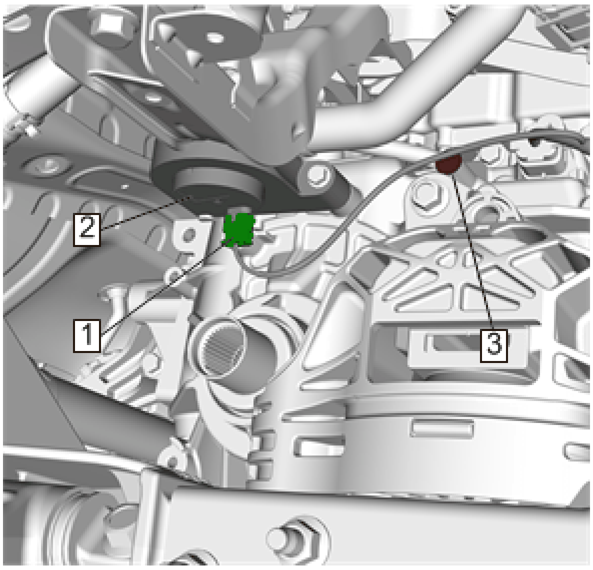

Fig. 48: Electrical Connector at Heater Coolant Pump
Courtesy of GENERAL MOTORS COMPANY

45. Electrical Connector at Heater Coolant Pump - Disconnect
46. Engine Wiring Harness Retainer at Automatic Transmission Case - Unclip

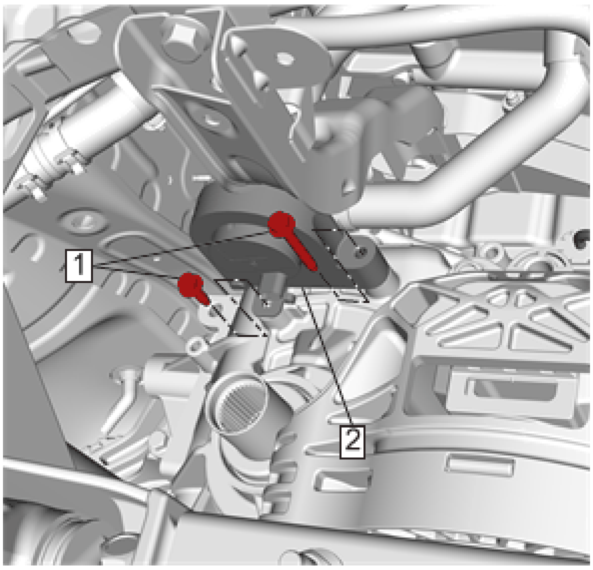

Fig. 49: Heater Coolant Pump Bolt at Automatic Transmission
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Do NOT disconnect the coolant hose.**

47. Heater Coolant Pump Bolt at Automatic Transmission - Remove
48. Support the heater coolant pump (2) to the power electric carrier frame with a wire.

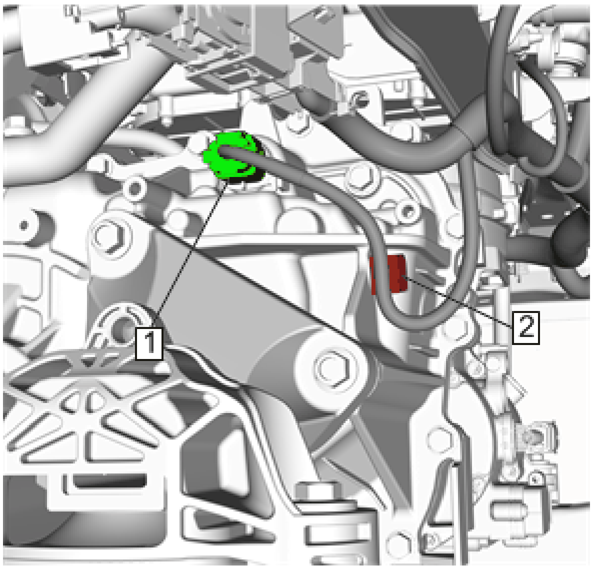

Fig. 50: Electrical Connector at Automatic Transmission Shift Shaft Position Switch
Courtesy of GENERAL MOTORS COMPANY

49. Electrical Connector at Automatic Transmission Shift Shaft Position Switch - Disconnect
50. Engine Wiring Harness Retainer at Automatic Transmission Case - Unclip

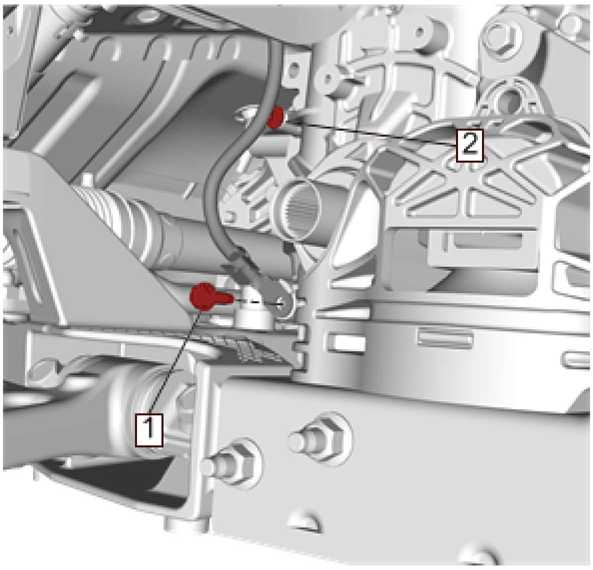

Fig. 51: Battery Negative Cable Ground Bolt at Automatic Transmission Case
Courtesy of GENERAL MOTORS COMPANY

51. Battery Negative Cable Ground Bolt at Automatic Transmission Case - Remove
52. Battery Negative Cable Retainer at Automatic Transmission Case - Unclip

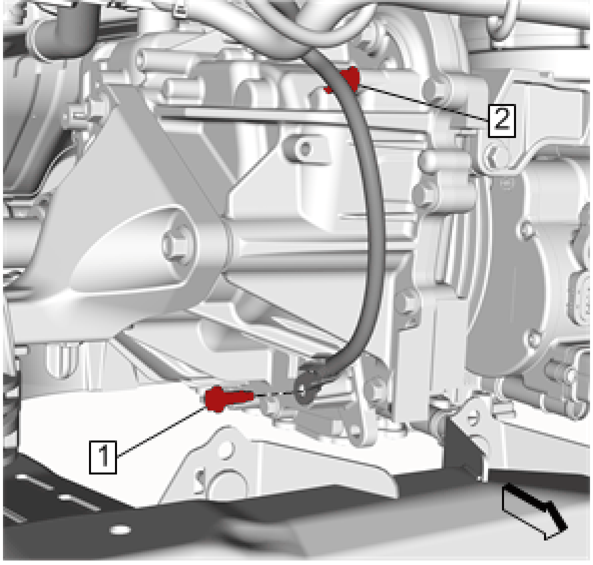

Fig. 52: Battery Negative Cable Ground Bolt at Automatic Transmission Case
Courtesy of GENERAL MOTORS COMPANY

53. Battery Negative Cable Ground Bolt at Automatic Transmission Case - Remove
54. Battery Negative Cable Retainer at Automatic Transmission Case - Unclip

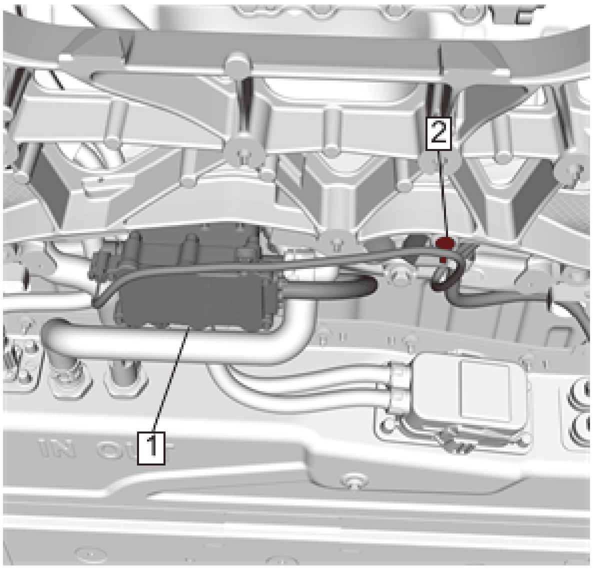

Fig. 53: High Voltage Battery Heater at Vehicle
Courtesy of GENERAL MOTORS COMPANY

55. High Voltage Battery Heater at Vehicle - Remove - High Voltage Battery Heater Replacement
56. Wiring Harness Retainer at Drivetrain and Front Suspension Frame - Unclip
57. Secure the condenser, radiator and fan module to the upper body structure with a suitable strap.

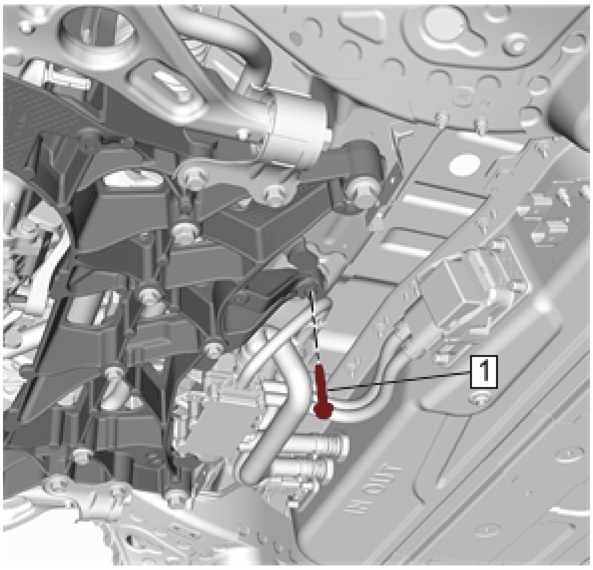

Fig. 54: Drivetrain and Front Suspension Crossmember Center Bolt
Courtesy of GENERAL MOTORS COMPANY

58. Drivetrain and Front Suspension Crossmember Center Bolt - Remove

NOTE: **Blocks of wood can be used on the table to level the powertrain during the removal.**

59. Position a powertrain support table under the powertrain assembly.
60. With the table positioned, fully raise the table to contact with the powertrain assembly.

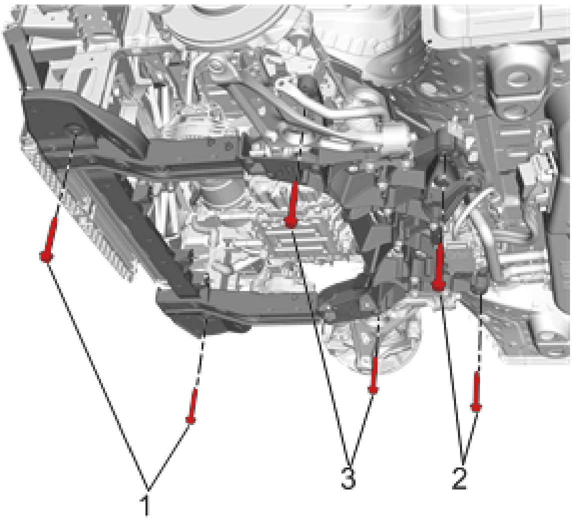

Fig. 55: Drivetrain and Front Suspension Cradle Front Bolt
Courtesy of GENERAL MOTORS COMPANY

61. Drivetrain and Front Suspension Cradle Front Bolt (1) (Qty: 2) - Remove
62. Drivetrain and Front Suspension Cradle Rear Bolt (2) (Qty: 2) - Remove
63. Drivetrain and Front Suspension Cradle Intermediate Bolt (3) (Qty: 2) - Remove

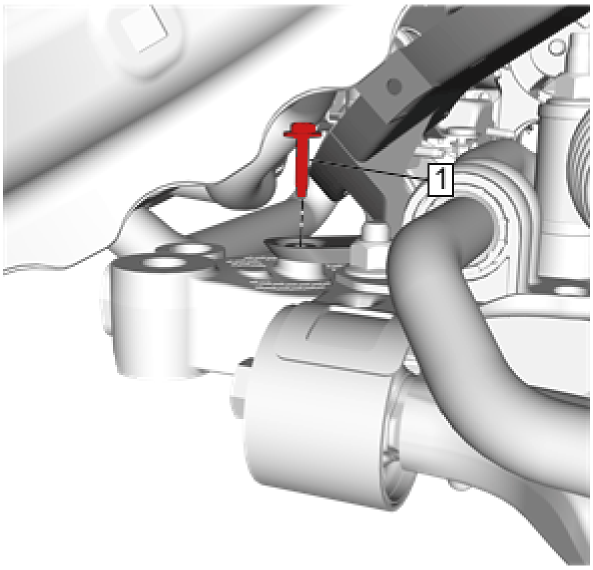

Fig. 56: Battery Positive and Negative Cable Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

NOTE: **Ensure that the harnesses and hoses are clear, and do not become stuck on anything as the front suspension frame assembly is being lowered.**

64. Partially lower the powertrain support table to get an access to the battery positive and negative cable bracket bolt.
65. Battery Positive and Negative Cable Bracket Bolt (1) - Remove

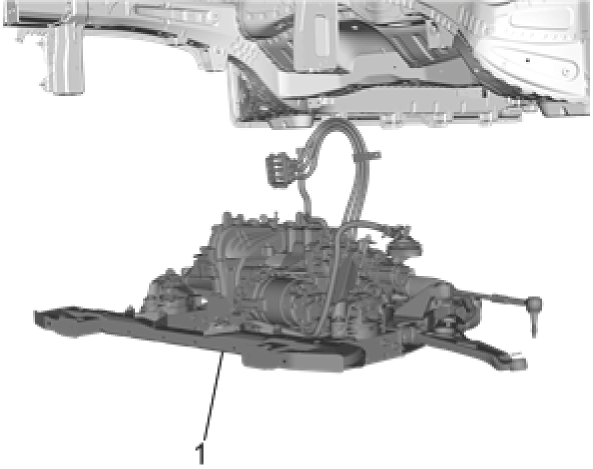

Fig. 57: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly
Courtesy of GENERAL MOTORS COMPANY

66. Carefully lower the powertrain support table and raise the vehicle on the hoist to separate the automatic transmission and drivetrain and front suspension frame assembly (1) from the vehicle.
67. Remove the automatic transmission as necessary. **Transmission Replacement**

Installation Procedure

1. Install the automatic transmission as necessary. **Transmission Replacement**

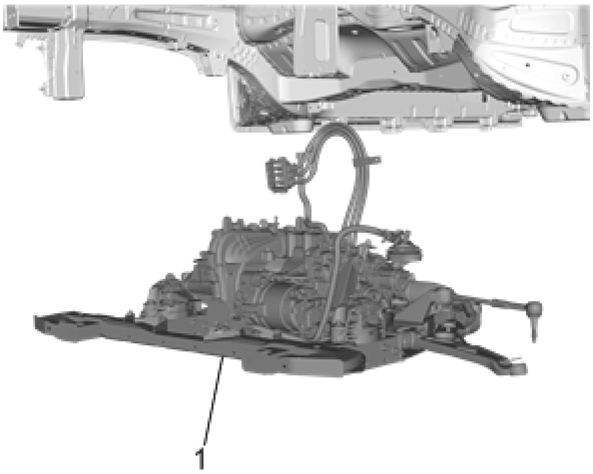

Fig. 58: Automatic Transmission and Drivetrain and Front Suspension Frame Assembly
Courtesy of GENERAL MOTORS COMPANY

2. Carefully raise the powertrain support table and lower the vehicle on the hoist to install the automatic transmission and drivetrain and front suspension frame assembly (1) to the vehicle.

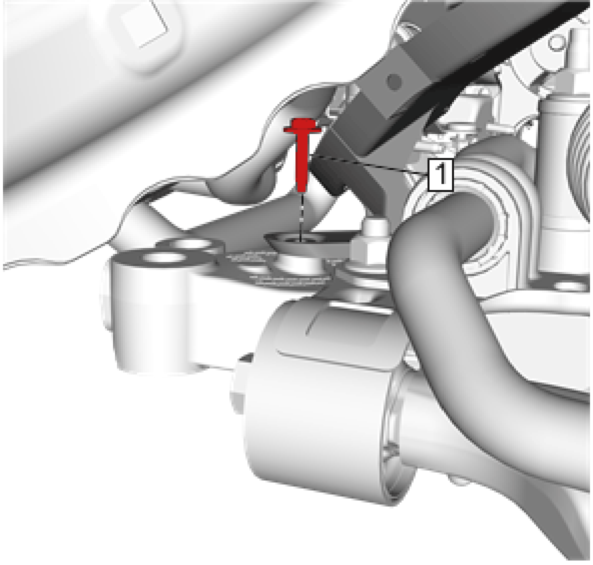

Fig. 59: Battery Positive and Negative Cable Bracket Bolt
Courtesy of GENERAL MOTORS COMPANY

CAUTION: Fastener Caution

3. Battery Positive and Negative Cable Bracket Bolt (1) - Install and tighten to 9 N.m (80 lb in)

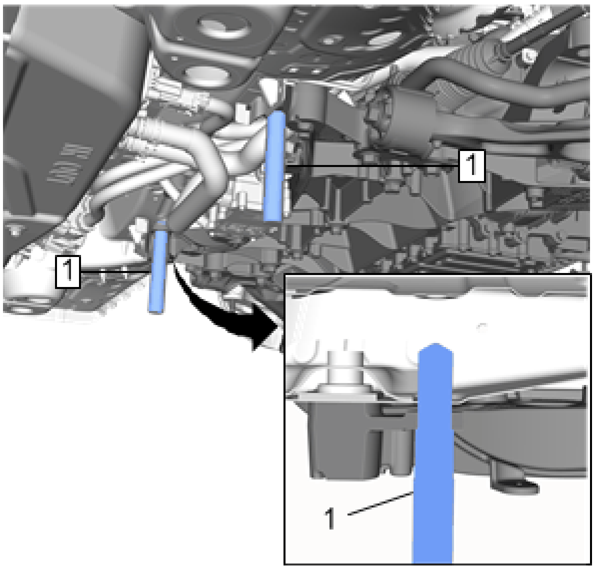

Fig. 60: Special Tool Cradle Alignment Guide Pins
Courtesy of GENERAL MOTORS COMPANY

4. Using the CH-51034 Cradle Alignment Guide Pins (1), have an assistant vertically insert and hold the pins through the front suspension cradle and floor panel.

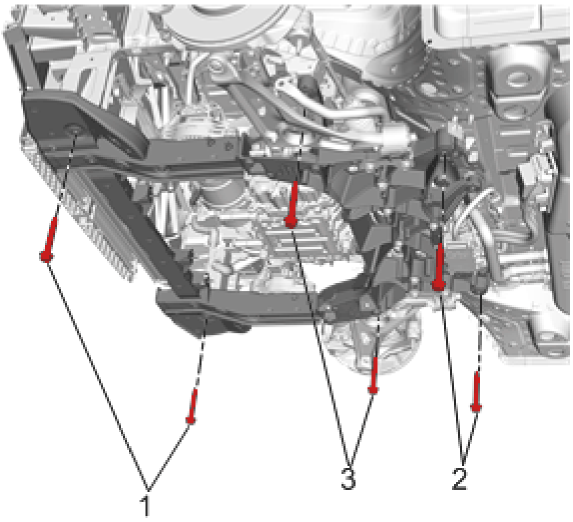

Fig. 61: Drivetrain and Front Suspension Cradle Front Bolt
Courtesy of GENERAL MOTORS COMPANY

5. Drivetrain and Front Suspension Cradle Intermediate Bolt (3) (Qty: 2) - Install and tighten
    1. First Pass: 160 N.m (118 lb ft)
    2. Final Pass: 60 - 75 Degrees
6. Drivetrain and Front Suspension Cradle Rear Bolt (2) (Qty: 2) - Install and tighten
    1. First Pass: 160 N.m (118 lb ft)
    2. Final Pass: 60 - 75 Degrees
7. Drivetrain and Front Suspension Cradle Front Bolt (1) (Qty: 2) - Install and tighten
    1. First Pass: 160 N.m (118 lb ft)
    2. Final Pass: 60 - 75 Degrees
8. Remove the powertrain support table.

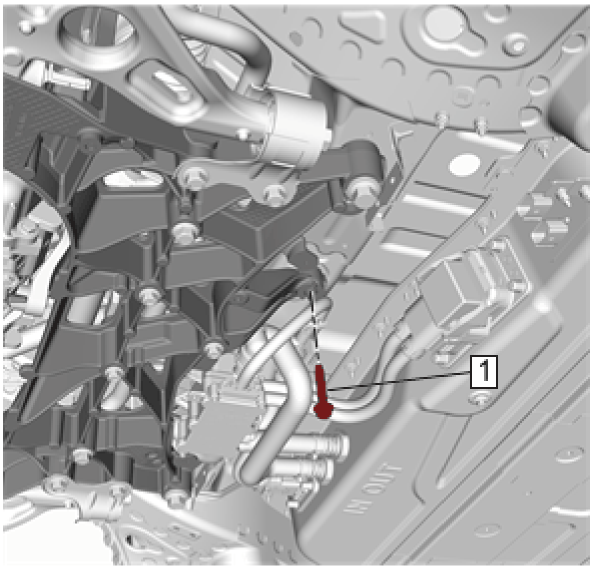

Fig. 62: Drivetrain and Front Suspension Crossmember Center Bolt
Courtesy of GENERAL MOTORS COMPANY

9. Drivetrain and Front Suspension Crossmember Center Bolt (1) - Install and tighten to 58 N.m (43 lb ft)
10. Remove the strap which secures the condenser, radiator and fan module from the upper body structure.

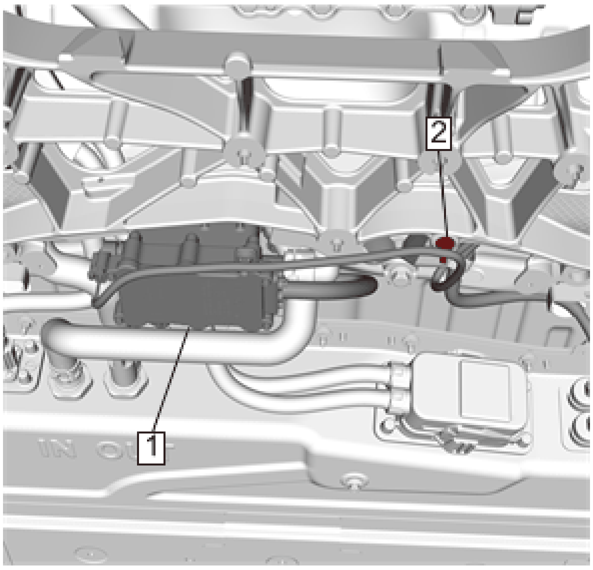

Fig. 63: High Voltage Battery Heater at Vehicle

62. Dash Panel Upper Extension Panel Extension - Install - **Dash Panel Upper Extension Panel Extension Replacement**

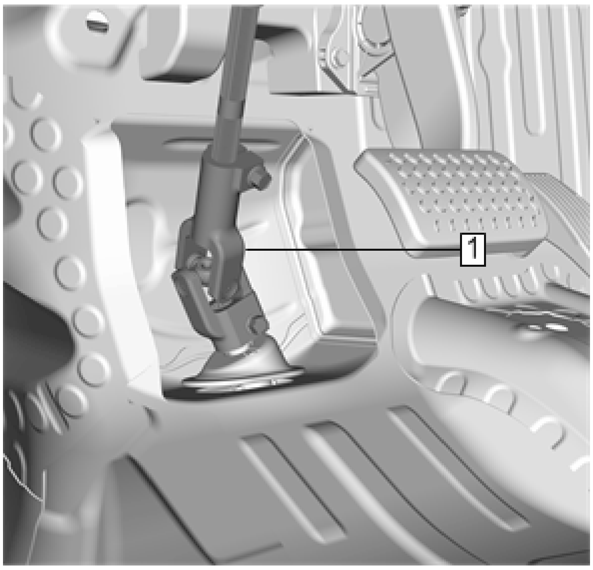

Fig. 86: Intermediate Steering Shaft
Courtesy of GENERAL MOTORS COMPANY

63. Connect the intermediate steering shaft (1) to the steering gear. **Intermediate Steering Shaft Replacement**
64. Fill the drive motor generator power inverter module cooling system. **Drive Motor Generator Power Inverter Module Cooling System Draining and Filling**
65. Recharge the refrigerant. **Refrigerant Recovery and Recharging**
66. Enable the high voltage system. **High Voltage Enabling**
67. Center the steering angle sensor. **Steering Wheel Angle Sensor Centering**
68. Measure the wheel alignment. **Wheel Alignment Measurement**

FRONT WHEELHOUSE LINER REPLACEMENT

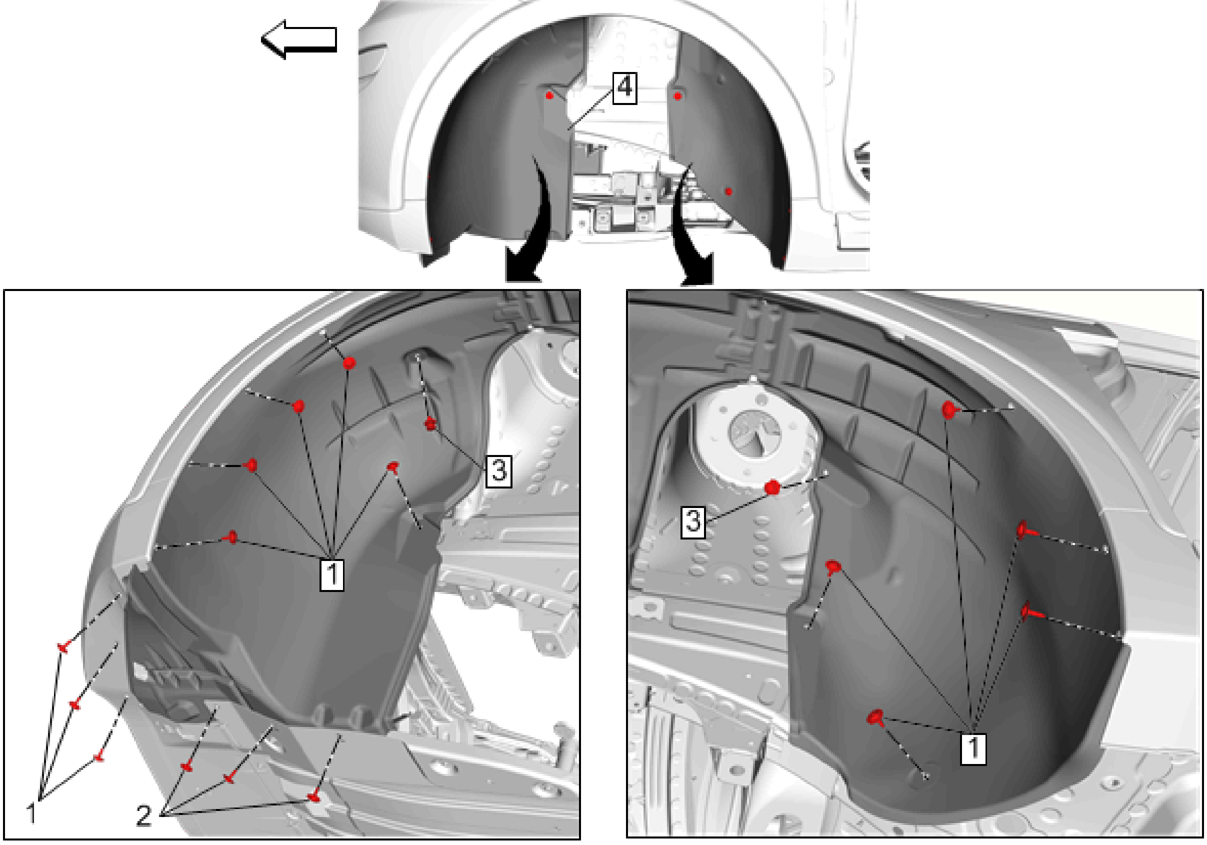

Fig. 87: Front Wheelhouse Liner
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Tire and Wheel Removal and Installation	
1	Front Wheelhouse Liner Screw (Qty: 13) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Front Bumper Fascia Wheel Opening Screw (Qty: 3) **Tighten** 2.5 N.m (22 lb in)
3	Front Wheelhouse Liner Retainer (Qty: 2)
4	Front Wheelhouse Liner

REAR WHEELHOUSE LINER REPLACEMENT

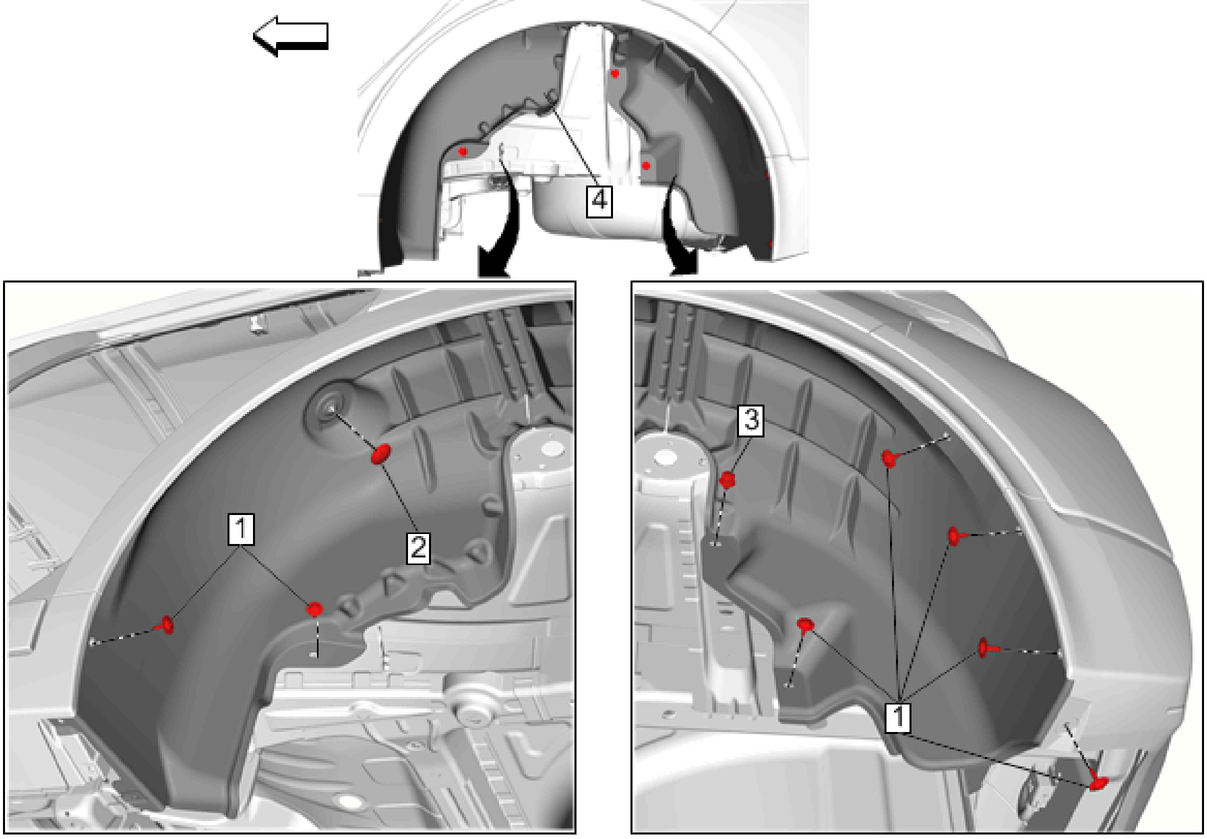

Fig. 88: Rear Wheelhouse Liner
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Tire and Wheel Removal and Installation 2. Rear Tire Front Air Deflector Replacement	
1	Rear Wheelhouse Liner Screw (Qty: 7) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Rear Wheelhouse Liner Retainer
3	Rear Wheelhouse Liner Push-Pin
4	Rear Wheelhouse Liner

FRONT TIRE FRONT AIR DEFLECTOR REPLACEMENT

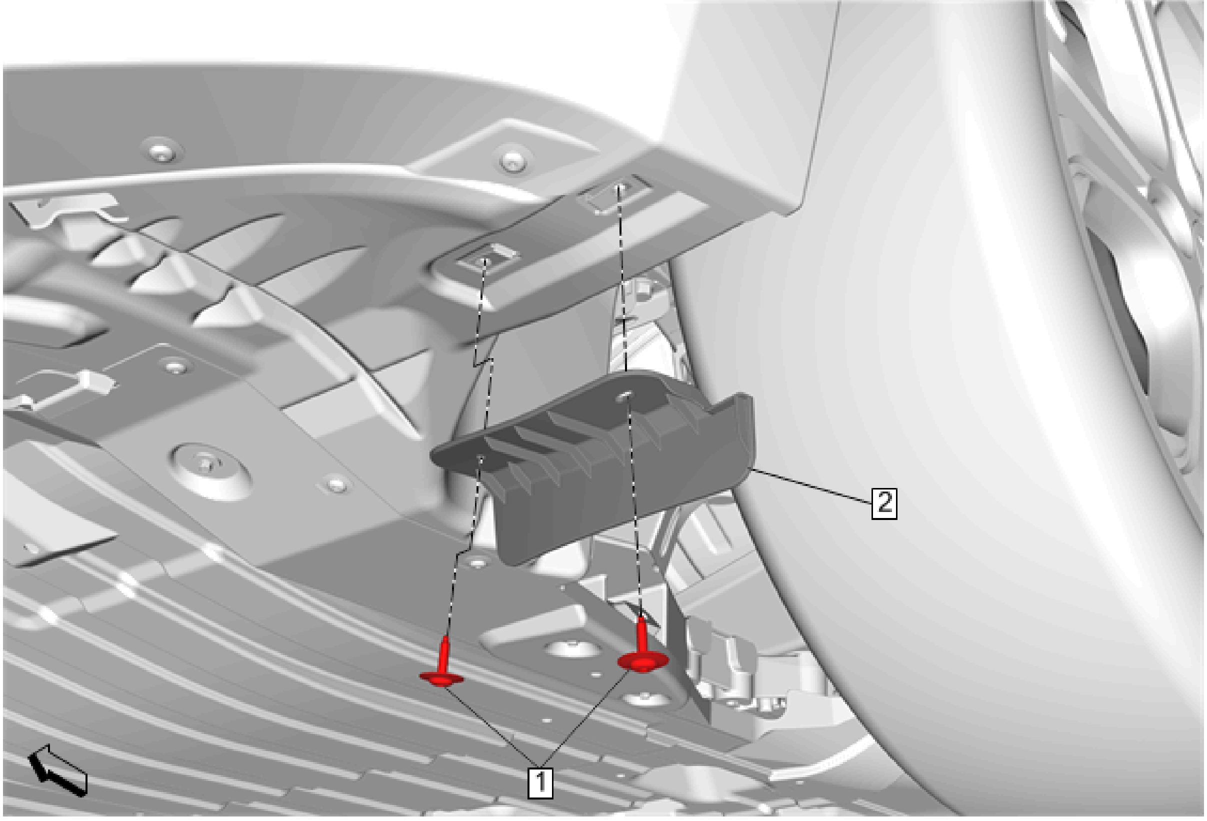

Fig. 89: Front Tire Front Air Deflector
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Tire Front Air Deflector Fastener (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Front Tire Front Air Deflector

REAR TIRE FRONT AIR DEFLECTOR REPLACEMENT

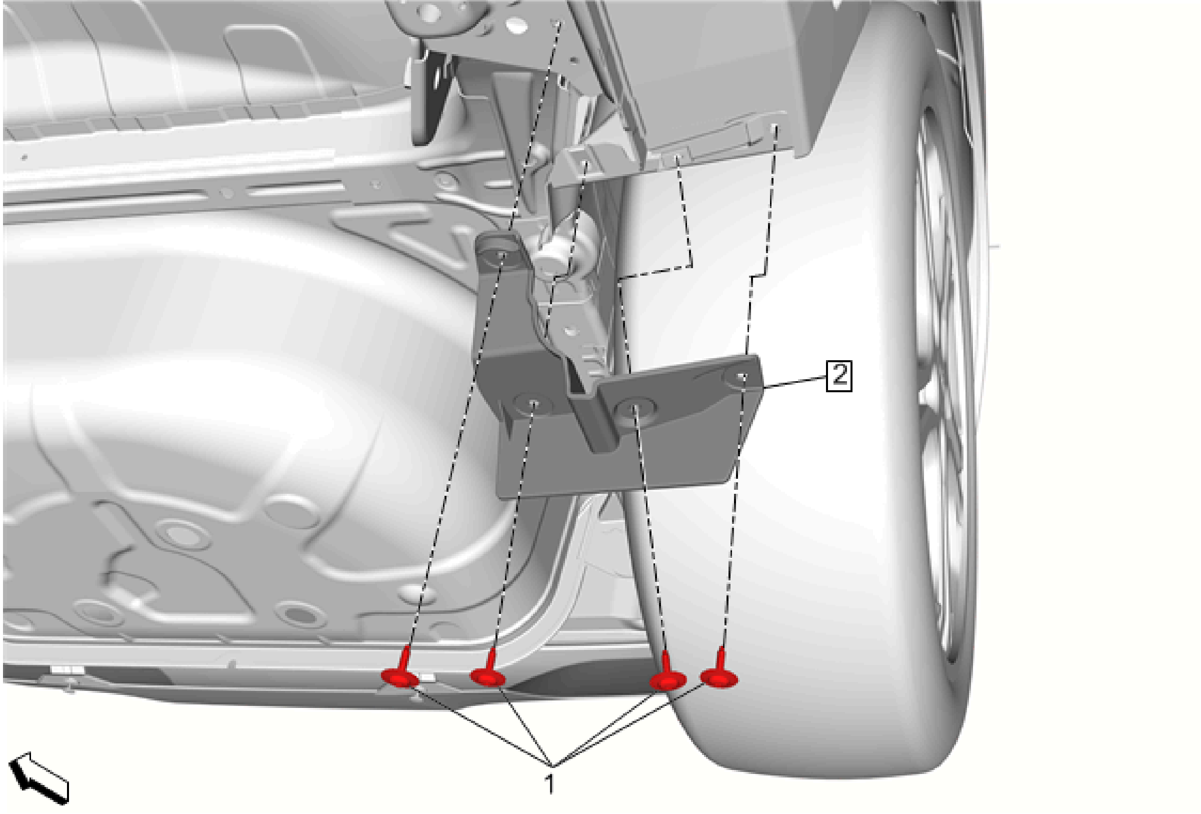

Fig. 90: Rear Tire Front Air Deflector
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Raise and support the vehicle. Lifting and Jacking the Vehicle	
1	Rear Tire Front Air Deflector Fastener (Qty: 4) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Rear Tire Front Air Deflector **Procedure** Lower the vehicle. Lifting and Jacking the Vehicle

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B010E: PEDESTRIAN FRIENDLY ALERT AUDIO OUTPUT CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: Diagnostic System Check - Vehicle
- Review the description of Strategy Based Diagnosis: Strategy Based Diagnosis
- An overview of each diagnostic category can be found here: Diagnostic Procedure Instructions

DTC Descriptor

DTC B010E

Pedestrian Friendly Alert Audio Output Circuit

Symptom Byte Information: Symptom Byte List

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Pedestrian Friendly Alert Speaker Control (-)	1	B010E 04	1	B010E 1B
Pedestrian Friendly Alert Speaker Control (+)	1	B010E 04	1	B010E 1B
1. P48 Pedestrian Alert Sound Speaker = Inoperative				

Circuit/System Description

For an overview of the component/system, refer to: **Pedestrian Alert Description and Operation**

Circuit	Description
Pedestrian Friendly Alert Speaker Control (-)	The output circuit is switched to 6 V to activate the component.
Pedestrian Friendly Alert Speaker Control (+)	The output circuit is switched to 6 V to activate the component.

Component	Description
P48 Pedestrian Alert Sound Speaker	Each of the speaker output [+] and [-] circuits has a DC bias voltage that is approximately one half of the battery voltage. When using a DMM, each of the circuits will measure approximately 6 V DC to ground. The audio being played is produced by a varying AC voltage that is centered around the DC bias voltage. The AC voltage causes the speaker cone to move and produce sound.
K132 Pedestrian Alert Sound Control Module	The control module K132 controls a speaker to emit an audible tone at low vehicle speeds to notify pedestrians of an approaching vehicle.

Conditions for Running the DTC

Ignition - On / Vehicle - In Service Mode & Transmission in Drive

Conditions for Setting the DTC

- B010E 1B - Control Circuit = Signal Cross Coupled
- B010E 04 - Control Circuit = Open/High Resistance

Actions Taken When the DTC Sets

Pedestrian Alert Sound System = Inoperative

Conditions for Clearing the DTC

- A current DTC will clear when the diagnostic runs and passes.
- A history DTC will clear after 50 consecutive malfunction-free ignition cycles.

Schematic Reference

Horn Schematics

Connector End View Reference

COMPONENT CONNECTOR END VIEWS - INDEX

Component View Reference

Front of Vehicle/Engine Compartment Component Views

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode & Transmission in Drive
2. Verify the component is activated: P48 Pedestrian Alert Sound Speaker
    - **If the component does not produce a sound**

      Refer to: Circuit/System Testing

    - **If the component produces a sound**
3. All OK.

Circuit/System Testing

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: P48 Pedestrian Alert Sound Speaker
3. Test for less than 10 Ω between the test points: Low Reference terminal 1 & Ground
    - **If 10 Ω or greater**
    1. Disconnect the electrical connector: K132 Pedestrian Alert Sound Control Module
    2. Test for less than 2 Ω between the test points: Low Reference terminal 1 at Component harness & Terminal 8 at Control module harness
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Replace the component: K132 Pedestrian Alert Sound Control Module
    - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode & Transmission in Drive
5. Test for 5 to 7 V between the test points: Control circuit terminal 2 & Ground
    - **If less than 5 V**
    1. Ignition/Vehicle - Off
    2. Disconnect the electrical connector: K132 Pedestrian Alert Sound Control Module
    3. Test for infinite resistance between the test points: Control circuit terminal 2 at Component harness & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance
    4. Test for less than 2 Ω between the test points: Control circuit terminal 2 at Component harness & Terminal 9 at Control module harness
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Replace the component: K132 Pedestrian Alert Sound Control Module
    - **If greater than 7 V**
    1. Ignition/Vehicle - Off
    2. Disconnect the electrical connector: K132 Pedestrian Alert Sound Control Module
    3. Ignition - On / Vehicle - In Service Mode
    4. Test for less than 1 V between the test points: Control circuit terminal 2 at Component harness & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V - Replace the component: K132 Pedestrian Alert Sound Control Module
    - **If between 5 and 7 V**
6. Test or replace the component: P48 Pedestrian Alert Sound Speaker

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- **Pedestrian Sound Alert Speaker Replacement**
- For control module replacement, programming, and setup refer to: **Control Module References**

DTC B274E OR B274F: LOW HORN OUTPUT SHORT TO BATTERY

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B274E 01

Low Horn Output Short to Battery

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Control	2	1	B274E 01	-
1. Horns Inoperative 2. Horns Always ON				

Circuit/System Description

The body control module controls the horn relay by providing a ground to the control circuit of the horn relay coil energizing the relay. When the horn relay is energized, the horn relay contacts close applying voltage through the horn fuse and the horn control circuit to the horns.

Conditions for Running the DTC

The DTC can only set only when the output is actively being requested by the body control module.

Conditions for Setting the DTC

The body control module detects a short to voltage in the horn relay circuit.

Action Taken When the DTC Sets

The horns will be inoperative.

Conditions for Clearing the DTC

- The DTC clears when the fault is no longer detected.
- The current DTC will become history when the request for the output is removed.
- The history DTC will clear after 50 consecutive fault-free ignition cycles have occurred.

COMPONENT CONNECTOR END VIEWS - INDEX

Description and Operation

Horns System Description and Operation

Electrical Information Reference

- Circuit Testing
- Connector Repairs
- Testing for Intermittent Conditions and Poor Connections
- Wiring Repairs

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the P12 Horn turns ON and OFF when commanding the Horn Relay On and Off with a scan tool.
    - **If the P12 Horn is always ON or always OFF**

      Refer to Circuit/System Testing.
    - **If the P12 Horn turns ON and OFF**
3. All OK.

Circuit/System Testing

1. Vehicle OFF.
2. Disconnect the X5 harness connector at the K9 Body Control Module, Vehicle in Service Mode.
3. Verify the P12 Horn is not activated.
    - **If the P12 Horn is activated**
    1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block-Underhood.
    2. Test for infinite resistance between the K9 Body Control Module control circuit terminal 19 X5 and ground.
        - If less than Infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, test or replace the X50A Fuse Block-Underhood.
    - **If the P12 Horn is not activated**
4. Connect a 3 A fused jumper wire between the control circuit terminal 19 and ground.
5. Verify the P12 Horn activates.
    - **If the P12 Horn does not activate**
    1. Vehicle OFF, remove the jumper wire, disconnect the X2 harness connector at the X50A Fuse Block-Underhood, Vehicle in Service Mode.
    2. Test for less than 1 V between the K9 Body Control Module control circuit terminal 19 X5 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, test or replace the X50A Fuse Block-Underhood.
    - **If the P12 Horn activates**
6. Replace the K9 Body Control Module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

Control Module References for body control module replacement, programming and setup

SYMPTOMS - HORNS

Important Preliminary Checks Before Starting:

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
2. Review the horn operation or pedestrian alert sound system operation in order to familiarize yourself with the system functions. Refer to the following:
    - **Horns System Description and Operation**
    - **Pedestrian Alert Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the rear window defogger. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

NOTE:

- **Inspect for proper installation of electrical components if an intermittent condition exists. Inspect for aftermarket theft deterrent devices, lights, and cellular phones. Ensure that no aftermarket equipment is connected to the class 2 circuit. If you can not locate an intermittent condition, a cellular phone signal may cause the condition. Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to Testing for Intermittent Conditions and Poor Connections .**
- **The problem may or may not turn ON the SERVICE VEHICLE SOON indicator or store a DTC. Do not use the symptom tables to diagnose intermittent conditions. The malfunction must be present in order to locate the problem.**

Poor electrical connections or wiring cause most intermittent conditions. Perform a careful visual/physical check for the following conditions:

- Poor mating of the connector halves or a terminal not fully seated in the connector body
- An improperly formed or damaged terminal
- Reform or replace connector terminals in the problem circuit in order to ensure proper contact tension.
- Poor terminal to wire connection requires removing the terminal from the connector body in order to perform the check.

Use a scan tool in order to help detect intermittent conditions. The scan tool has several features that can be used to locate an intermittent condition. The snapshot feature can capture and store data parameters within the scan tool when the malfunction occurs. This information can then be reviewed in order to see what caused the malfunction.

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Horns Malfunction**
- **Pedestrian Alert System Malfunction**

HORNS MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

3. P12R Horn - Right = Always On
4. P12R Horn - Right = Inoperative
5. S33 Horn Switch = Inoperative

Circuit/System Description

For an overview of the component/system, refer to: **Horns System Description and Operation**

Circuit	Description
B+ - Relay Coil	Supplied from a fuse.
B+ - Relay Switch	Supplied from a fuse.
Signal - S33 Horn Switch	The control module input circuit has an internal resistance connected to 12 V.
Control - P12 Horn	The output circuit is switched to 12 V to activate the component.
Control - Relay Coil	The output circuit is switched to ground to activate the component.
Ground - S33 Horn Switch	Chassis Ground
Ground - P12 Horn	Chassis Ground

Component	Description
P12 Horn	The horn has an electromagnet which pulls a diaphragm inwards and simultaneously opens a contact which interrupts the current through the magnet. When the diaphragm springs back, the contact is closed and the cycle starts over. The vibration of the diaphragm produces the sound.
S33 Horn Switch	The switch has a normally open contact.When the switch is activated, the signal circuit to the control module is grounded.
K9 Body Control Module	The module controls various vehicle functions like lighting, central door locking, power windows, etc.
X50A Fuse Block - Underhood	The fuse block houses various fuses and relays.

Diagnostic Aids

Rotate the steering wheel while pressing the horn pad to identify intermittent and poor connections within the steering column.

If the horn produces only a weak noise, inspect the following:

- Debris or water in the horn.
- Incorrect MountingRefer to: **Fastener Specifications**.
- Debris on the component.
- Vehicle components that vibrate while the horn is sounding.

Scan Tool Reference

Control Module References

Circuit/System Verification

1. Verify the scan tool parameter: Horn Switch = Inactive
    - **If not the specified state**

      Refer to: Circuit/System Testing - Test 1

    - **If the specified state**
2. Operate the component: S33 Horn Switch - Pressed

   Verify the scan tool parameter: Horn Switch = Active

    - **If not the specified state**

      Refer to: Circuit/System Testing - Test 1

    - **If the specified state**
3. Perform the scan tool control function: Horn Relay Command - On and Off

   Verify the component turns On and Off: P12L Horn - Left & P12R Horn - Right & The horn should emit a clear and even tone.

    - **If none of the components operate**

      Refer to: Circuit/System Testing - Test 2

    - **P12 Horn - InoperativeorIf an abnormal noise is present**

  - Refer to: Circuit/System Testing - Test 3
  - **If the component turns On and Off & If no abnormal noise is present**
4. All OK.

Circuit/System Testing

Test 1

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle Off and all vehicle systems Off.
2. Disconnect the electrical connector: S33 Horn Switch
3. Test for less than 10 Ω between the test points: Ground circuit terminal 2 & Ground
   - **If 10 Ω or greater**
   1. Disconnect the ground connection: G200
   2. Test for less than 2 Ω between the test points: Ground circuit terminal 2 at Component harness & Terminal G200
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
4. Ignition On/Vehicle in Service Mode.
5. Verify the scan tool parameter: Horn Switch = Inactive
   - **If not the specified state**
   1. Ignition/Vehicle Off.
   2. Disconnect the electrical connector: X3 at K9 Body Control Module
   3. Test for infinite resistance between the test points: Signal circuit terminal 1 at Component harness & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance - Replace the component: K9 Body Control Module
   - **If the specified state**
6. Connect a 3 A fused jumper wire between the test points: Signal circuit terminal 1 & Ground circuit terminal 2
7. Verify the scan tool parameter: Horn Switch = Active
   - **If not the specified state**
   1. Ignition/Vehicle Off.Remove - Jumper Wire
   2. Disconnect the electrical connector: X3 at K9 Body Control Module
   3. Ignition On/Vehicle in Service Mode.
   4. Test for less than 1 V between the test points: Signal circuit terminal 1 at Component harness & Ground
      - If 1 V or greater - Repair the short to voltage on the circuit.
      - If less than 1 V
   5. Ignition/Vehicle Off.
   6. Test for less than 2 Ω between the test points: Signal circuit terminal 1 at Component harness & Terminal 18 X3 at Control module harness
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Replace the component: K9 Body Control Module
   - **If the specified state**
8. Test or replace the component: S33 Horn Switch

Test 2

1. Ignition/Vehicle Off.
2. Disconnect the electrical connector: X1X50A Fuse Block - Underhood
3. Ignition - On / Vehicle - In Service Mode
4. Momentarily connect a 20 A fused jumper wire between the test points:
    - Control circuit terminal 10 X1 & B+
    - Control circuit terminal 11 X1 & B+
5. Verify the component turns On and Off when connecting and disconnecting the jumper wire: P12L Horn - Left & P12R Horn - Right
    - **If the component does not turn On and Off**
    1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
    2. Disconnect the electrical connector: P12L Horn - Left & P12R Horn - Right
    3. Ignition - On / Vehicle - In Service Mode
    4. Test for less than 1 V between the test points:
        - Control circuit terminal 10 X1 at Component harness & Ground
        - Control circuit terminal 11 X1 at Component harness & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V
    5. Ignition/Vehicle - Off
    6. Test for infinite resistance between the test points:
        - Control circuit terminal 10 X1 at Component harness & Ground
        - Control circuit terminal 11 X1 at Component harness & Ground
        - If less than infinite resistance - Repair the short to ground on the circuit.
        - If infinite resistance
    7. Test for less than 2 Ω between the test points:
        - Control circuit terminal 2 at Component harness & Control circuit terminal 10 X1 at Fuse Block Harness
        - Control circuit terminal 2 at Component harness & Control circuit terminal 11 X1 at Fuse Block Harness
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Test or replace the component: P12L Horn - Left & P12R Horn - Right
    - **If the component turns On and Off**
6. Connect the electrical connector: X1 at X50A Fuse Block - Underhood
7. Disconnect the electrical connector: X5 at K9 Body Control Module
8. Ignition - On / Vehicle - In Service Mode
9. Momentarily connect a 3 A fused jumper wire between the test points: Control circuit terminal 19 X5 & B+

    Verify the component turns On and Off when connecting and disconnecting the jumper wire: P12L Horn - Left & P12R Horn - Right

    - **If the component does not turn On and Off**
    1. Ignition/Vehicle - Off & Remove - Jumper wire(s)
    2. Disconnect the electrical connector: X2 at X50A Fuse Block - Underhood
    3. Ignition - On / Vehicle - In Service Mode
    4. Test for less than 1 V between the test points: Control circuit terminal 19 X5 at Control module harness & Ground
        - If 1 V or greater - Repair the short to voltage on the circuit.
        - If less than 1 V
    5. Ignition/Vehicle - Off

6. Test for infinite resistance between the test points: Control circuit terminal 19 X5 at Control module harness & Ground
    - If less than infinite resistance - Repair the short to ground on the circuit.
    - If infinite resistance
7. Test for less than 2 Ω between the test points: Control circuit terminal 19 X5 at Control module harness & Terminal 24 X2 at Fuse Block Harness
    - If 2 Ω or greater - Repair the open/high resistance in the circuit.
    - If less than 2 Ω - Test or replace the component: X50A Fuse Block - Underhood
- **If the component turns On and Off**

10. Replace the component: K9 Body Control Module

Test 3

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the appropriate electrical connector: P12L Horn - LeftorP12R Horn - Right
3. Test for less than 1 Ω between the test points: Ground circuit terminal 1 & Ground
    - **If 1 Ω or greater**
    1. Disconnect the ground connection: G100/G101
    2. Test for less than 1 Ω between the test points:
        - Ground circuit terminal 1 & Terminal G100
        - Ground circuit terminal 1 & Terminal G101
        - If 1 Ω or greater - Repair the open/high resistance in the circuit.
    - **If less than 1 Ω**
4. Disconnect the electrical connector: X1 at X50A Fuse Block - Underhood
5. Test for less than 1 Ω between the test points:
    - Control circuit terminal 2 at Component harness & Control circuit terminal 10 X1 at Fuse Block Harness
    - Control circuit terminal 2 at Component harness & Control circuit terminal 11 X1 at Fuse Block Harness
    - If 1 Ω or greater - Repair the open/high resistance in the circuit.
    - **If less than 1 Ω**
6. Test or replace the component: P12 Horn

Component Testing

P12 Horn

1. Ignition/Vehicle - Off
2. Disconnect the appropriate electrical connector: P12L Horn - LeftorP12R Horn - Right
3. Connect a jumper wire between the test points: Ground terminal 1 & Ground
4. Momentarily connect a 15 A fused jumper wire between the test points: Control terminal 2 & 12 V

    Verify the component turns On and Off when connecting and disconnecting the jumper wire: P12 Horn

    - **If the component does not turn On and Off**

      Replace the component: P12 Horn

    - **If the component turns On and Off**

5. All OK.

S33 Horn Switch

1. Ignition/Vehicle - Off
2. Disconnect the electrical connector: at S33 Horn Switch
3. Test for infinite resistance between the test points: Signal circuit terminal 1 & Ground circuit terminal 2 - Switch Not Pressed
    - **If less than infinite resistance**

      Replace the component: S33 Horn Switch

    - **If infinite resistance**
4. Test for less than 3 Ω between the test points: Signal circuit terminal 1 & Ground circuit terminal 2 - Switch - Pressed
    - **If 3 Ω or greater**

      Replace the component: S33 Horn Switch

    - **If less than 3 Ω**
5. All OK.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- **Horn Replacement (High Note)Horn Replacement (Low Note)**
- **Steering Wheel Airbag Replacement**
- **Engine Wiring Harness Junction Block Replacement**
- For control module replacement, programming, and setup refer to: **Control Module References**

PEDESTRIAN ALERT SYSTEM MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check prior to using this diagnostic procedure: **Diagnostic System Check - Vehicle**
- Review the description of Strategy Based Diagnosis: **Strategy Based Diagnosis**
- An overview of each diagnostic category can be found here: **Diagnostic Procedure Instructions**

Circuit/System Description

For an overview of the component/system, refer to: **Pedestrian Alert Description and Operation**

Circuit	Description
B+ - K132 Pedestrian Alert Sound Control Module	Supplied from a fuse.
Ground - K132 Pedestrian Alert Sound Control Module	Chassis Ground
Pedestrian Friendly Alert Speaker Control (-)	The output circuit is switched to 6 V to activate the component.
Pedestrian Friendly Alert Speaker Control (+)	The output circuit is switched to 6 V to activate the component.

Component	Description
P48 Pedestrian Alert Sound Speaker	Each of the speaker output [+] and [-] circuits has a DC bias voltage that is approximately one half of the battery voltage. When using a DMM, each of the circuits will measure approximately 6 V DC to ground. The audio being played is produced by a varying AC voltage that is centered around the DC bias voltage. The AC voltage causes the speaker cone to move and produce sound.
K132 Pedestrian Alert Sound Control Module	The control module K132 controls a speaker to emit an audible tone at low vehicle speeds to notify pedestrians of an approaching vehicle.

Circuit/System Verification

1. Ignition - On / Vehicle - In Service Mode & Transmission in Drive
2. Verify the component is activated: P48 Pedestrian Alert Sound Speaker
    - **If the component does not produce a sound**

      Refer to: Circuit/System Testing

    - **If the component produces a sound**
3. All OK.

Circuit/System Testing

NOTE: **It may take up to 2 min for all vehicle systems to power down before an accurate ground or low reference circuit continuity test can be performed.**

1. Ignition/Vehicle & All vehicle systems - Off
2. Disconnect the electrical connector: K132 Pedestrian Alert Sound Control Module
3. Test for less than 10 Ω between the test points: Ground circuit terminal 3 & Ground
    - **If 10 Ω or greater**
    1. Disconnect the ground connection: G302
    2. Test for less than 2 Ω between the test points: Ground circuit terminal 3 & Terminal G302
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
4. Ignition - On / Vehicle - In Service Mode
5. Verify a test lamp turns On between the test points: B+ circuit terminal 10 & Ground
    - **If the test lamp does not turn On and the circuit fuse is OK**
    1. Ignition/Vehicle - Off & Remove - Test lamp
    2. Test for less than 2 Ω between the test points: B+ circuit terminal 10 & Output terminal at F9UA Fuse
        - If 2 Ω or greater - Repair the open/high resistance in the circuit.
        - If less than 2 Ω - Verify the fuse is OK and there is voltage at the fuse.

   - **If the test lamp does not turn On and the circuit fuse is open**
   1. Ignition/Vehicle - Off & Remove - Test lamp
   2. Test for infinite resistance between the test points: B+ circuit terminal 10 & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance - Replace the component: K132 Pedestrian Alert Sound Control Module
   - **If the test lamp turns On**

6. Ignition/Vehicle - Off
7. Connect the electrical connector: K132 Pedestrian Alert Sound Control Module
8. Disconnect the electrical connector: P48 Pedestrian Alert Sound Speaker
9. Test for less than 10 Ω between the test points: Low Reference terminal 2 & Ground
   - **If 10 Ω or greater**
   1. Disconnect the electrical connector: K132 Pedestrian Alert Sound Control Module
   2. Test for less than 2 Ω between the test points: Low Reference terminal 2 at Component harness & Terminal 8 at Control module harness
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Replace the component: K132 Pedestrian Alert Sound Control Module
   - **If less than 10 Ω**
10. Ignition - On / Vehicle - In Service Mode & Transmission in Drive
11. Test for 5 to 7 V between the test points: Control circuit terminal 1 & Ground
   - **If less than 5 V**
   1. Ignition/Vehicle - Off
   2. Disconnect the electrical connector: K132 Pedestrian Alert Sound Control Module
   3. Test for infinite resistance between the test points: Control circuit terminal 1 at Component harness & Ground
      - If less than infinite resistance - Repair the short to ground on the circuit.
      - If infinite resistance
   4. Test for less than 2 Ω between the test points: Control circuit terminal 1 at Component harness & Terminal 9 at Control module harness
      - If 2 Ω or greater - Repair the open/high resistance in the circuit.
      - If less than 2 Ω - Replace the component: K132 Pedestrian Alert Sound Control Module
   - **If greater than 7 V**
   1. Ignition/Vehicle - Off
   2. Disconnect the electrical connector: K132 Pedestrian Alert Sound Control Module
   3. Ignition - On / Vehicle - In Service Mode
   4. Test for less than 1 V between the test points: Control circuit terminal 1 at Component harness & Ground
      - If 1 V or greater - Repair the short to voltage on the circuit.
      - If less than 1 V - Replace the component: K132 Pedestrian Alert Sound Control Module
   - **If between 5 and 7 V**
12. Test or replace the component: P48 Pedestrian Alert Sound Speaker

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair: **Diagnostic Repair Verification**

- **Pedestrian Sound Alert Speaker Replacement**
- For control module replacement, programming, and setup refer to: **Control Module References**

REPAIR INSTRUCTIONS

HORN REPLACEMENT (HIGH NOTE)

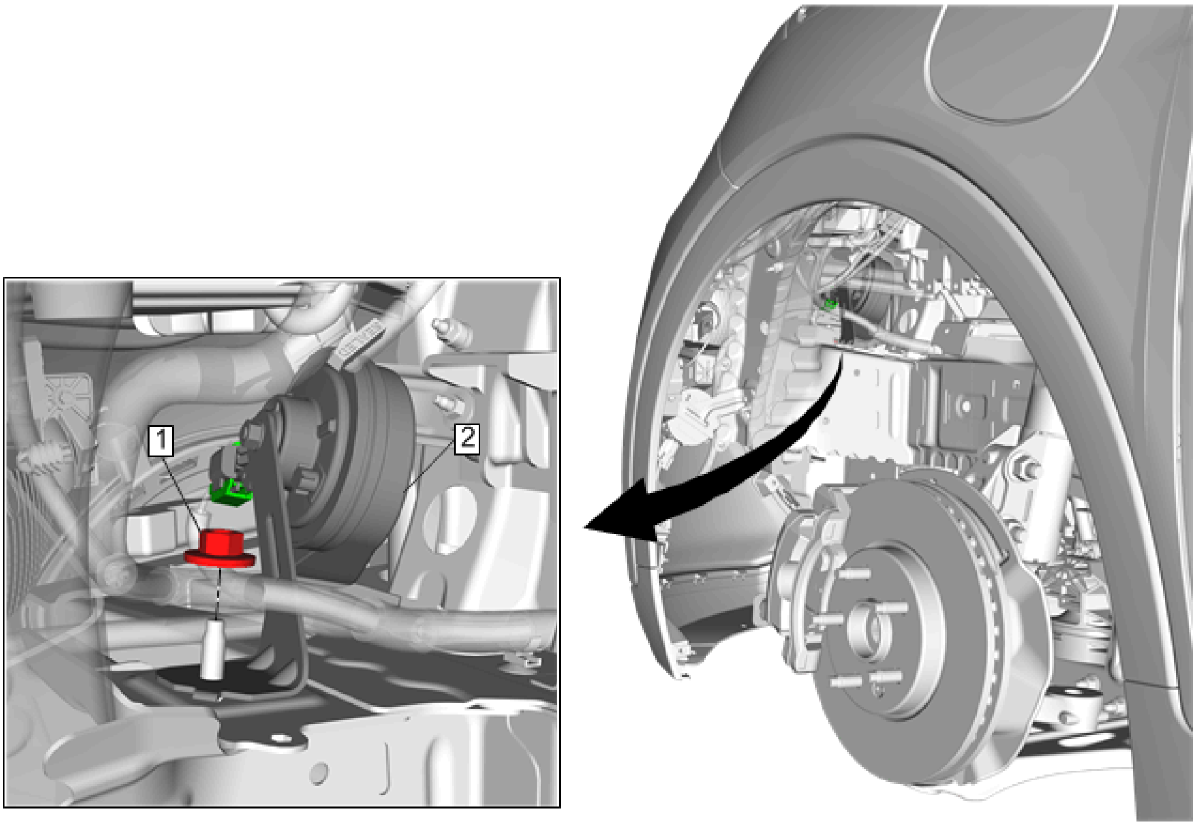

Fig. 3: Horn (High Note)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Front Wheelhouse Liner-Left Side - Remove - Front Wheelhouse Liner Replacement	
1	Horn Nut **CAUTION:** Fastener Caution **Tighten** 22 N.m (16 lb ft)
2	Horn - High Note **Procedure** Disconnect the electrical connector.

HORN REPLACEMENT (LOW NOTE)

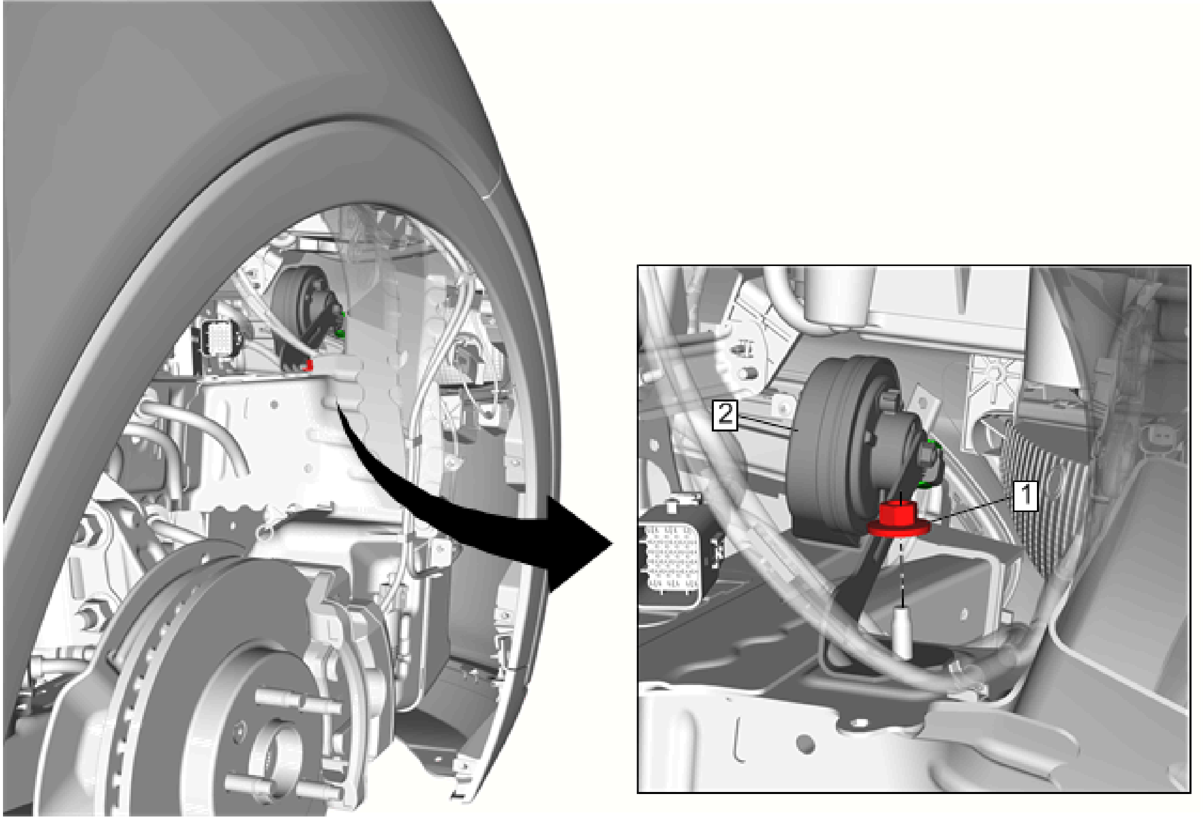

Fig. 4: Horn (Low Note)
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Front Wheelhouse Liner-Right Side - Remove - **Front Wheelhouse Liner Replacement**	
1	Horn Nut **CAUTION:** **Fastener Caution** **Tighten** 22 N.m (16 lb ft)
2	Horn - Low Note **Procedure** Disconnect the electrical connector.

PEDESTRIAN SOUND ALERT MODULE REPLACEMENT

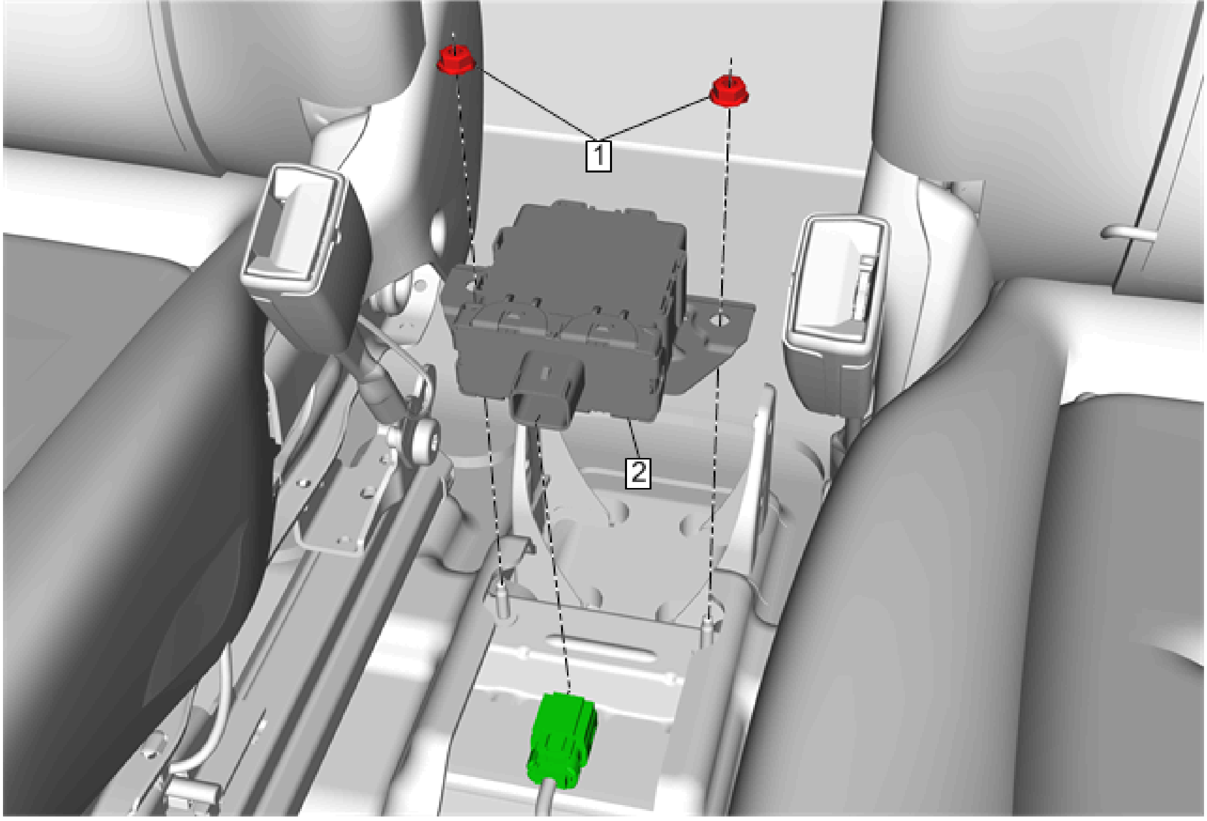

Fig. 5: Pedestrian Sound Alert Module
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Floor Console Replacement	
1	Pedestrian Sound Alert Module Bracket Nut (Qty: 2) **CAUTION:** Fastener Caution **Tighten** 9 N.m (80 lb in)
2	Pedestrian Sound Alert Module **Procedure** 1. Disconnect the electrical connector. 2. Perform all necessary programming and setup procedures for the control module: Control Module References

PEDESTRIAN SOUND ALERT SPEAKER REPLACEMENT

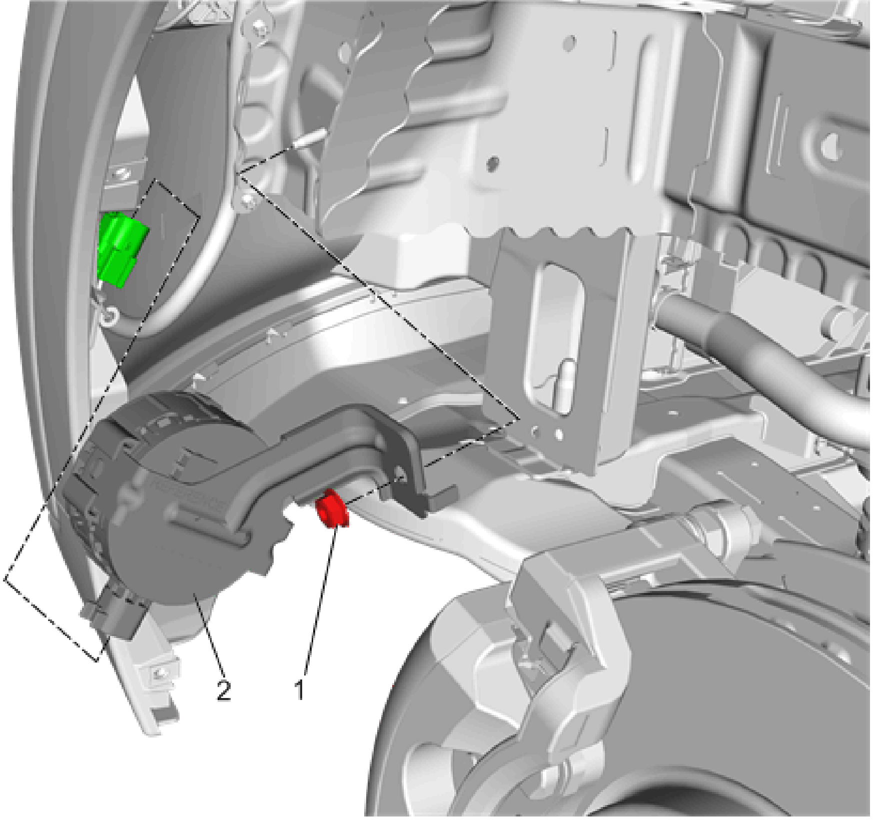

Fig. 6: Pedestrian Sound Alert Speaker
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Front Wheelhouse Liner Replacement	
1	Pedestrian Sound Alert Speaker Bracket nut **CAUTION:** Fastener Caution **Tighten** 9 N.m (80 lb in)
2	Pedestrian Sound Alert Speaker **Procedure** Disconnect the electrical connector.

DESCRIPTION AND OPERATION

HORNS SYSTEM DESCRIPTION AND OPERATION

System Description

The horn system consists of the following components:

- HORN fuse
- Underhood fuse block (contains PCB horn relay)
- Horn switch
- Horn-low note
- Horn-high note
- Body control module (BCM)

K9	K9 Body Control Module
X50A	X50A Fuse Block - Underhood
P12A	P12A Horn - High Note
P12B	P12B Horn - Low Note

System Operation

The vehicle horn system is activated under the following conditions:

- When the horn switch is depressed
- The BCM commands the horns ON under any of the following conditions:
  - When the content theft deterrent system detects a vehicle intrusion - For further information refer to **Theft Systems Description and Operation** .
  - When the panic button is depressed on the remote control door lock transmitter - For further information refer to **Keyless Entry System Description and Operation** .
  - When the keyless entry system is used to lock the vehicle, a horn chirp may sound to notify the driver that the vehicle has been locked. The notification feature may be enabled or disabled through personalization. For further information refer to **Keyless Entry System Description and Operation** .
  - When the OnStarÃ‚Â® system is used to sound the horns if equipped - For further information, refer to **OnStar Description and Operation (UE3)** **OnStar Description and**

Operation (UE1) .

Circuit Operation

Battery positive voltage is applied at all times to the horn relay coil and the horn relay switch. Pressing either of the horn switches applies ground to the horn relay control circuit. The BCM may also apply ground to the horn relay control circuit as described above. When the horn relay control circuit is grounded, the horn relay is energized and battery positive voltage is applied to the horns through the horn control circuit. The horns sound as long as ground is applied to the horn relay control circuit.

PEDESTRIAN ALERT DESCRIPTION AND OPERATION

Electric vehicles present a situation for visually impaired pedestrians who cannot hear an approaching electric vehicle, the pedestrian alert module creates sounds from a dedicated speaker to alert a visually impaired pedestrian, in a non-startling manner.

Operation of the Pedestrian Alert

- Emit sound from 0 to 12 MPH (20 KM/H)
- Fade in and out control for the sound ON and OFF
- Change the pitch of the sound dependent of vehicle speed

DIAGNOSTIC INFORMATION AND PROCEDURES

DTC B2955: SECURITY SENSOR DATA CIRCUIT MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B2955 00

Security Sensor Data Circuit Malfunction

For symptom byte information, refer to Symptom Byte List .

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
B+	B2955 00	B2955 00	-	-
Serial Data	B2955 00	B2955 00	B2955 00	B2955 00
Low Reference	-	B2955 00	-	-

Circuit/System Description

When a keyless entry transmitter is inserted into the transmitter pocket/slot and the ignition mode switch is pressed, the transponder embedded in the transmitter is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

Vehicle is ON or in Service Mode.

Conditions for Setting the DTC

The BCM detects a circuit fault on the immobilizer antenna circuits.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. A service message will be displayed in the driver information center.

Conditions for Clearing the DTC

- A current DTC will be cleared when the condition for setting the DTC are no longer present.
- A history DTC will be cleared after 100 malfunction-free power mode cycles.

Control Module References for scan tool information

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the K89 Immobilizer Control Module. It may take up to 2 min for all vehicle systems to power down.

2. Verify a test lamp illuminates between the low reference circuit terminal 1 and B+.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
3. Vehicle in Service Mode.

NOTE: **In some instances, the K9 Body Control Module may only apply voltage for 3 s immediately after the ignition mode switch is pressed. It may be necessary to monitor the DMM while pressing the ignition mode switch to observe the voltage.**

4. Test for greater than 9 V between the ignition circuit terminal 3 and ground.
    - **If 9 V or less**
    1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the ignition circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If greater than 9 V**
5. Vehicle in Service Mode.
6. Test for 12 - 13 V between the serial data circuit terminal 2 and ground.
    - **If less than 12 V**
    1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the serial data circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the serial data circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If greater than 13 V**
    1. Vehicle OFF, disconnect the harness connector at the K9 Body Control Module, vehicle ON.
    2. Test for less than 1 V between the signal circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If within 12 - 13 V**
7. Replace the K89 Immobilizer Control Module.
8. Verify DTC B2955 is not set.
    - **If DTC B2955 is set**

      Replace the K9 Body Control Module.

    - **If DTC B2955 is not set or is set as history**
9. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for body control module or immobilizer control module replacement, programming, and setup

DTC B302A: MOBILE TELEPHONE COMMUNICATIONS INTERFACE REQUESTED IMMOBILIZATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B302A

Mobile Telephone Communications Interface Requested Immobilization

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

As part of the vehicle telematics enhanced services, a request may be sent to the body control module (BCM) to disable vehicle starting. If a valid message is received by the BCM requesting that starting be disabled, the start enable message will not be sent to the engine control module (ECM).

Conditions for Running the DTC

The BCM continuously monitors for this DTC.

Conditions for Setting the DTC

A start disable message has been received from the telematics module.

Action Taken When the DTC Sets

Vehicle starting will be suspended and the security indicator will be illuminated.

Conditions for Clearing the DTC

- A current DTC will clear when the telematics start disable request is no longer received.
- A history DTC will clear after 100 ignition cycles in which the telematic start disable request is not seen.

Diagnostic Aids

- DTC B302A is only an indicator that a start disable request has been received from the vehicle telematics system and does not indicate a fault in the immobilizer or telematics system.
- To remove the start disable request, the vehicle account must be updated with the OnStar stolen vehicle team. This will require that a law enforcement agency or the customer contact OnStar to indicate that the vehicle has been successfully and safely recovered.
- If the OnStar system has been disabled or damage during a theft attempt, the system will not be able to communicate and the start disable request will not be removed. OnStar must be functioning properly for the start disable request to be removed.

Description and Operation

Immobilizer Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify the OnStar system is not damaged and is operating properly, with no DTCs set.
    - **If the OnStar system is damaged, inoperative, or any OnStar DTCs are set**

      These concerns must be corrected before the start disable can be removed.

    - **If the OnStar system is not damaged and is operating properly**
2. Press the blue OnStar button and ask the advisor to be transferred to the stolen vehicle team to verify the vehicle account has been updated.
3. Verify that OnStar is aware the vehicle has been recovered and that the vehicle account has been updated.
    - **If OnStar has not been notified that the vehicle has been recovered**

      Contact the customer and advise them that for security purposes, they must contact OnStar and the law enforcement agency to update the vehicle account.

    - **If the account has been properly updated**
4. Once the vehicle account has been updated and the start disable request has been removed, DTC B302A will transition to a history DTC. Clear the history DTC.

DTC B3031: SECURITY CONTROLLER IN LEARN MODE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3031

Security Controller In Learn Mode

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When learning a coded key, the body control module (BCM) is placed in learn mode. DTC B3031 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. On some model year vehicles the instructions for adding keys includes the direction to always use two learned keys. This DTC will set if that direction is not followed. If only one learned key is available then Replacing Keys must be performed. Once the coded key is learned, learn mode will be exited and the DTC cleared. If the BCM does not exit learn mode, DTC B3031 will remain current and indicate a fault.

The instrument cluster security indicator will illuminate and the driver information center will display a message.

Conditions for Running the DTC

The immobilizer system is the learn coded keys state.

Conditions for Setting the DTC

The DTC will set any time the BCM enters the learn coded keys state.

Action Taken When the DTC Sets

The security indicator will illuminate. The driver information center will display a message.

Conditions for Clearing the DTC

- A current DTC B3031 will be cleared upon the successful exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Description and Operation

Immobilizer Description and Operation

Electrical Information Reference

- **Circuit Testing**
- **Connector Repairs**
- **Testing for Intermittent Conditions and Poor Connections**
- **Wiring Repairs**

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Verify all available keys are correct for the vehicle. This can be accomplished by comparing the part number that is laser etched on the key to the part number listed in the parts catalog.

   NOTE: **On some model year vehicles two learned keys are required to add additional keys. If only one learned key is used, this DTC will set. If only one learned key is available then Replacing Keys must be performed.**

   - **If a key is not correct**

     Replace the key

   - **If all keys are correct**
2. Verify the scan tool Immobilizer data displays two or more keys learned to the vehicle.
   - **If not**

Add one additional key

- **If two or more keys are learned to the vehicle**

3. Perform the Replacing Keys procedure. Refer to **Key with Integrated Transmitter Programming**.
4. Verify the K9 Body Control Module learns the vehicle key and exits the learn coded key state. The scan tool Master Keys Learned parameter should increment to 1.
    - **If the K9 Body Control Module does not exit the learn coded key state after the programming attempt**

      Replace the K9 Body Control Module

    - **If the K9 Body Control Module exits the learn coded key state after the programming attempt**
5. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for body control module replacement, programming, and setup.

DTC B3055: NO TRANSPONDER MODULATION OR NO TRANSPONDER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3055

No Transponder Modulation or No Transponder

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When a vehicle key is inserted into the key slot and the vehicle on/off switch is pressed, the transponder embedded in the head of the key is energized by the exciter coils. The energized transponder transmits a signal that contains its unique value, which is received by the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is not correct, the BCM disables engine start.

Conditions for Running the DTC

Vehicle is ON or in Service Mode.

Conditions for Setting the DTC

The BCM is unable to measure the key transponder value.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will illuminate. A service message will be displayed in the driver information center.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a valid transponder value from the key.

- A history DTC will be cleared after 100 malfunction-free power mode cycles.

Diagnostic Aids

- Because DTC B3055 may be caused by a malfunctioning vehicle key, it is necessary to have all available keys at the time of diagnosis. A possible scenario would be a customer leaving the vehicle with a spare key during the service visit, but the key which they use everyday, not the spare key, is the cause of the DTC. Not having all available keys in this instance would result in the customer concern not being duplicate or a misdiagnosis.
- Ensure that the immobilizer control module is properly installed and fully seated. An audible and/or tactile click will indicate that the immobilizer control module is fully seated. To ensure proper transponder communication, the key must be in a specific location in relation to the immobilizer control module. If the immobilizer control module is not fully seated, transponder communication may not occur and DTC B3055 will set.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify that DTC B1370, B1380, or B1441 is not set.
    - **If any of the DTCs are set**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If none of the DTCs are set**
3. Verify all available keys are correct for the vehicle.
    - **If a key is not correct**

      Replace the key

    - **If all keys are correct**
4. Remove the battery from each of the available vehicle keys.
5. Verify that DTC B3055 does not set while attempting to start the vehicle which each available key. To start the vehicle with the key battery removed, the key must be placed in the key slot.
    - **If DTC B3055 sets when attempting to start the vehicle with only one of the available keys**

Replace the appropriate key.

- **If DTC B3055 sets when attempting to start the vehicle with all of the available keys**

  Replace the K89 Immobilizer Control Module.

- **If DTC B3055 does not set**

6. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for immobilizer control module replacement, programming, and setup

DTC B305C: IMMOBILIZER TRANSPONDER OF WRONG TYPE PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B305C

Immobilizer Transponder of Wrong Type Programmed

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When a vehicle key/keyless entry transmitter is inserted into the key slot/transmitter pocket and the vehicle on/off switch is pressed, the transponder embedded in the key/transmitter is energized by the immobilizer antenna exciter coil. The transponder transmits a signal to the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is correct, the BCM will send the prerelease password via the serial data circuit to the engine control module (ECM). If the learned key code does not match or a transponder value is not received, the BCM will send the start disable password to the ECM.

Conditions for Running the DTC

- Battery voltage is greater than 9 volts
- Transponder authentication has occurred

Conditions for Setting the DTC

- The programed transponder type does not match the equipped system on the vehicle.
- A transponder used for vehicles without BTM and/or ATH/ATS has been programmed to a vehicle with BTM and/or ATH/ATS.
- A transponder used for vehicles with BTM and/or ATH/ATS has been programmed to a vehicle without BTM and/or ATH/ATS.

Action Taken When the DTC Sets

No action is taken.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a programed transponder type that matches the equipped system on the vehicle.
- A history DTC will be cleared after 100 malfunction-free power mode cycles.

Circuit/System Verification

1. Using each vehicle key, attempt to put the vehicle in Service Mode.
2. Verify DTC B305C does not set after each attempt to put the vehicle in Service Mode.
    - **If the DTC sets**

      Replace the appropriate key or keyless entry transmitter.

    - **If the DTC does not set**
3. All OK.

DTC B3060: UNPROGRAMMED TRANSPONDER IDENTIFICATION CODE RECEIVED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3060

Unprogrammed Transponder Identification Code Received

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When a vehicle key is inserted into the key slot and the vehicle on/off switch is pressed, the transponder embedded in the head of the key is energized by the exciter coils. The energized transponder transmits a signal that contains its unique value, which is received by the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is not correct, the BCM disables engine start.

Conditions for Running the DTC

Vehicle is ON or in Service Mode.

Conditions for Setting the DTC

The transponder value measured by the BCM is incorrect or not learned to the vehicle.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. The driver information center will display a service message.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a valid transponder value from the key.
- A history DTC will be cleared after 100 malfunction-free power mode cycles or when a scan tool is used to clear DTCs.

DTC B389A: ENVIRONMENT IDENTIFICATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B389A

Environment Identification

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When certain modules are programmed and configured during installation, the module learns a specific environment identifier which is unique to the vehicle. The environment identifier is used to prevent the swapping modules between vehicles. The body control module (BCM) is the keeper of the environment identifier. The Instrument Cluster, Electronic Brake Control Module, HVAC Control Module, Inflatable Restraint Sensing and Diagnostic Module, engine control module (ECM), and Steering Column Lock Module (if equipped) each learn the environment identifier during their configuration process. During vehicle operation, the BCM sends the immobilizer identifier as a challenge and each module responds to the challenge by sending the environment identifier back to the BCM. If the BCM sends an incorrect immobilizer identifier or a specific number of incorrect environment identifiers are received, vehicle starting is disabled.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

An incorrect immobilizer identifier was broadcast by the BCM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

A current DTC will be cleared when the BCM broadcasts a correct immobilizer identifier.

Diagnostic Aids

If BCM programming is not completed after BCM replacement, the immobilizer identifier will not be learned. If DTC B389A sets immediately after the replacement and programming of a BCM, perform the programming procedure again.

Circuit/System Verification

1. Verify DTC B389A did not set immediately following the replacement and programming of the K9 Body Control Module.
   - **If the DTC set immediately after the replacement and programming of the K9 Body Control Module**

     The immobilizer learn procedure was not properly completed. Perform the BCM immobilizer learn using the body control module IMMO Function with Existing Transponder or Remote Key in SPS. Refer to Immobilizer System Component Programming.

   - **If the DTC did not set immediately after the replacement and programming of the K9 Body Control Module**
2. Verify DTC B3902 is not set in any of the control modules listed below:
   - K20 Engine Control Module
   - K36 Inflatable Restraint Sensing and Diagnostic Module
   - K17 Electronic Brake Control Module
   - K33 HVAC Control Module
   - P16 Instrument Cluster
   - K60 Steering Column Lock Module (if equipped)
   - **If DTC B3902 is set in any of the modules**

     Refer to DTC B3902.

   - **If DTC B3902 is not set in any of the modules**
3. Perform the K9 Body Control Module immobilizer learn using body control module IMMO Function with Existing Transponder or Remote Key in SPS. Refer to Immobilizer System Component Programming.
4. Verify DTC B389A does not set after programming.
   - **If the DTC sets after programming**

     Replace the K9 Body Control Module.

   - **If the DTC does not set after programming**
5. All OK.

DTC B3902: INCORRECT IMMOBILIZER IDENTIFIER RECEIVED

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC B3902

Incorrect Immobilizer Identifier Received

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When certain modules are programmed and configured during installation, the module learns a specific environment identifier which is unique to the vehicle. The environment identifier is used to prevent the swapping modules between vehicles. The body control module (BCM) is the keeper of the environment identifier. The instrument cluster, electronic brake control module, HVAC control module, inflatable restraint sensing and diagnostic module, engine control module (ECM), and steering column lock module (if equipped) each learn the environment identifier during their configuration process. During vehicle operation, the BCM sends the immobilizer identifier as a challenge and each module responds to the challenge by sending the environment identifier back to the BCM. If the BCM sends an incorrect immobilizer identifier or a specific number of incorrect environment identifiers are received, vehicle starting is disabled.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

The control module's environment identifier does not match the environment identifier stored by the BCM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

A current DTC will be cleared when the module learns a correct environment identifier.

DTC B3935: TRANSPONDER AUTHENTICATION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3935

Transponder Authentication

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When a vehicle key is inserted into the key slot and the vehicle on/off switch is pressed, the transponder embedded in the head of the key is energized by the exciter coils surrounding the key slot. The energized transponder transmits a signal that contains its unique value, which is received by the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is not correct, the BCM disables engine start.

Conditions for Running the DTC

- Vehicle is ON or in Service Mode.
- A valid transponder value has been read.

Conditions for Setting the DTC

- The transponder value is valid and matches the value stored in the BCM memory.
- The transponder calculation of the challenge from the BCM does not match the BCM calculation.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator will illuminate. The driver information center will display a service message.

Conditions for Clearing the DTC

- A current DTC will be cleared when a valid transponder value has been read and authenticated.
- A history DTC will be cleared after 100 malfunction-free power mode cycles.

2. Verify DTC B3935 is not set as current.
    - **If the DTC is set as current**

      Replace the K9 Body Control Module.

    - **If the DTC is set as history**
3. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for body control module replacement, programming, and setup

DTC B3976: UNCONFIGURED TRANSPONDER

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3976

Unconfigured Transponder

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When a vehicle key is inserted into the key slot and the vehicle on/off switch is pressed, the transponder embedded in the head of the key is energized by the exciter coils surrounding the key slot. The energized transponder transmits a signal that contains its unique value, which is received by the body control module (BCM). The BCM then compares this value to a value stored in memory. If the value is not correct, the BCM disables engine start.

Conditions for Running the DTC

- Vehicle is ON or in Service Mode.
- The BCM is in the learn coded key state.

Conditions for Setting the DTC

The BCM has determined the current key is not configured as a proper vehicle key.

Action Taken When the DTC Sets

- Vehicle starting will be disabled.
- The security indicator in the instrument cluster will be illuminated. A service message will be displayed in the driver information center.

Conditions for Clearing the DTC

- A current DTC will be cleared when the BCM detects a properly configured vehicle key.
- A history DTC will be cleared after 100 malfunction-free power mode cycles or when a scan tool is used to clear DTCs.

Circuit/System Verification

1. Verify the engine starts with each available key.
    - **If the engine does not start with a key**

      Replace the key.

    - **If the engine starts with all keys**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC B3984: DEVICE 1 ENVIRONMENT IDENTIFIER NOT PROGRAMMABLE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC B3984

Device 1 Environment Identifier Not Programmable

For symptom byte information, refer to **Symptom Byte List** .

Circuit/System Description

When certain modules are programmed and configured during installation, the module learns a specific environment identifier which is unique to the vehicle. The environment identifier is used to prevent the swapping modules between vehicles. The body control module (BCM) is the keeper of the environment identifier. The instrument cluster, electronic brake control module, HVAC control module, inflatable restraint sensing and diagnostic module, engine control module (ECM), and steering column lock module (if equipped) each learn the environment identifier during their configuration process. During vehicle operation, the BCM sends the immobilizer identifier as a challenge and each module responds to the challenge by sending the environment identifier back to the BCM. If the BCM sends an incorrect immobilizer identifier or a specific number of incorrect environment identifiers are received, vehicle starting is disabled.

Conditions for Running the DTC

Ignition is in the ACCESSORY or RUN position.

Conditions for Setting the DTC

An incorrect environment identifier is programmed or no environment identifier is programmed.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

A current DTC will be cleared when the module learns a correct environment identifier.

DTC P0513: IMMOBILIZER KEY INCORRECT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Diagnostic Procedure Instructions provides an overview of each diagnostic category.

DTC Descriptor

DTC P0513

Immobilizer Key Incorrect

Circuit/System Description

The body control module (BCM) sends the pre - release information to the hybrid/EV powertrain control module 1 via the serial data circuit. The hybrid/EV powertrain control module 1 then sends a challenge to the BCM. Both the hybrid/EV powertrain control module 1 and BCM perform a calculation on this challenge. The engine control module (ECM) also monitors this challenge and calculates it's own result. If the calculated response from the BCM equals the calculation performed by the hybrid/EV powertrain control module 1 and ECM, the hybrid/EV powertrain control module 1 and ECM will allow vehicle propulsion.

Conditions for Running the DTC

Vehicle is ON or in Service Mode.

Conditions for Setting the DTC

Hybrid/EV Powertrain Control Module 1

The calculated response from the BCM does not equal the calculation performed by the hybrid/EV powertrain control module 1.

Engine Control Module

The calculated response from the BCM does not equal the calculation performed by the ECM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle propulsion will be disabled.

Conditions for Clearing the DTC

- A current DTC P0513 will be cleared when a valid calculation is received.
- A history DTC will be cleared after 40 malfunction-free power mode cycles or when a scan tool is used to clear DTCs.

Diagnostic Aids

The key referenced in the DTC descriptor does not refer to the vehicle key. In this case, key is referring to the challenge response.

Circuit/System Verification

1. Verify there are no immobilizer DTCs set in the K9 Body Control Module.
    - **If any immobilizer DTCs are set in the K9 Body Control Module**

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no immobilizer DTCs are set in the K9 Body Control Module**
2. Perform the K9 Body Control Module immobilizer learn using the Body Control Module IMMO Function with Existing Transponder or Remote Key in SPS. Refer to **Immobilizer System Component Programming**.
3. Verify the K9 Body Control Module successfully completes the learn procedure and DTC P0513 is not set.
    - **If the K9 Body Control Module does not successfully learn or DTC P0513 is set**

      Perform the appropriate immobilizer learn using the IMMO Learn in SPS. Refer to **Immobilizer System Component Programming**.

    - **If the K9 Body Control Module successfully completes the learn and DTC P0513 is not set**
4. All OK

DTC P0633: IMMOBILIZER KEY NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P0633

Immobilizer Key Not Programmed

Circuit/System Description

When learning the immobilizer data, as well as the challenge and response sequence, the engine control module (ECM) is placed in learn mode. DTC P0633 will set automatically as an indicator that the system is in learn mode and not as a fault indicator. Once the immobilizer data and challenge/response are learned, learn mode will be exited when the engine is successfully started. If the ECM does not exit learn mode, DTC P0633 will remain current and indicate a fault.

Conditions for Running the DTC

The ECM is in learn mode.

Conditions for Setting the DTC

DTC P0633 will set any time the ECM enters learn mode.

Action Taken When the DTC Sets

The security indicator in the instrument cluster will illuminate.

Conditions for Clearing the DTC

- A current DTC will be cleared upon a successful engine start after exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

Circuit/System Verification

NOTE: **DTC P0633 will clear upon a successful engine start. Any malfunction that will cause a no-start condition will prevent DTC P0633 from clearing. Prior to diagnosing DTC P0633, ensure that all power moding and engine control systems are operating properly and all conditions that may cause a no-start have been corrected. Do not replace the K20 Engine Control Module. Replacing the K20 Engine Control Module will not correct the no-start condition.**

1. Verify there are no immobilizer DTCs set in the K9 Body Control Module.
   - **If any immobilizer DTCs are set in the K9 Body Control Module**

        Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no immobilizer DTCs are set in the K9 Body Control Module**

2. Perform the K20 Engine Control Module immobilizer learn using the engine control module IMMO Learn in SPS. Refer to **Immobilizer System Component Programming**.
3. Verify the engine starts after the K20 Engine Control Module completes the learn procedure.
    - **If the engine does not start**

      An undiagnosed no-start condition exists. Refer to the appropriate subsection and diagnostic to correct the no-start condition.

    - **If the engine starts**
4. All OK.

DTC P162B: REMOTE VEHICLE SPEED LIMITING SIGNAL MESSAGE COUNTER INCORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P162B

Remote Vehicle Speed Limiting Signal Message Counter Incorrect

Circuit/System Description

When a remote slow-down request is sent from OnStar, the vehicle communication interface control module sends a serial data message to the engine control module (ECM) indicating that reduced vehicle speed has been requested. Once the request is active, the ECM begins reducing engine torque to match the requested vehicle speed and the REDUCED ENGINE POWER message is displayed.

Conditions for Running the DTC

- The engine run time is greater than 5 s
- A remote slow-down request is sent from OnStar

Conditions for Setting the DTC

- The VIN embedded in the slow-down request does not match the VIN stored in the ECM.
- The rolling code counter embedded in the slow-down request does not increment for ten consecutive messages.

Action Taken When the DTC Sets

- ECM ignores all reduced vehicle speed request messages from the vehicle communication interface module.
- The ECM stores DTC P162B in history.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear after 40 malfunction-free ignition cycles have occurred.

Circuit/System Verification

1. Verify the vehicle is equipped with OnStar (RPO UE1) and DTC P162B is set
    - **If the vehicle is not equipped with OnStar (RPO UE1) and DTC P162B is set**

      Replace the ECM.

    - **If the vehicle is equipped with OnStar (RPO UE1) and DTC P162B is set**
2. Perform the Remote Vehicle Speed Limiting Reset procedure with the scan tool.
3. Verify DTC P162B is not set.
    - **If DTC P162B is set**
    1. Reprogram the ECM. Refer to **Control Module References** .
    2. Verify the DTC does not set while operating the vehicle within the Conditions for Running the DTC.
        - If the DTC sets, replace the ECM. If the DTC continues to set after ECM replacement, replace the vehicle communication interface module.
        - If the DTC does not set
    3. All OK.
    - **If DTC P162B is not set**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC P1631: IMMOBILIZER FUEL ENABLE SIGNAL NOT CORRECT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1631

Immobilizer Fuel Enable Signal Not Correct

Circuit/System Description

The body control module (BCM) sends the pre - release information to the hybrid/EV powertrain control module 1 via the serial data circuit. The hybrid/EV powertrain control module 1 then sends a challenge to the BCM. Both the hybrid/EV powertrain control module 1 and BCM perform a calculation on this challenge. The engine control module (ECM) also monitors this challenge and calculates it's own result. If the calculated response from the BCM equals the calculation performed by the hybrid/EV powertrain control module 1 and ECM, the hybrid/EV powertrain control module 1 and ECM will allow vehicle propulsion.

Conditions for Running the DTC

Vehicle is ON or in Service Mode.

Conditions for Setting the DTC

Hybrid/EV Powertrain Control Module 1

The hybrid/EV powertrain control module 1 receives incorrect immobilizer data from the BCM.

Engine Control Module

The ECM receives incorrect immobilizer data from the BCM.

Action Taken When the DTC Sets

- The security indicator in the instrument cluster will illuminate.
- Vehicle starting will be disabled.

Conditions for Clearing the DTC

- A current DTC P1631 will be cleared when correct immobilizer data is received.
- A history DTC will be cleared after 40 malfunction-free power mode cycles or when a scan tool is used to clear DTCs.

Circuit/System Verification

1. Verify there are no immobilizer DTCs set in the K9 Body Control Module.
    - **If any immobilizer DTCs are set in the K9 Body Control Module**

Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

- **If no immobilizer DTCs are set in the K9 Body Control Module**

2. Perform the K9 Body Control Module immobilizer learn using the Body Control Module IMMO Function with Existing Transponder or Remote Key in SPS. Refer to **Immobilizer System Component Programming**.
3. Verify the K9 Body Control Module successfully completes the learn procedure and DTC P1631 is not set.
    - **If the K9 Body Control Module does not successfully learn or DTC P1631 is set**

      Perform the appropriate immobilizer learn using the IMMO Learn in SPS. Refer to **Immobilizer System Component Programming**.

    - **If the K9 Body Control Module successfully completes the learn and DTC P1631 is not set**
4. All OK

DTC P1649: IMMOBILIZER SECURITY CODE NOT PROGRAMMED

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

DTC Descriptor

DTC P1649

Immobilizer Security Code Not Programmed

Circuit/System Description

When learning the security code, as well as the challenge and response sequence, the engine control module (ECM) is placed in learn mode. Once the security code and challenge/response are learned, learn mode will be exited when the engine is successfully started.

Conditions for Running the DTC

The ECM is in learn mode.

Conditions for Setting the DTC

The ECM has not learned a security code.

Action Taken When the DTC Sets

The security indicator in the instrument cluster will illuminate.

Conditions for Clearing the DTC

- A current DTC will be cleared upon a successful engine start after exit of learn mode.
- A history DTC will be cleared after 100 malfunction-free ignition cycles.

      Refer to **Diagnostic Trouble Code (DTC) List - Vehicle** .

    - **If no immobilizer DTCs are set in the K9 Body Control Module**
2. Perform the K20 Engine Control Module immobilizer learn using the engine control module IMMO Learn in SPS. Refer to **Immobilizer System Component Programming**.
3. Verify the engine starts after the K20 Engine Control Module completes the learn procedure.
    - **If the engine does not start**

      Replace the K20 Engine Control Module.

    - **If the engine starts**
4. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

Control Module References for engine control module replacement, programming, and setup.

SYMPTOMS - IMMOBILIZER

IMPORTANT: The following steps must be completed before using the symptom tables.

1. Perform the **Diagnostic System Check - Vehicle** before using the symptom tables in order to verify that all of the following are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data links.
2. Review the system operation in order to familiarize yourself with the system functions. Refer to **Immobilizer Description and Operation**.

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the systems. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Faulty electrical connections or wiring may be the cause of intermittent conditions. Refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to **OnStar Stolen Vehicle Slowdown Active** to diagnose the symptom.

ONSTAR STOLEN VEHICLE SLOWDOWN ACTIVE

Diagnostic Instructions

NOTE: **This procedure is not used in Brazil.**

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- **Diagnostic Procedure Instructions** provides an overview of each diagnostic category.

Circuit/System Description

When a remote slow-down request is sent from OnStar, the Telematics Communication Interface Control Module sends a serial data message to the engine control module (ECM) indicating that reduced vehicle speed has been requested. Once the request is active, the ECM begins reducing engine torque to match requested vehicle speed and the REDUCED ENGINE POWER message is displayed.

Control Module References for scan tool information

Circuit/System Verification

1. Verify the vehicle is not in the OnStar initiated Stolen Vehicle Slowdown mode. This can be accomplished by verifying the scan tool Telematics Enhanced Service Immobilization parameter is No.
    - **If the scan tool Telematics Enhanced Service Immobilization parameter is Yes**
    1. Perform the Remote Vehicle Speed Limiting Reset procedure with the scan tool.
    2. Press the blue OnStar button and inform the advisor that you need to be transferred to the stolen vehicle team to update the vehicle account.
    - **If the scan tool BCM Telematics Enhanced Service Immobilization parameter is No**
2. All OK.

REPAIR INSTRUCTIONS

IMMOBILIZER SYSTEM COMPONENT PROGRAMMING

This procedure will learn the immobilizer function and require greater than 15 minutes to complete. If the battery voltage is low, charge the battery before proceeding with the learn. If the body control module (BCM) or engine control module (ECM) have been replaced, they must be programmed before performing this learn procedure.

Depending on the immobilizer function being learned or the component replaced, different learn functions are required to be performed. These learn functions are as follows:

Function name on SPS tool:	Function description:	When the function should be used:	Notes:
Body Control Module IMMO Function with Existing Transponder or Remote Key	The BCM will relearn the immobilizer passwords and data while reusing the existing vehicle keys	The BCM has been replaced and the existing vehicle keys are being reused or a diagnostic has instructed to perform the learn	-
Body Control Module IMMO Function with New Transponder or Remote Key	The BCM will relearn the immobilizer passwords and data while using new vehicle keys	The BCM has been replaced and new vehicle keys are being reused	-
Engine Control Module IMMO Learn	The ECM will relearn the immobilizer passwords and data	The ECM has been replaced or a diagnostic has instructed to perform the learn	-
Engine Control Module and Body Control Module IMMO Learn	The ECM and BCM will learn new immobilizer passwords and data	Both the ECM and BCM have been replaced (this selection will REQUIRE new vehicle keys be used)	Because both the ECM and BCM have been replaced and are learning new immobilizer passwords and data, all vehicle keys must also be replaced
Program Transponder or Remote Key (Add)	A new vehicle key will learn the immobilizer passwords and data	A new vehicle key is being added (does not affect other vehicle keys)	This function may not be available in all sales regions
Program Transponder or Remote Key (Delete)	All existing vehicle keys will be invalidated and any desired keys are relearned	All vehicle keys are desired to be invalidated and certain keys relearned or a diagnostic has instructed to perform the learn	This procedure may be used if a customer has had their keys lost or stolen and wishes to invalidate the keys, making them unable to start the vehicle

1. Connect a scan tool to the vehicle and access SPS.
2. Vehicle in Service Mode, engine OFF.
3. Ensure that all power consuming devices are turned OFF on the vehicle.
4. Select SPS application and follow the on-screen instructions.
5. Select Reprogram ECU.
6. Select IMMO Immobilizer Learn - Setup.
7. Select the appropriate programming function based on the component that was replaced or is being programmed. Refer to the table at the top of this document for assistance in choosing the correct programming function.

NOTE:

- **At multiple times during the learn procedure, SPS will instruct you to turn the vehicle to Service Mode. Make sure the vehicle**

is actually in the Service Mode before continuing on the SPS terminal. If the vehicle is not in the Service Mode, the learn procedure will fail.

- **The key pocket is located in the center console under the small tray. The key must be placed with the buttons facing down.**

8. Follow the on-screen instructions.

NOTE: **If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.**

9. After programming all keys "Programming Complete" is displayed.
10. Press and hold the vehicle ON/OFF switch for 15 seconds.
11. Press the lock and unlock button on each transmitter that was programmed. This will awaken each transmitter and allow passive and active keyless entry functions to be established.
12. With a scan tool, clear any DTCs.
13. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the transmitter and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Unable to Complete Programming

When attempting to program immobilizer components, various conditions may prevent the programming operation from completing. These conditions may be caused by normal system operation, a system malfunction, or an external influence. Common symptoms of a incomplete programming is receiving an error message during the attempt or having the SPS application become unresponsive.

- DTCs are set in the body control module (BCM)

  The immobilizer system is a function of the BCM software. If immobilizer DTCs are set in the BCM, such as DTC B2955, a fault has been identified in the immobilizer system. If this is not corrected before attempting to program components, the programming may not complete. Correct all immobilizer DTCs before attempting to program any immobilizer components.

- The key has been programmed to another vehicle or is not the correct type for the vehicle

  A key can only be programmed to a single vehicle. Once a key is programming to a vehicle, it is paired for the life of the key. The key can be learned to the same vehicle again and again, but it is not able to be programmed to a different vehicle.

  Many vehicle are available with both a base keyless entry system and an optional passive entry system. These keys typically look identical but cannot be substituted for one another. To verify the key is correct, compare the part number that is etched on the key to the part number identified in the parts catalog. The key should be correct for the system installed in the vehicle.

- The theft deterrent module is not properly secured or the key is not properly positioned in the pocket/slot.

  A theft deterrent module that is not fully seated or is otherwise not properly secured may prevent a coupling between the transponder located in the key and the theft deterrent module. Being out of place by as little as 1 mm may prevent programming from completing. Make sure the theft deterrent module is properly installed and fully seated in it's clip.

  The key shank must be fully extended so that the entire key shank fits into the programming slot.

  To determine if the theft deterrent module is properly secured, remove the battery from the key and place the key into the pocket/slot. Attempt to change the vehicle mode by pressing the vehicle ON/OFF switch. The vehicle should change modes. If the NO REMOTE DETECTED message is displayed on the DIC, the theft deterrent module may not be properly secured.

- External interference is interrupting the programming operation

  External RF interference and EMI may interrupt the low frequency coupling between the key and theft deterrent module. This interference may come from many different locations. Devices plugged into the vehicle power outlets such as cell phone chargers, laptop computers, GPS devices, etc. may cause interference. Vehicle location may also cause interference. Locations near airports and military installations may causer interference. Remove all customer installed devices and, if necessary, move the vehicle if interference is suspected.

KEY WITH INTEGRATED TRANSMITTER PROGRAMMING

Keys can be programmed in various ways using the procedures outlined below. Using the Replacing Keys procedures will first erase all the known keys from the vehicle. Any existing keys and any new keys will then be programmed. This procedure should be used any time a key is required to be unlearned or erased from a vehicle. If a new key is being learned to a vehicle to replace a damaged, inoperative, or stolen key, the Replacing Keys procedure must be used. This ensures that the old key cannot be used to access or start the vehicle after programming.

The Adding Keys procedure does not erase any keys prior to programming. The procedure will simply program the key into the next available slot. The Adding Keys procedure should only be used when adding an additional key to the vehicle. The Adding Keys procedure should never be used to program a key to a vehicle that is having a key replaced, regardless of the cause for the replacement.

Replacing Keys (Without SPS)

NOTE:

- **This procedure will unlearn all previously learned keys. All keys that are to be programmed must be with the vehicle.**
- **This procedure will take approximately 30 minutes to complete.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**
- **This procedure may be used with or without existing learned keys being present. If existing keys are present, keep the keys away from the vicinity of the vehicle. Failure to keep learned keys away from the vehicle will result in the learn changing to the Adding Keys procedure.**
- **The keys to be learned must duplicate the mechanical cut of the current key.**

1. Insert the mechanical key of the new key into the key lock cylinder located on the outside of the driver door and turn the key to the unlock position five times within ten seconds. The Driver Information Center (DIC) will display Remote Learn Pending, Please Wait.
2. After ten minutes, the DIC will display Press Engine Start Button To Learn. Press the vehicle ON/OFF switch. The DIC will again display Remote Learn Pending, Please Wait.
3. Repeat Step 2 two additional times, for a total of thirty minutes. All previously known keys have now been unlearned. Remaining keys can be relearned during the next steps. The DIC display will now display Ready For Remote # 1.

   NOTE: **The key pocket is located in the center console under the small tray. The key must be placed with the buttons facing down.**

4. Place the new key into the key pocket.

   NOTE: **If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.**

5. Press the vehicle ON/OFF switch. When the key is learned the DIC will indicate that it is ready to program the next key.
6. Remove the key from the key pocket and press the unlock button. To program additional keys, repeat Steps 4 through 6.
7. When all additional keys are programmed, press and hold the vehicle ON/OFF switch for 5 seconds to exit programming mode.

Replacing Keys (With SPS)

NOTE:

- **This procedure will unlearn all previously learned keys. All keys that are to be programmed must be with the vehicle.**
- **This procedure may be used with or without existing learned keys being present.**
- **This procedure will take more than 15 minutes to complete.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**
- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. Connect a scan tool to the vehicle and access SPS.
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Delete) function.

   NOTE:

   - **At multiple times during the learn procedure, SPS will instruct you to turn the vehicle to Service Mode. Make sure the vehicle is actually in the Service Mode before continuing on the SPS terminal. If the vehcile is not in the Service Mode, the learn procedure will fail.**
   - **The key pocket is located in the center console under the small tray. The key must be placed with the buttons facing down.**

7. Follow the on-screen instructions.

   NOTE: **If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.**

8. After programming all keys, Programming Complete, is displayed.
9. Press and hold the vehicle ON/OFF switch for 15 seconds.
10. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow passive and active keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Adding Keys (Without SPS)

NOTE:

- **To initiate, this procedure requires that 2 learned keys be available.**

- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure adds keys only. The procedure does not erase previously learned keys.**
- **The keys to be learned must duplicate the mechanical cut of the current key.**

1. Place the recognized keys in the vehicle cupholder.
2. Insert the mechanical key of the new key into the key lock cylinder located on the outside of the driver door and turn the key to the unlock position five times within ten seconds. The Driver Information Center (DIC) will display Ready For Remote #2, 3, 4 or 5.

NOTE: **The key pocket is located in the center console under the small tray. The key must be placed with the buttons facing down.**

3. Place the new key into the key pocket.

NOTE: **If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.**

4. Press and hold the vehicle ON/OFF switch for two seconds. When the key is programmed, the DIC will show that it is ready to program the next key.
5. Remove the key from the key slot and press the unlock button. To program additional keys, repeat Steps 3 through 5.
6. When all additional keys are programmed, press and hold the vehicle ON/OFF switch for 10 seconds to exit programming mode.

Adding Keys (With SPS)

NOTE:

- **This procedure may be used with or without existing learned keys being present.**
- **This procedure will take more than 15 minutes to complete.**
- **A total of eight keys maybe be learned to a single vehicle.**
- **This procedure will only learn the vehicle key information. This procedure will not learn any immobilizer information between the body control module (BCM) and engine control module (ECM).**
- **If the battery voltage is low, charge the battery before continuing with the procedure.**

1. Connect a scan tool to the vehicle and access SPS.
2. Ensure that all power consuming devices are turned OFF on the vehicle.
3. Select the SPS application and follow the on-screen instructions.
4. Select Reprogram ECU.
5. Select IMMO Immobilizer Learn - Setup.
6. Select the Program Transponder or Remote Key (Add) function.

NOTE:

- **At multiple times during the learn procedure, SPS will instruct you to turn the vehicle to Service Mode. Make sure the vehicle is actually in the Service Mode before continuing on the SPS terminal. If the vehcile is not in the Service Mode, the learn procedure will fail.**
- **The key pocket is located in the center console under the small tray. The key must be placed with the buttons facing down.**

7. Follow the on-screen instructions.

NOTE: **If the programming does not complete or hangs during the programming operation, refer to Unable to Complete Programming below.**

8. After programming all keys, Programming Complete, is displayed.
9. Press and hold the vehicle ON/OFF switch for 15 seconds.
10. Press the lock and unlock button on each key that was programmed. This will awaken each key and allow passive and active keyless entry functions to be established.
11. With a scan tool, clear any DTCs.
12. Verify each key is operating properly. Operate each of the keyless entry functions using the buttons on the key and then start the vehicle. When verifying operation, make sure that no other keys are near the vehicle.

Unable to Complete Programming

When attempting to program immobilizer components, various conditions may prevent the programming operation from completing. These conditions may be caused by normal system operation, a system malfunction, or an external influence. Common symptoms of a incomplete programming is receiving an error message during the attempt or having the SPS application become unresponsive.

- DTCs are set in the body control module (BCM)

  The immobilizer system is a function of the BCM software. If immobilizer DTCs are set in the BCM, such as DTC B2955, a fault has been identified in the immobilizer system. If this is not corrected before attempting to program components, the programming may not complete. Correct all immobilizer DTCs before attempting to program any immobilizer components.

- The key has been programmed to another vehicle or is not the correct type for the vehicle

  A key can only be programmed to a single vehicle. Once a key is programming to a vehicle, it is paired for the life of the key. The key can be learned to the same vehicle again and again, but it is not able to be programmed to a different vehicle.

  Many vehicle are available with both a base keyless entry system and an optional passive entry system. These keys typically look identical but cannot be substituted for one another. To verify the key is correct, compare the part number that is etched on the key to the part number identified in the parts catalog. The key should be correct for the system installed in the vehicle.

- The theft deterrent module is not properly secured or the key is not properly positioned in the pocket/slot.

  A theft deterrent module that is not fully seated or is otherwise not properly secured may prevent a coupling between the transponder located in the key and the theft deterrent module. Being out of place by as little as 1 mm may prevent programming from completing. Make sure the theft deterrent module is properly installed and fully seated in it's clip.

  The key shank must be fully extended so that the entire key shank fits into the programming slot.

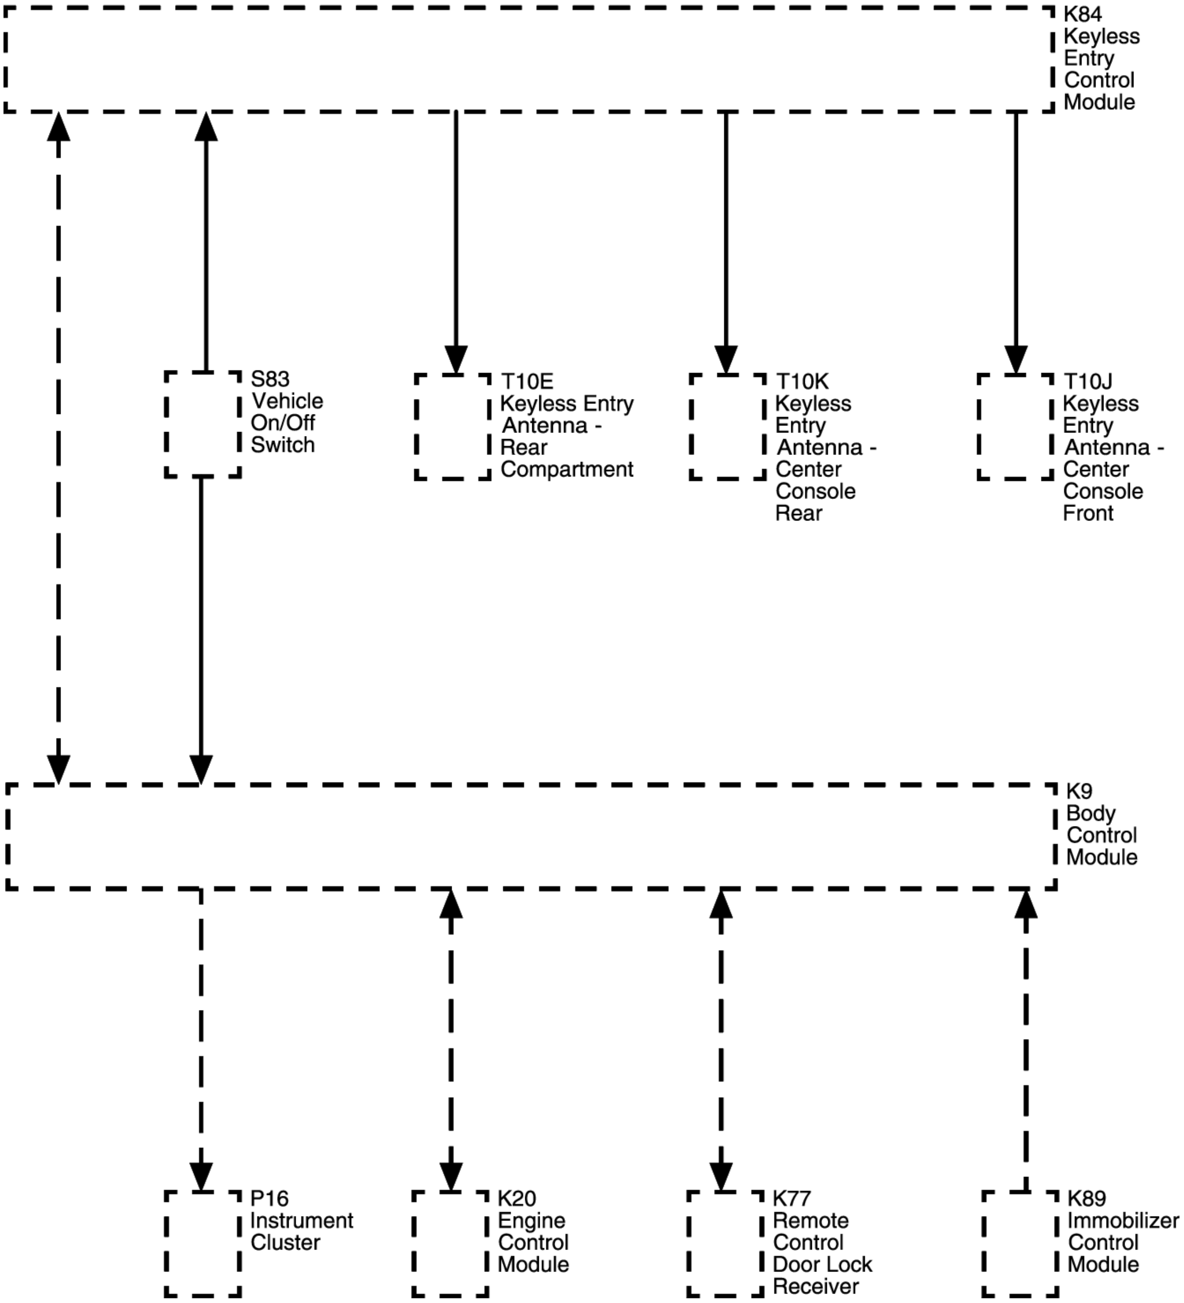
  To determine if the theft deterrent module is properly secured, remove the battery from the key and place the key into the pocket/slot. Attempt to change the vehicle mode by pressing the vehicle ON/OFF switch. The vehicle should change modes. If the NO REMOTE DETECTED message is displayed on the DIC, the theft deterrent module may not be properly secured.

- External interference is interrupting the programming operation

  External RF interference and EMI may interrupt the low frequency coupling between the key and theft deterrent module. This interference may come from many different locations. Devices plugged into the vehicle power outlets such as cell phone chargers, laptop computers, GPS devices, etc. may cause interference. Vehicle location may also cause interference. Locations near airports and military installations may causer interference. Remove all customer installed devices and, if necessary, move the vehicle if interference is suspected.

DESCRIPTION AND OPERATION

IMMOBILIZER DESCRIPTION AND OPERATION



K84 Keyless Entry Control Module
S83 Vehicle On/Off Switch
T10E Keyless Entry Antenna - Rear Compartment
T10K Keyless Entry Antenna - Center Console Rear
T10J Keyless Entry Antenna - Center Console Front
K9 Body Control Module
P16 Instrument Cluster
K20 Engine Control Module
K77 Remote Control Door Lock Receiver
K89 Immobilizer Control Module

Fig. 2: Immobilizer System Diagram
Courtesy of GENERAL MOTORS COMPANY

The immobilizer system functions are provided by the keyless entry control module, remote control door lock receiver, body control module (BCM), hybrid/EV powertrain control module 1, and engine control module (ECM), as well as any modules which store and report the environment identifier. The keyless start system use low frequency antennas in three different locations on the vehicle to determine the location of the transmitter. Multiple antenna are used to ensure complete coverage of the vehicle interior and rear compartment.

When the vehicle ON/OFF switch is pressed, the low frequency antennas emit a challenge to the keyless entry transmitter. The transmitter receives this challenge and emits it's response as an RF message. The transmitter transmits a signal that contains its unique value, which is received by the BCM through the remote control door lock receiver. The BCM then compares this value to a value stored in memory. The BCM also monitors various modules to determine if the stored environment identifiers match.

If both the environment identifier and the value received from the transponder match, the BCM will send the prerelease password via serial data to the hybrid/EV powertrain control module 1. If the encrypted code's unique value is incorrect or the environment identifier does not match, the BCM will send the fuel disable message to the hybrid/EV powertrain control module 1.

When the hybrid/EV powertrain control module 1 receives the BCM prerelease password, the hybrid/EV powertrain control module 1 will challenge the password. The hybrid/EV powertrain control module 1 sends this challenge to the BCM via serial data. Both the hybrid/EV powertrain control module 1 and BCM perform a calculation on this challenge. Additionally, the ECM will also monitor this challenge and calculate it's own response. If the BCM calculated response to the challenge equals the calculation performed by the hybrid/EV powertrain control module 1 and ECM, the hybrid/EV powertrain control module 1 and ECM will allow vehicle propulsion.

If RF communication is interrupted, a "No Remote Detected" message will be displayed on the DIC. In these cases, the extended transmitter key blade can be placed in the transmitter slot located in the upper instrument panel storage compartment, under the rubber mat. The immobilizer antenna coil is located directly beneath the transmitter slot. Placing the transmitter in the pocket will create a low powered coupling between the transmitter and immobilizer antenna, allowing communications to occur and enabling vehicle starting.

The components of the theft system are as follows:

- BCM
- Hybrid/EV powertrain control module 1
- ECM
- Immobilizer antenna
- Ignition key or keyless entry transmitter
- Security indicator
- Various modules which store and report the environment identifier

Body Control Module (BCM)

The immobilizer system is an integral part of the BCM and is controlled internally within the BCM. The BCM can learn up to 8 keys (transponder values).

The BCM uses the following inputs:

- Environment identifier exchange with various modules
- Encrypted code from the vehicle key, received by the immobilizer antenna

The BCM uses the following outputs:

- Prerelease password communication with ECM
- Challenge/response with ECM

When the vehicle ON/OFF switch is pressed, the low frequency antennas emit a challenge to the keyless entry transmitter. The transmitter receives this challenge and emits it's response as an RF message. The transmitter transmits a signal that contains its unique value, which is received by the BCM through the remote control door lock receiver. The BCM then compares this value to a value stored in memory. The BCM then performs one of the following functions:

- If the encrypted code value matches the values stored in the BCM memory, the BCM will send the prerelease password to the ECM via serial data.
- If the encrypted code unique value does not match the value stored in the BCM, the BCM will send the start disable message to the ECM via serial data.
- If the BCM is unable to measure the ignition key encrypted code value, the BCM will not send any messages to the ECM.

Hybrid/EV Powertrain Control Module 1

When the hybrid/EV powertrain control module 1 receives the BCM prerelease password, the hybrid/EV powertrain control module 1 will challenge the password. The hybrid/EV powertrain control module 1 sends this challenge to the BCM via the serial data circuit. Both the hybrid/EV powertrain control module 1 and BCM perform a calculation on this challenge. If the calculated response from the BCM equals the calculation performed by the hybrid/EV powertrain control module 1, the hybrid/EV powertrain control module 1 will allow vehicle propulsion.

The hybrid/EV powertrain control module 1 will disable vehicle propulsion if any of the following immobilization conditions occur:

- The prerelease password is invalid.
- The start disable password is sent by the BCM.
- No passwords are received. There is no communication with the BCM.
- The BCM calculated response to the challenge does not equal the calculation performed by the hybrid/EV powertrain control module 1.

Engine Control Module (ECM)

The ECM functions in the immobilizer system as a type of slave device. It does not general the password challenge, but it does monitor the challenge and response messages between the BCM and hybrid/EV powertrain control module 1. The ECM will calculate it's own result to the challenge. If the ECM response does not equal the BCM response, the ECM may also disable vehicle propulsion. To allow vehicle propulsion, the response from the BCM, ECM, and hybrid/EV powertrain control module 1 must all match.

The ECM will disable vehicle propulsion if any of the following immobilization conditions occur:

- The start disable password is sent by the BCM.
- No passwords are received. There is no communication with the BCM or hybrid/EV powertrain control module 1.
- The BCM calculated response to the challenge does not equal the calculation performed by the ECM.

Immobilizer Antenna

The immobilizer antenna contains an immobilizer coil. The coil passively powers the transponder located in the ignition key when the key is in the transmitter slot. When powered, the key transmits its unique value to the immobilizer antenna, which is then relayed to the BCM via a LIN serial data circuit. The immobilizer antenna also receives B+ and ground from the BCM.

The immobilizer antenna is used to:

1. Learn keys
2. To start vehicle with or without RF interference
3. To start vehicle when key battery is dead

Keyless Entry Transmitter

Each keyless entry transmitter contains a transponder with a unique encrypted value. The transponder's encrypted value is fixed and unable to be changed. The immobilizer system uses the transponder value to determine if a valid transmitter is being used to start the vehicle.

Environment Identifier

Various modules throughout the vehicle learn a specific environment identifier during the module programming process. The environment identifier is learned by each individual module and matches the environment identifier stored in the BCM. Prior to starting after a battery disconnect, each of the modules which store a environment identifier will compare their identifier to that of the identifier stored in the BCM. If all the identifiers match, the engine starting process will continue. If the environment identifiers do not match, engine starting will be disabled.

Security Indicator

The BCM will command the instrument panel cluster to illuminate the security indicator when the vehicle is in Service Mode to indicate a fault has occurred within the immobilizer system and when the engine starting is disabled.

REMOTE VEHICLE SPEED LIMITING DESCRIPTION AND OPERATION

Certain vehicles equipped with OnStarÃ,Â® now have an additional feature that allows for remote limiting of the vehicle's speed. This OnStarÃ,Â® feature is called Stolen Vehicle Slow-Down and is now part of the OnStarÃ,Â® Stolen Vehicle Assistance service. This feature, when used in conjunction with local law enforcement and strict guidelines at the OnStarÃ,Â® Call Center, will slow the vehicle by interacting with the engine control system.

When the engine control system receives a valid request from the OnStarÃ,Â® telematics communications interface module, it will enter into a reduced engine power/vehicle speed limiting mode, which will decelerate the vehicle. Once the request is active the engine control module begins reducing engine torque to match requested vehicle speed and a REDUCED ENGINE POWER indication is displayed. No DTCs will be set during this process.

SPECIFICATIONS

FASTENER SPECIFICATIONS

Reusable Threaded Fastener Tightening Specifications

Application	Specification
	Metric (English)
NOTE: ***All fasteners listed in this table can be reused after removal.***	
Armrest Hinge Reinforcement Assembly Bolt	3 N.m (27 lb in)
Armrest Hinge Reinforcement Assembly Screw	2 N.m (18 lb in)
Diagnostic Link Connector Bolt	2.5 N.m (22 lb in)
Front Floor Console Armrest Hinge Bolt	4.5 N.m (40 lb in)
Front Floor Console Armrest Hinge Screw	2.5 N.m (22 lb in)
Front Floor Console Bolt	3 N.m (27 lb in)
Front Floor Console Cup Holder Bolt	3 N.m (27 lb in)
Front Floor Console Cup Holder Trim Plate Bolt	3 N.m (27 lb in)
Front Floor Console Cup Holder Trim Plate Screw	2.5 N.m (22 lb in)
Front Floor Console Nut	5 N.m (44 lb in)
Heater and Air Conditioning Evaporator and Blower Module Bolt	5 N.m (44 lb in)
Instrument Panel Airbag Bolt	10 N.m (89 lb in)
Instrument Panel Bolt	2.5 N.m (22 lb in)
Instrument Panel Compartment Center Upper Bracket Bolt	10 N.m (89 lb in)
Instrument Panel Knee Bolster Bolt	2.5 N.m (22 lb in)
Instrument Panel Lower Trim Panel Bolt	1.5 N.m (13 lb in)
Instrument Panel Tie Bar Brace Bolt	22 N.m (16 lb ft)
Instrument Panel Tie Bar Reinforcement Bolt	22 N.m (16 lb ft)
Instrument Panel Tie Bar Side Bolt	22 N.m (16 lb ft)
Instrument Panel Tie Bar Upper Bolt	22 N.m (16 lb ft)
Rear Console Side Panel Bolt	3 N.m (27 lb in)
Rear Floor Console Bolt	9 N.m (80 lb in)
Rear Floor Console Stowage Tray Bolt	3 N.m (27 lb in)

REPAIR INSTRUCTIONS

INSTRUMENT PANEL LOWER TRIM PANEL INSULATOR REPLACEMENT

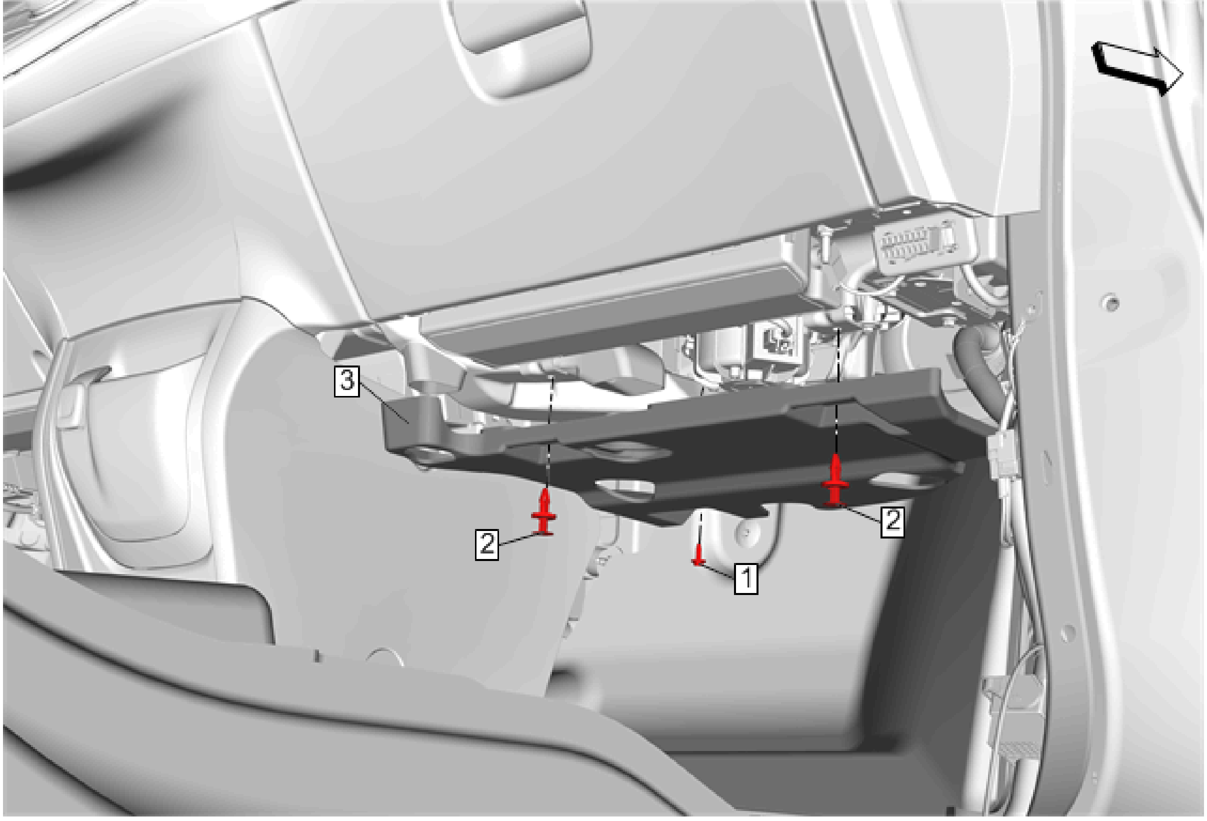

Fig. 1: Instrument Panel Lower Trim Panel Insulator
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
WARNING: **Refer to SIR Warning .** **Preliminary Procedure** Disable the SIR system. SIR Disabling and Enabling	
1	Instrument Panel Lower Trim Panel Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 1.5 N.m (13 lb in)
2	Instrument Panel Lower Insulator Retainer (Qty: 2) **Procedure** Use a flat bladed plastic tool to remove the push-in retainers.
3	Instrument Panel Lower Trim Panel Insulator **Procedure** Enable the SIR system. SIR Disabling and Enabling

INSTRUMENT PANEL KNEE BOLSTER REPLACEMENT

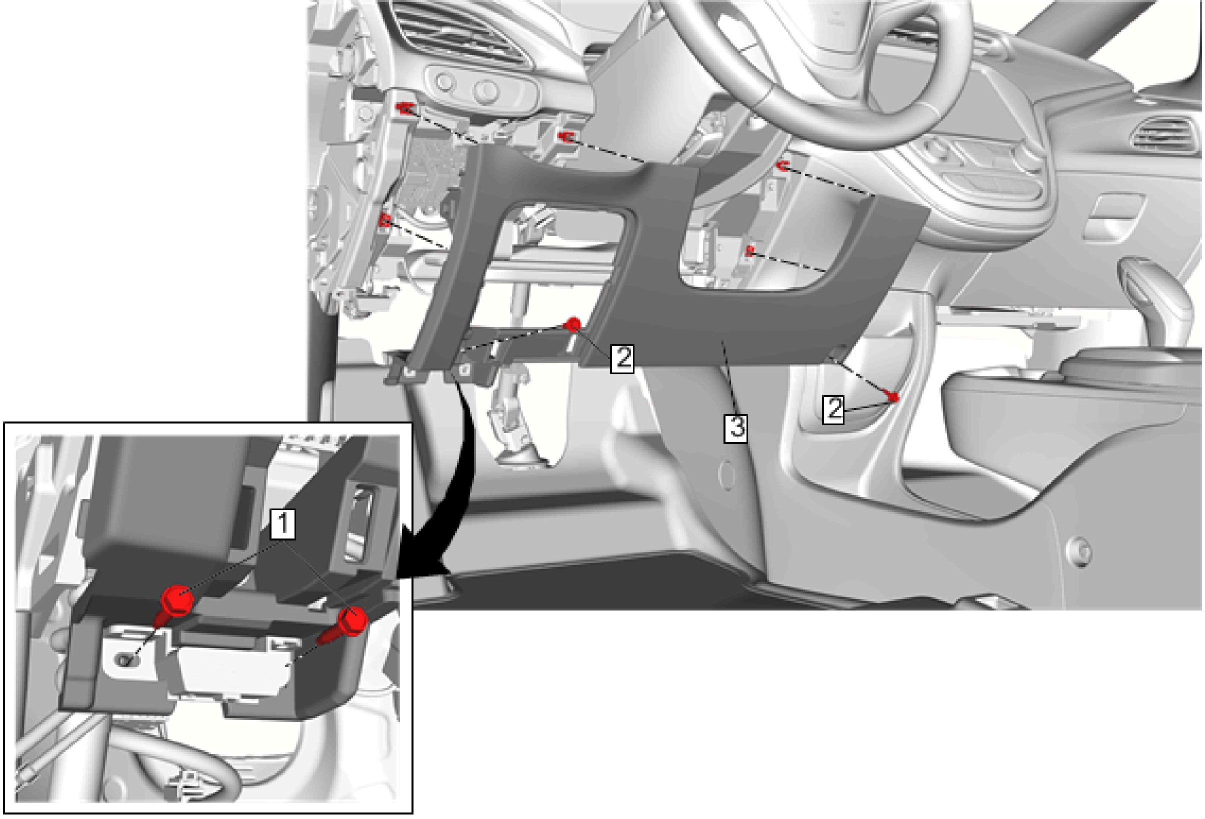

Fig. 2: Instrument Panel Knee Bolster
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. Instrument Panel Outer Trim Cover Replacement 2. Instrument Panel Fuse Block Access Hole Cover Replacement	
1	Diagnostic Link Connector Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Instrument Panel Knee Bolster Bolt (Qty: 2) **Tighten** 2.5 N.m (22 lb in)
3	Instrument Panel Knee Bolster **Procedure** Use a flat bladed plastic trim tool.

INSTRUMENT PANEL TRIM PLATE REPLACEMENT

Removal Procedure

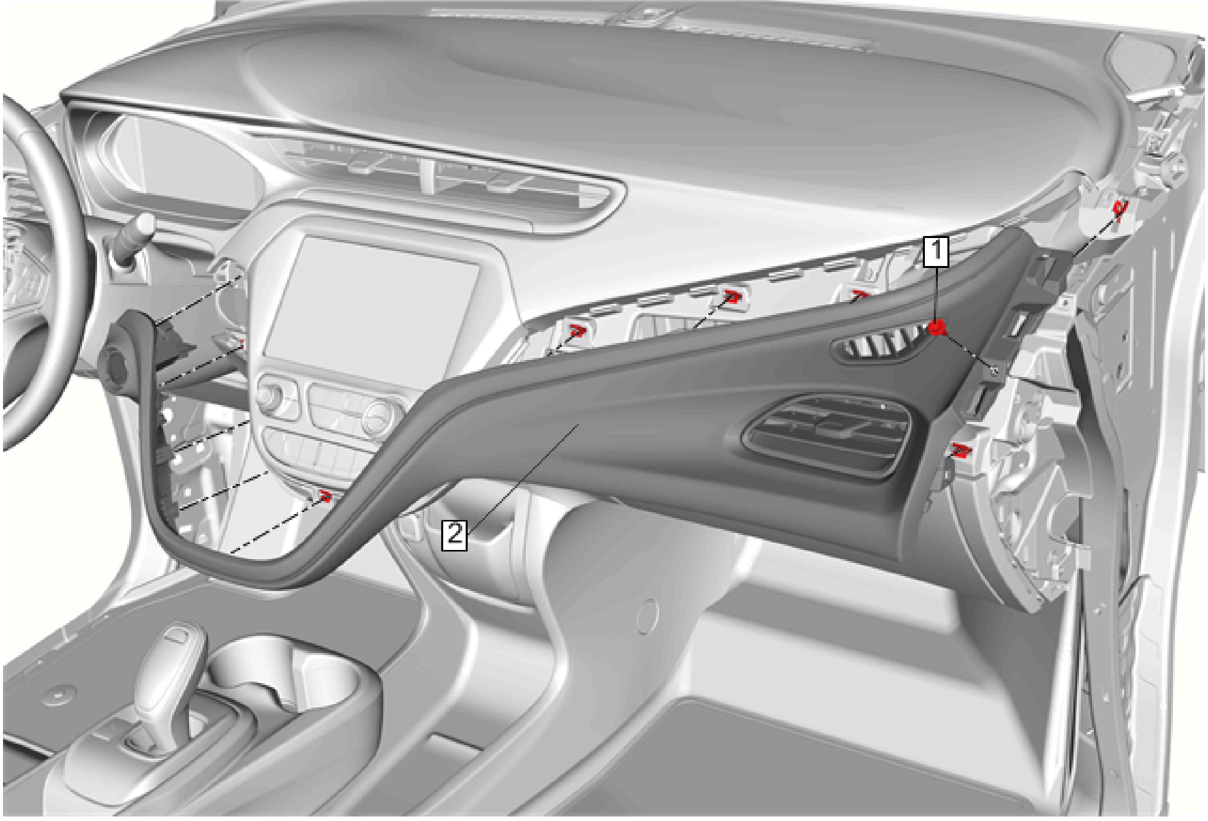

Fig. 3: Instrument Panel Trim Pad - Right Side
Courtesy of GENERAL MOTORS COMPANY

1. Instrument Panel Trim Pad - Right Side - Remove - **Instrument Panel Trim Pad Replacement - Right Side**

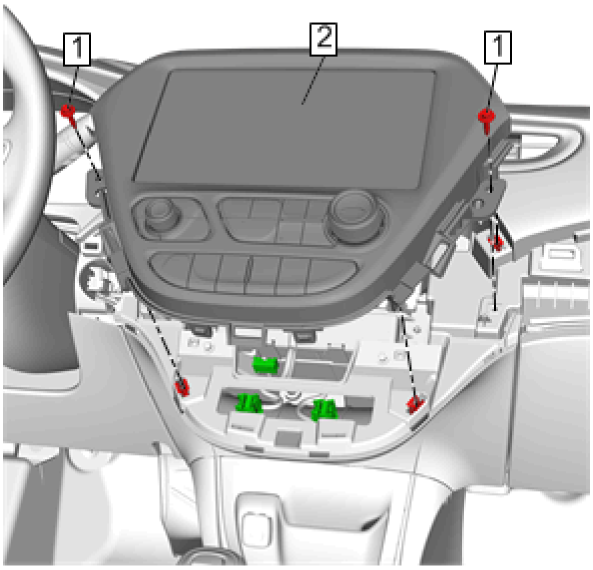

Fig. 4: Instrument Panel Bolt
Courtesy of GENERAL MOTORS COMPANY

2. Instrument Panel Bolt (1) - Remove
3. Instrument Panel Trim Plate Assembly (2) at Instrument Panel - Remove
4. Disconnect the electrical connectors.

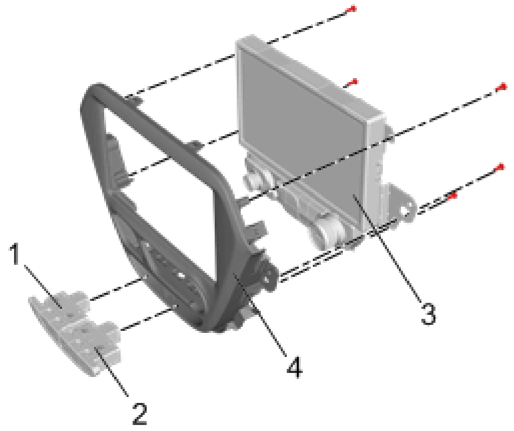

Fig. 5: Hazard Warning Switch at Instrument Panel Trim Plate
Courtesy of GENERAL MOTORS COMPANY

5. Hazard Warning Switch (1) at Instrument Panel Trim Plate - Remove - **Hazard Warning Switch Replacement**
6. Instrument Panel Center Accessory Function Switch (2) at Instrument Panel Trim Plate - Remove - **Instrument Panel Center Accessory Function Switch Replacement**
7. Driver Information Display (3) at Instrument Panel Trim Plate - Remove - **Driver Information Display Replacement**

Installation Procedure

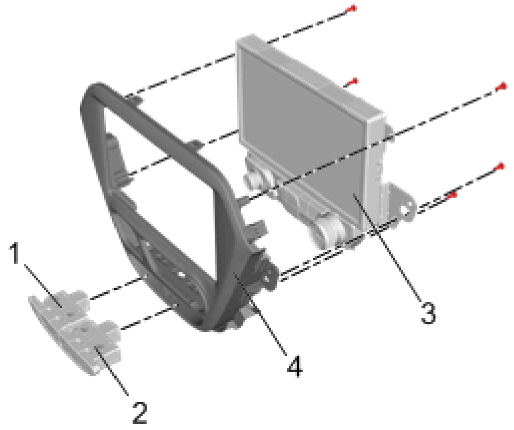

Fig. 6: Hazard Warning Switch at Instrument Panel Trim Plate
Courtesy of GENERAL MOTORS COMPANY

1. Driver Information Display (3) at Instrument Panel Trim Plate - Install - **Driver Information Display Replacement**
2. Instrument Panel Center Accessory Function Switch (2) at Instrument Panel Trim Plate - Install - **Instrument Panel Center Accessory Function Switch Replacement**
3. Hazard Warning Switch (1) at Instrument Panel Trim Plate - Install - **Hazard Warning Switch Replacement**

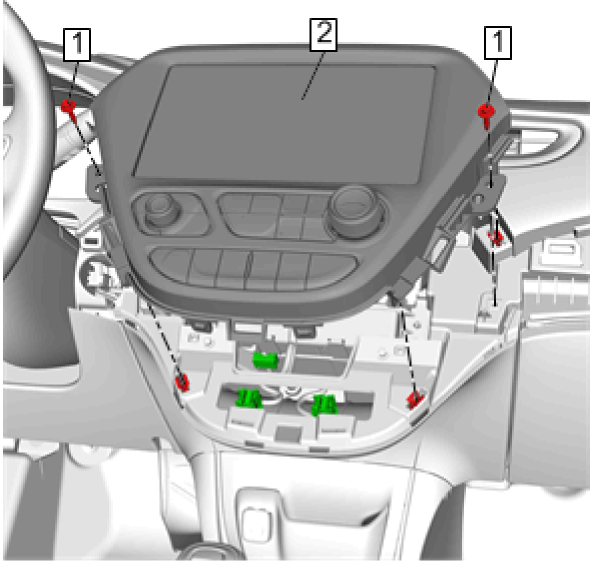

Fig. 7: Instrument Panel Trim Plate With Driver Information Display

7. Instrument Panel Trim Pad - Right Side - Install - Instrument Panel Trim Pad Replacement - Right Side

FORWARD COLLISION ALERT DISPLAY BEZEL REPLACEMENT

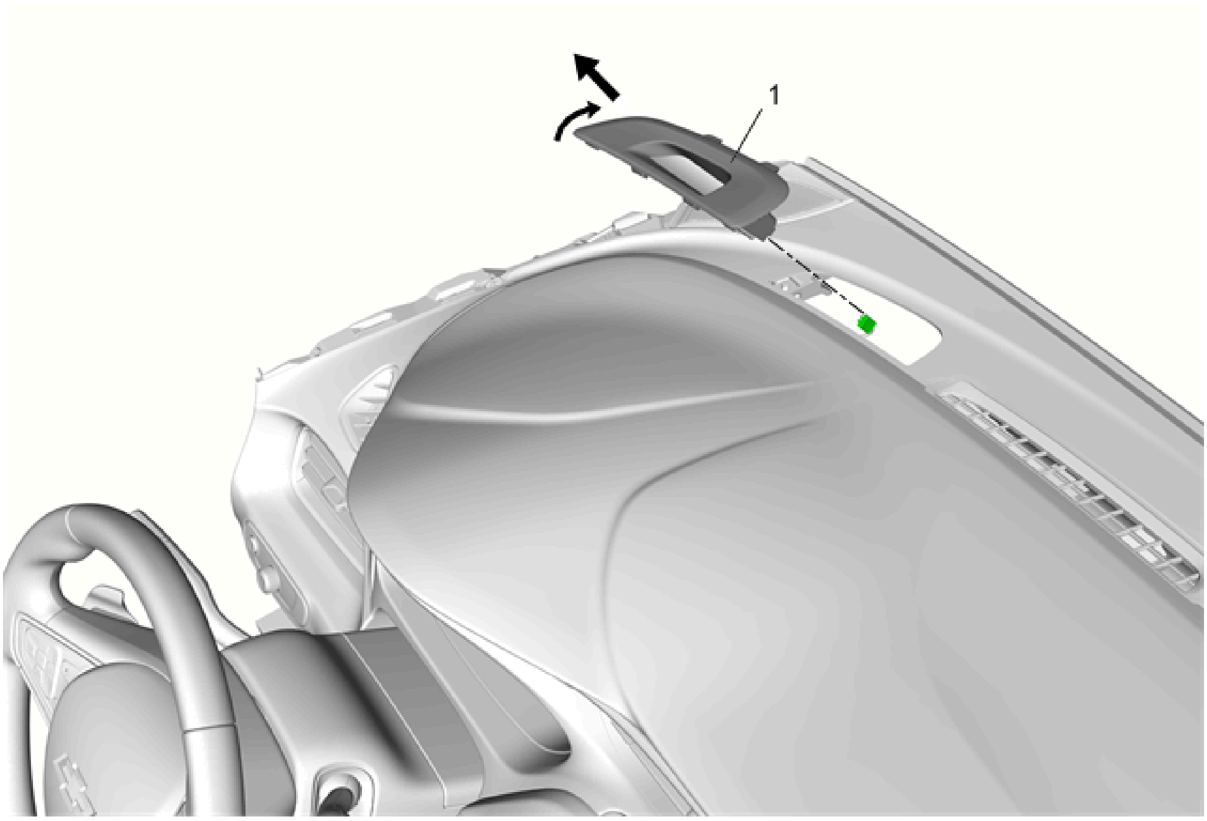

Fig. 9: Forward Collision Alert Display Bezel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Forward Collision Alert Display Bezel **Procedure** 1. Use a flat bladed plastic trim tool. 2. Release the plastic retaining tabs. 3. Disconnect the electrical connector. 4. Remove the forward collision alert display. **Forward Collision Alert Display Replacement**

INSTRUMENT PANEL FUSE BLOCK ACCESS HOLE COVER REPLACEMENT

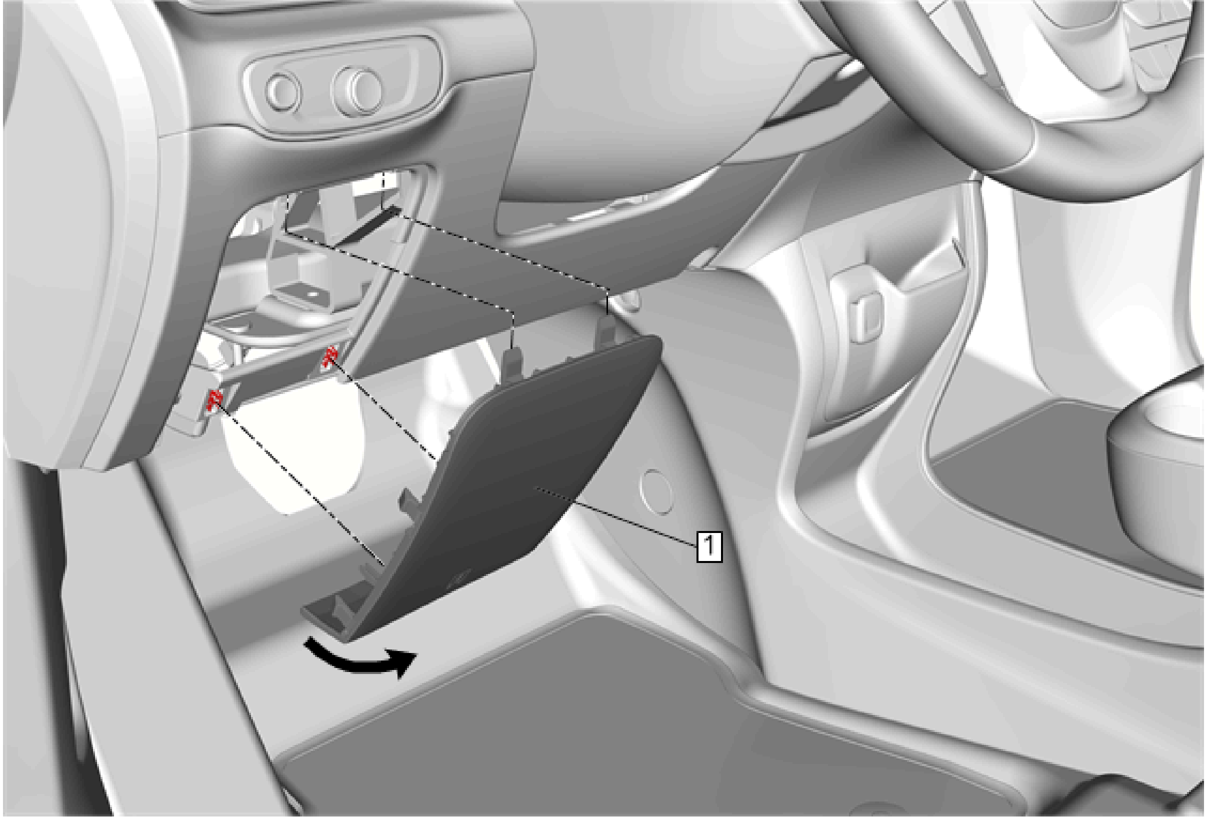

Fig. 10: Instrument Panel Fuse Block Access Hole Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Instrument Panel Fuse Block Access Hole Cover **Procedure** Grasp the lower edge of the fuse block cover and pull outward disengaging the retainers securing the fuse block cover to the instrument panel knee bolster.

INSTRUMENT PANEL OUTER TRIM COVER REPLACEMENT

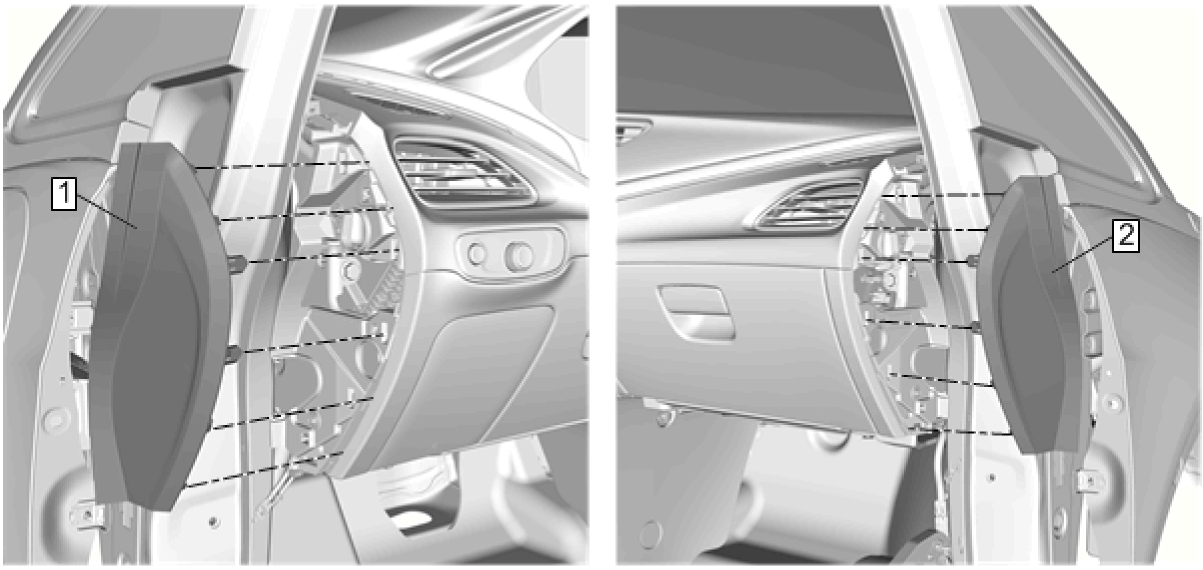

Fig. 11: Instrument Panel Outer Trim Cover
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Instrument Panel Outer Trim Cover - Left **Procedure** Use a flat bladed plastic trim tool.
2	Instrument Panel Outer Trim Cover - Right **Procedure** Use a flat bladed plastic trim tool.

INSTRUMENT PANEL LOWER TRIM PANEL REPLACEMENT

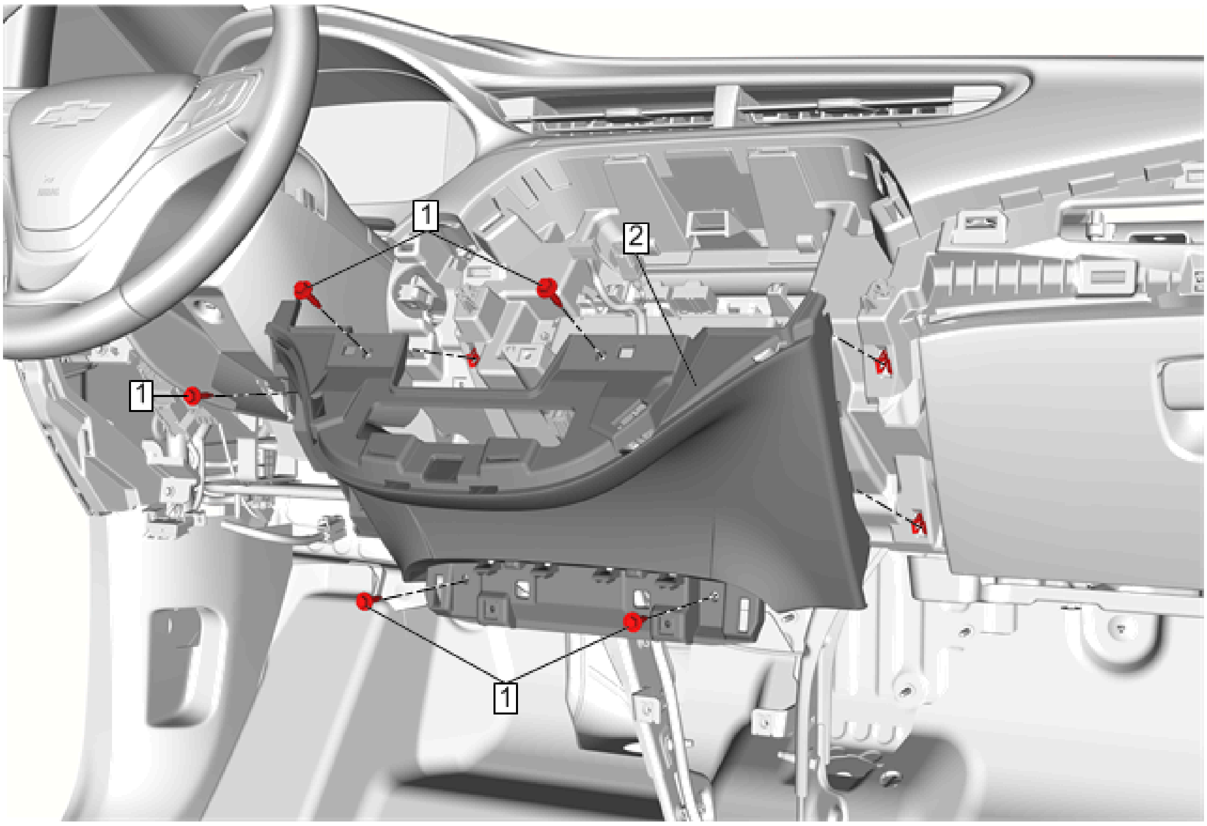

Fig. 12: Instrument Panel Lower Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Front Floor Console Replacement 2. Instrument Panel Trim Pad Replacement - Right Side 3. Instrument Panel Trim Plate Replacement 4. Instrument Panel Knee Bolster Replacement	
1	Instrument Panel Bolt (Qty: 5) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Instrument Panel Lower Trim Panel **Procedure** 1. Use a flat bladed plastic trim tool. 2. Release the plastic retaining tabs.

INSTRUMENT PANEL COMPARTMENT REPLACEMENT

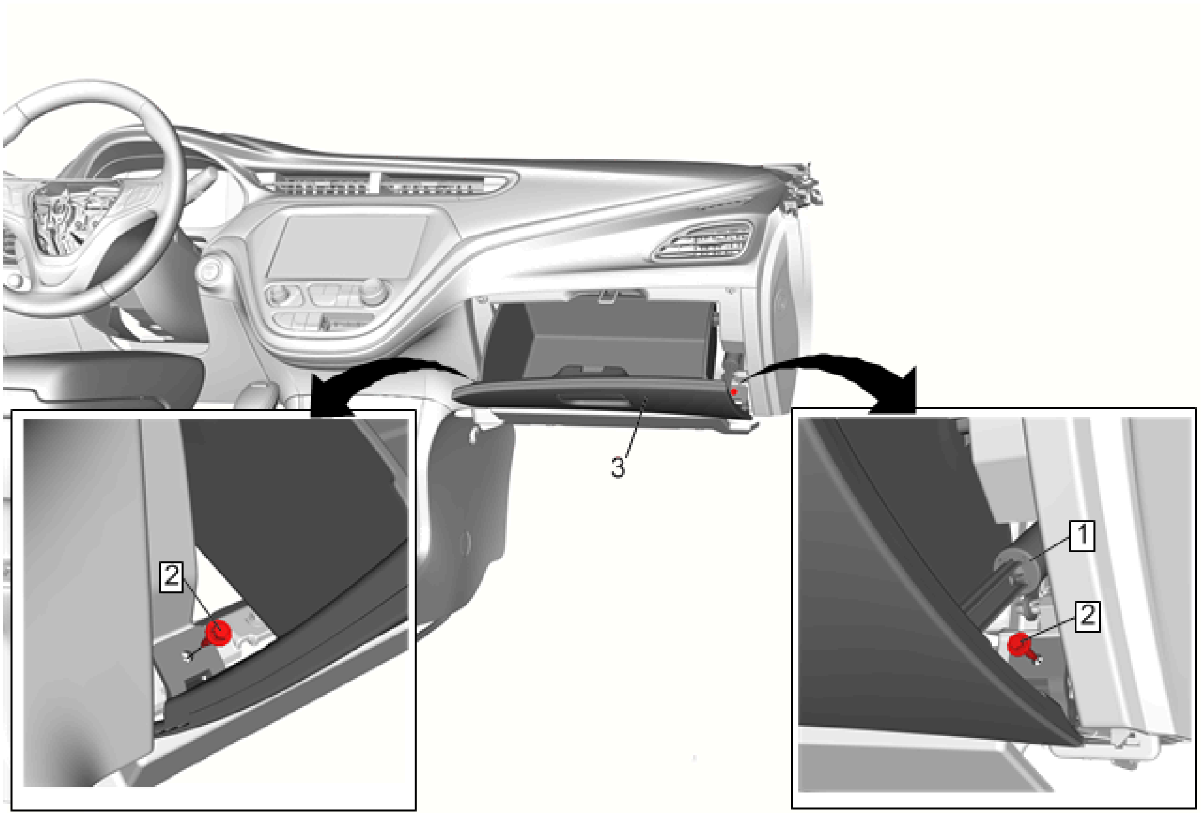

Fig. 13: Instrument Panel Compartment
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Instrument Panel Compartment Door Dampener **Procedure** 1. Open the IP compartment door. 2. Release the door dampener from the IP compartment. 3. Squeeze the sides of the instrument panel compartment allowing the compartment to open past the stops.
2	Instrument Panel Compartment Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
3	Instrument Panel Compartment

INSTRUMENT PANEL TRIM PAD REPLACEMENT - LEFT SIDE

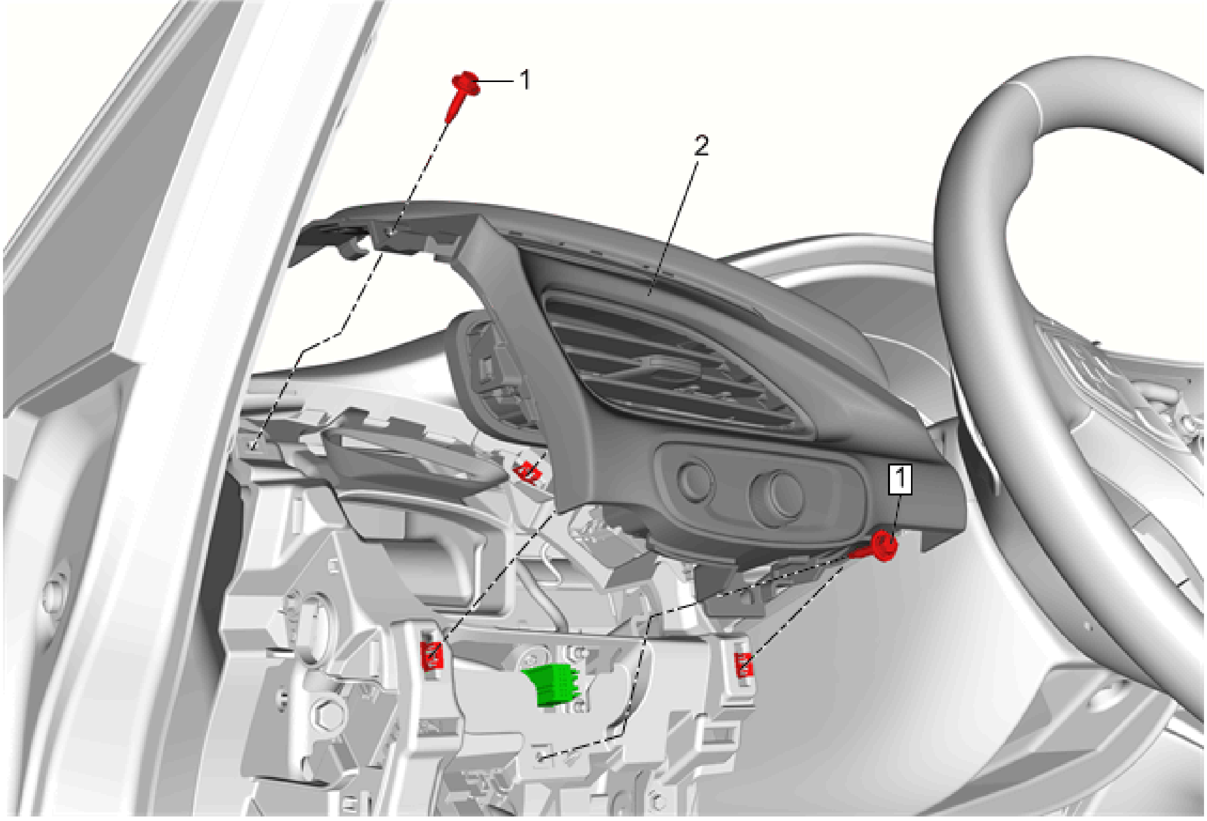

Fig. 14: Instrument Panel Trim Pad - Left Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Instrument Panel Outer Trim Cover Replacement 2. Windshield Garnish Molding Replacement 3. Instrument Panel Knee Bolster Replacement	
1	Instrument Panel Bolt (Qty: 2) **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Instrument Panel Trim Pad - Left Side **Procedure** 1. Use a flat bladed plastic trim tool. 2. Release the plastic retaining tabs. 3. Disconnect the electrical connectors. 4. Remove the headlamp switch. Headlamp Switch Replacement 5. Remove the instrument panel outer air outlet - left side. Instrument Panel Outer Air Outlet Replacement - Left Side 6. Remove the side window defogger outlet grille. Side Window Defogger Outlet Grille Replacement - Left Side

INSTRUMENT PANEL TRIM PAD REPLACEMENT - RIGHT SIDE

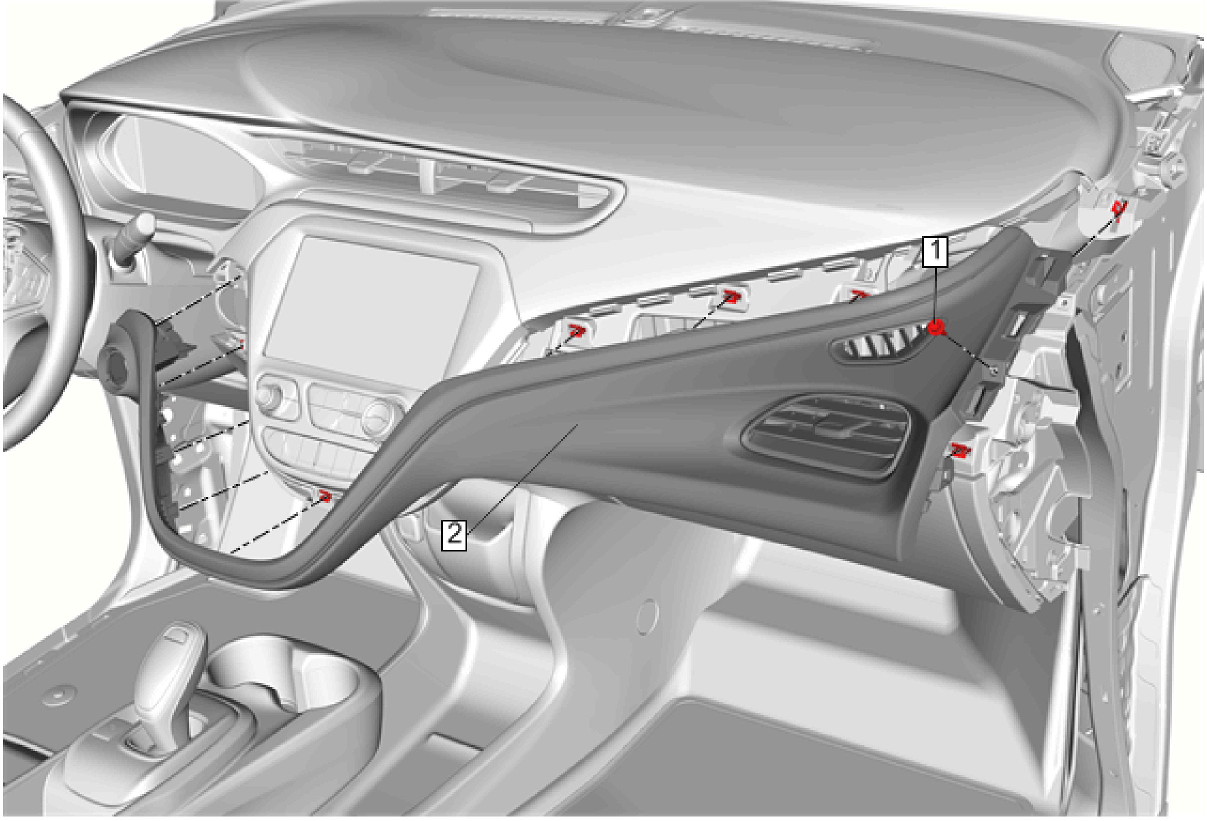

Fig. 15: Instrument Panel Trim Pad - Right Side
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. On/Off Vehicle Switch Replacement 2. Instrument Panel Outer Trim Cover Replacement 3. Windshield Garnish Molding Replacement	
1	Instrument Panel Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Instrument Panel Trim Pad - Right Side **Procedure** 1. Using a flat bladed plastic trim tool, release the plastic retaining tabs. 2. Disconnect the electrical connector. 3. Remove the instrument panel outer air outlet. Instrument Panel Outer Air Outlet Replacement - Right Side 4. Remove the side window defogger outlet grille. Side Window Defogger Outlet Grille Replacement - Right Side

26. Note the location and routing of the instrument panel wiring harness prior to removal to ensure proper installation.
27. Disconnect the wiring harness from the instrument panel carrier.
28. With the aid of an assistant, remove the instrument panel carrier assembly (1) from the vehicle.
29. Transfer components as necessary.

Installation Procedure

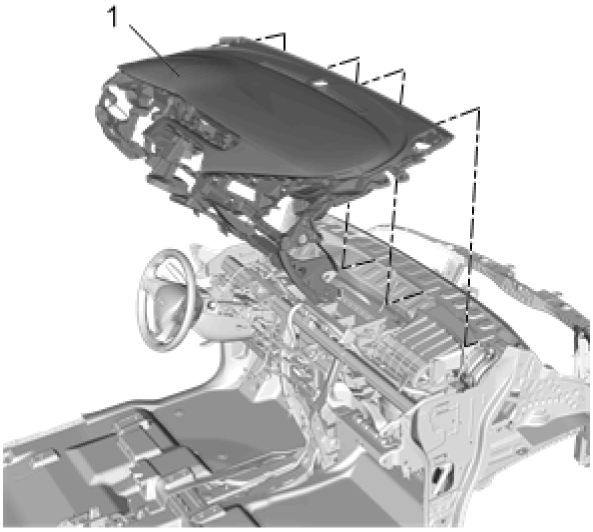

Fig. 39: Instrument Panel Assembly
Courtesy of GENERAL MOTORS COMPANY

1. With the aid of an assistant, position the instrument carrier (1) in the vehicle.
2. Reposition the instrument panel wiring harness into the vehicle position as was noted in the removal and connect the fasteners securing the instrument panel wiring harness to the instrument carrier.

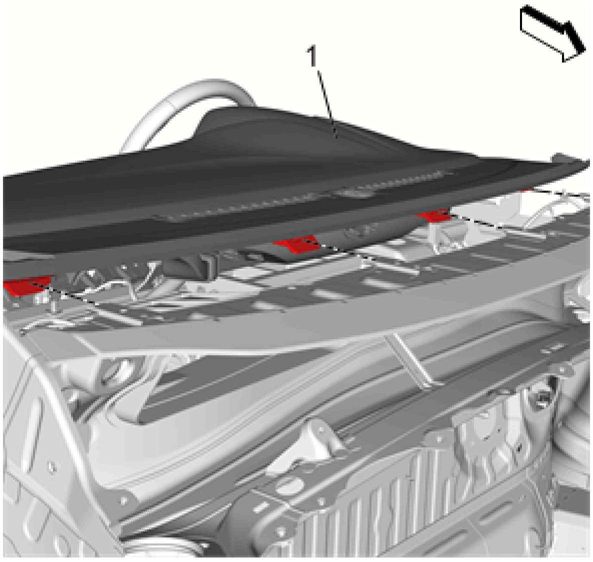

Fig. 40: Instrument Panel Assembly

REPAIR INSTRUCTIONS

FRONT SIDE DOOR ARMREST SWITCH MOUNT PLATE REPLACEMENT

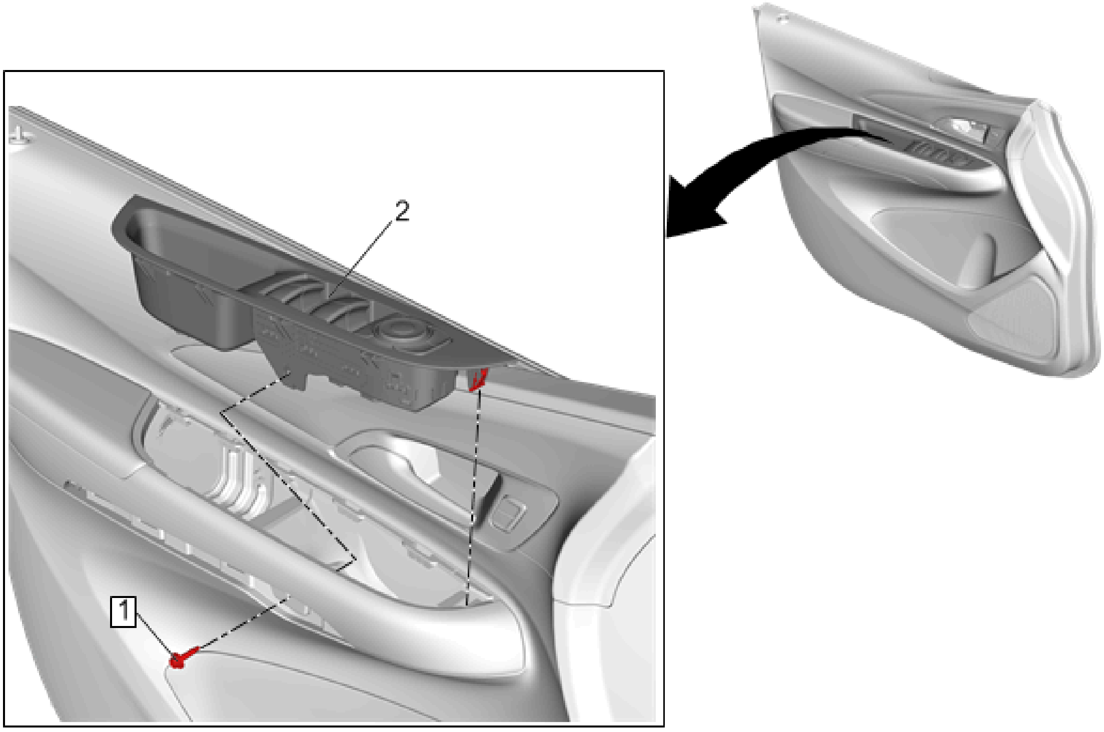

Fig. 1: Front Side Door Armrest Switch Mount Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Front Side Door Trim Panel Applique Replacement 2. Front Side Door Trim Replacement	
1	Front Side Door Armrest Switch Mount Plate Fastener **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Front Side Door Armrest Switch Mount Plate **Procedure** 1. Remove the cloth sound deadening material from the trim. 2. Release the integral retainers from the inside of the door trim. Lift up and outward. 3. Transfer parts as necessary.

FRONT SIDE DOOR UPPER TRIM PANEL REPLACEMENT

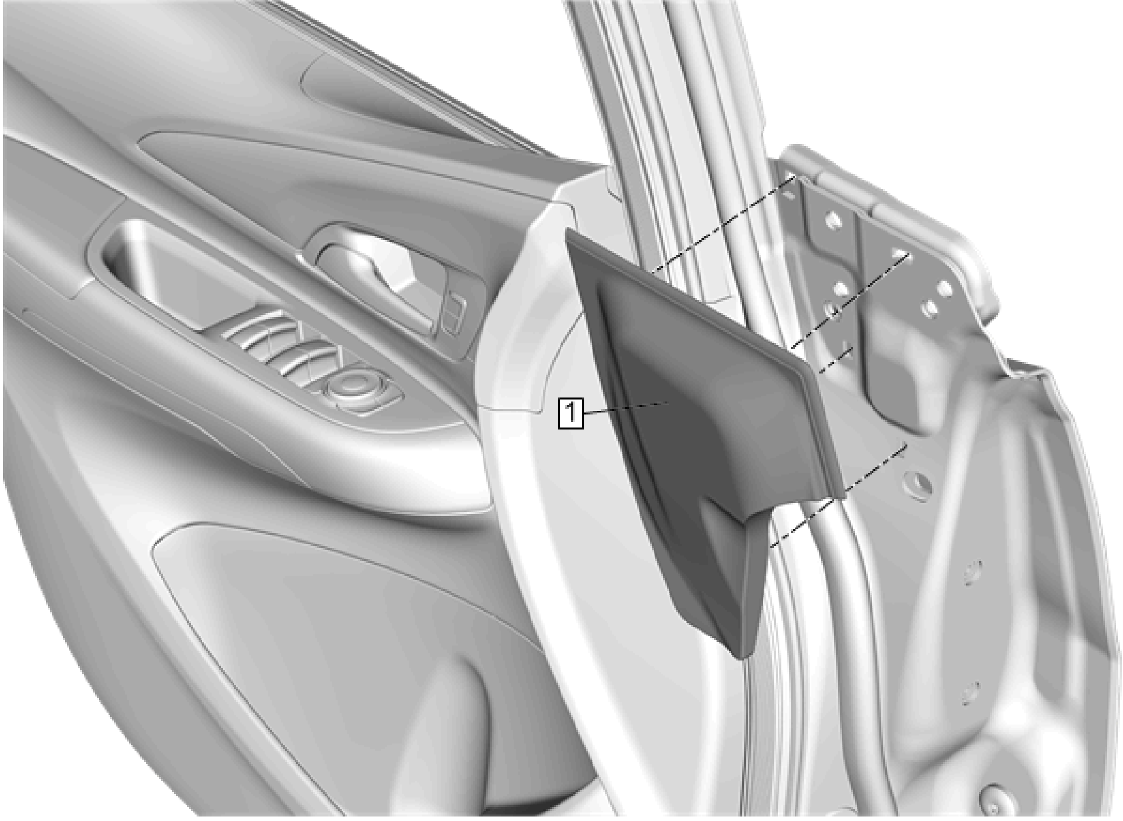

Fig. 2: Front Side Door Upper Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Side Door Upper Trim Panel **Procedure** Pull the door upper trim panel away from the front side door.

FRONT SIDE DOOR TRIM REPLACEMENT

Removal Procedure

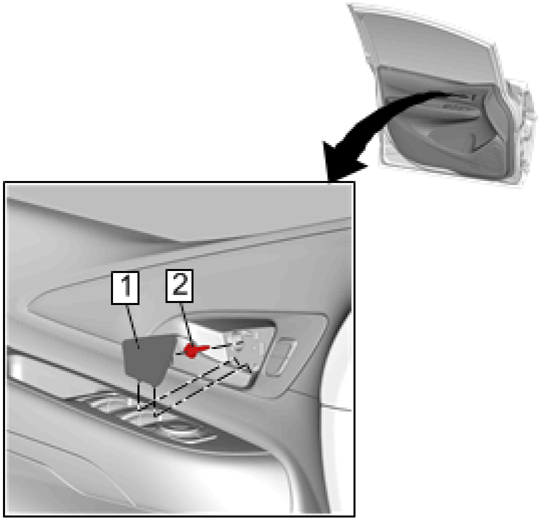

Fig. 3: Front Side Door Inside Handle Fastener Finish Cap
Courtesy of GENERAL MOTORS COMPANY

1. Remove the front side door inside handle fastener finish cap (1).
2. Remove the front side door inside handle fastener (2).

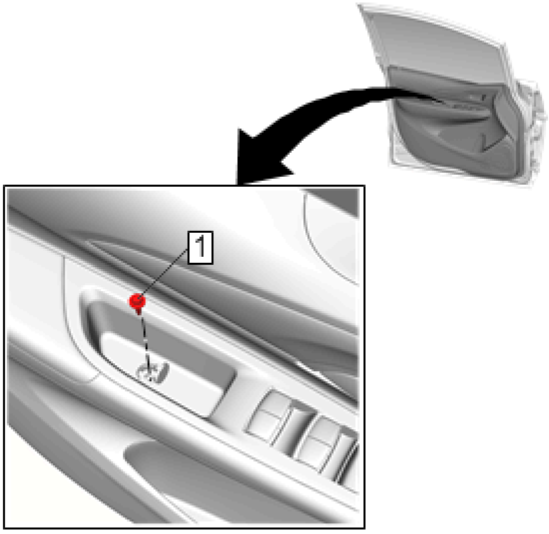

Fig. 4: Front Side Door Armrest Pull Cup Bolt Cap
Courtesy of GENERAL MOTORS COMPANY

3. Use a flat bladed plastic trim tool to release the front side door armrest pull cup bolt cap.
4. Remove the front side door armrest pull cup fastener (1).

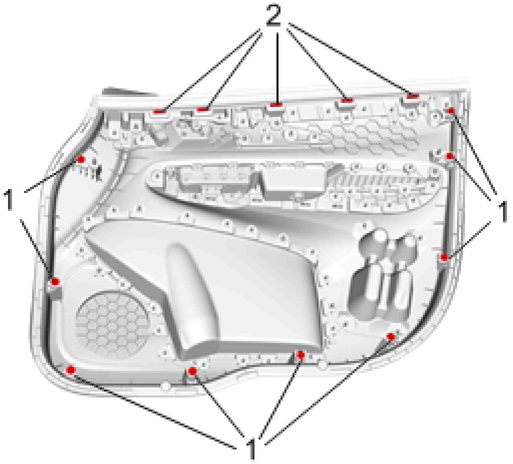

Fig. 5: Door Trim Panel Retainer
Courtesy of GENERAL MOTORS COMPANY

5. Use a appropriate plastic trim tool loosen the retainer (1) (Qty: 9) along the bottom of the door trim panel.
6. When the panel is sufficiently loosened, grasp with both hands and lift up and release the belt line clip (2) (Qty: 5) with the belt molding.
7. Disconnect the door lock retainer cable from the door trim panel and the inside handle.
8. Disconnect the electrical connector.

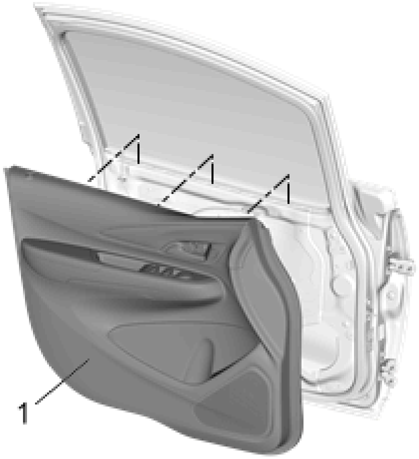

Fig. 6: Front Side Door Trim
Courtesy of GENERAL MOTORS COMPANY

9. Remove the front side door trim (1).
10. Place the door trim panel on a clean flat surface.
11. Release the belt molding and belt line clips from the door trim panel.

Installation Procedure

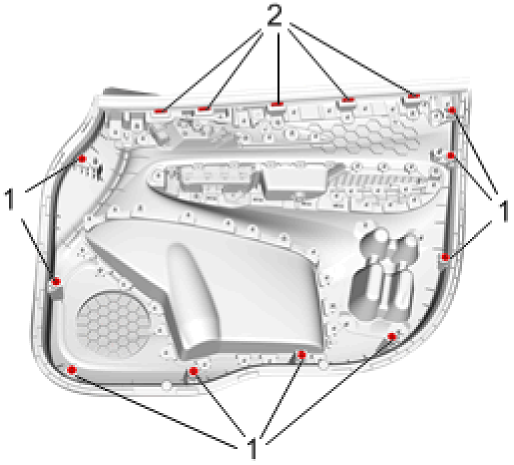

Fig. 7: Door Trim Panel Retainer
Courtesy of GENERAL MOTORS COMPANY

1. Make sure the belt line clip (2) (Qty: 5) are replaced with new clips before re-attaching the door trim, even if they weren't damaged.
2. Install the belt molding to the front side door trim assembly.
3. The retainer (1) (Qty: 9) that are destroyed during removal must be replaced with new retainers to properly reattach the door trim.

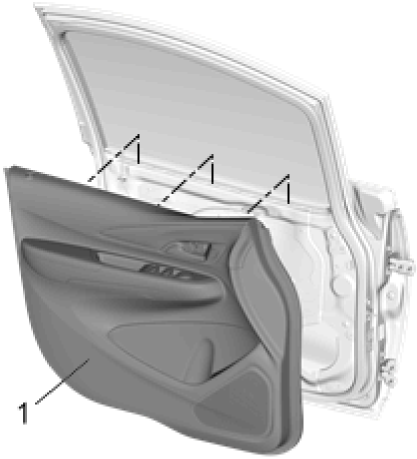

Fig. 8: Front Side Door Trim
Courtesy of GENERAL MOTORS COMPANY

4. Connect the electrical connector.
5. Connect the door lock retainer cable to the door trim panel and the inside handle.
6. Install the front side door trim (1)

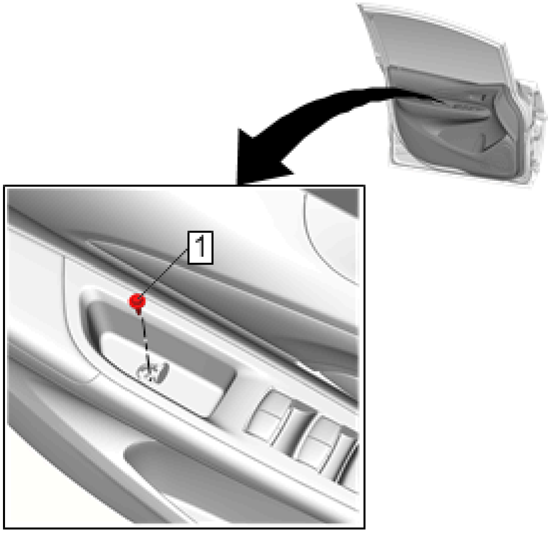

Fig. 9: Front Side Door Armrest Pull Cup Bolt Cap
Courtesy of GENERAL MOTORS COMPANY

7. Front Side Door Armrest Pull Cup Fastener (1) - Install and tighten to 2.5 N.m (22 lb in)
8. Install the front side door armrest pull cup fastener cap.

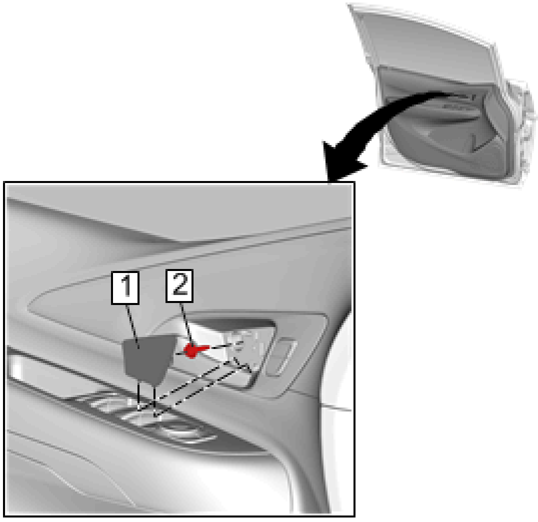

Fig. 10: Front Side Door Inside Handle Fastener Finish Cap
Courtesy of GENERAL MOTORS COMPANY

9. Front Side Door Inside Handle Fastener (2) - Install and tighten to 2.5 N.m (22 lb in)
10. Install the front side door inside handle fastener finish cap (1).

FRONT SIDE DOOR TRIM PANEL APPLIQUE REPLACEMENT

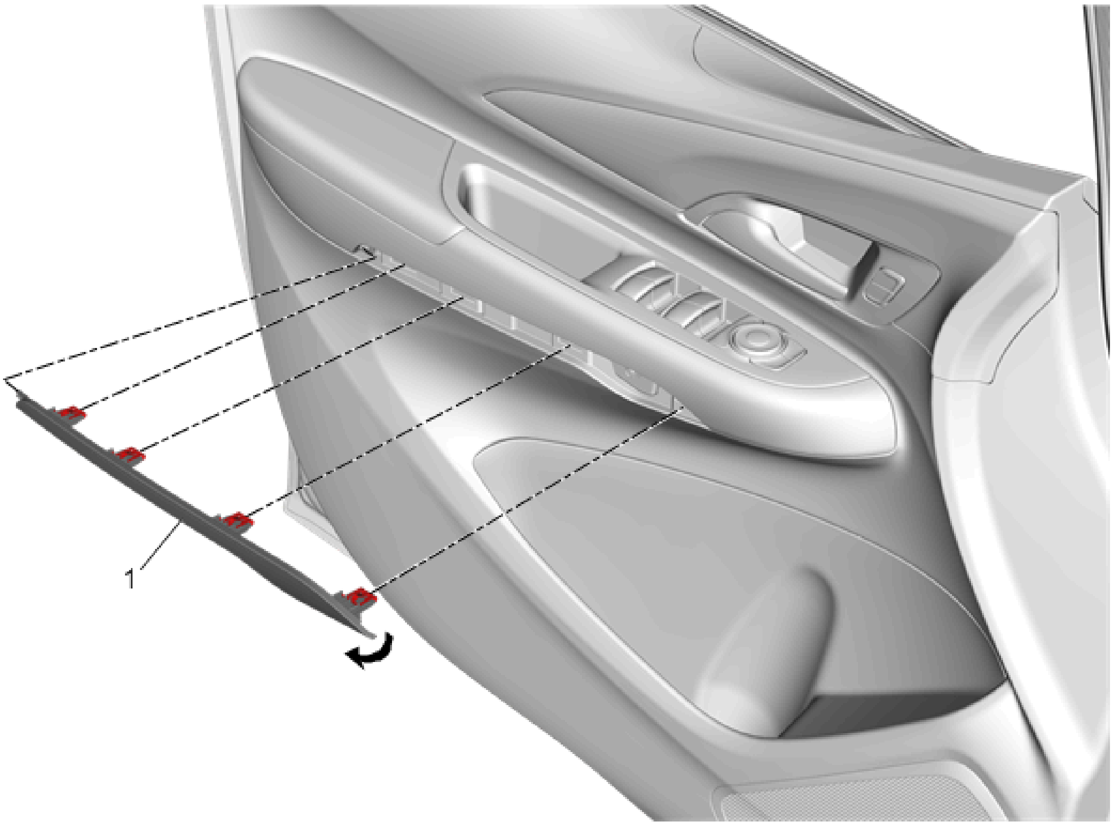

Fig. 11: Front Side Door Trim Panel Applique
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Front Side Door Trim Panel Applique **Procedure** 1. Using a flat-bladed plastic trim tool, gently lift the front side door trim panel applique from the door trim panel, starting from the forward edge. 2. Pull the rear edge of the front side door trim panel applique forward to disengage from the door trim panel.

REAR SIDE DOOR UPPER REAR TRIM PANEL REPLACEMENT

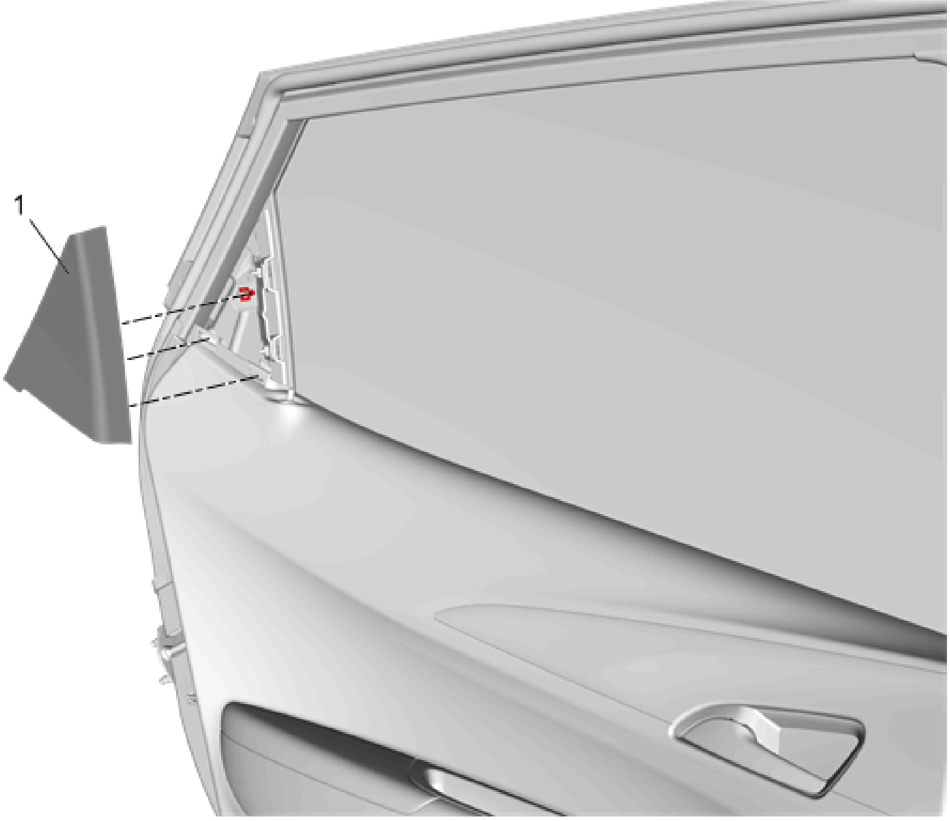

Fig. 12: Rear Side Door Upper Rear Trim Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Rear Side Door Upper Rear Trim Panel **Procedure** Pull the door upper rear trim panel away from the rear side door.

FRONT SIDE DOOR WATER DEFLECTOR REPLACEMENT

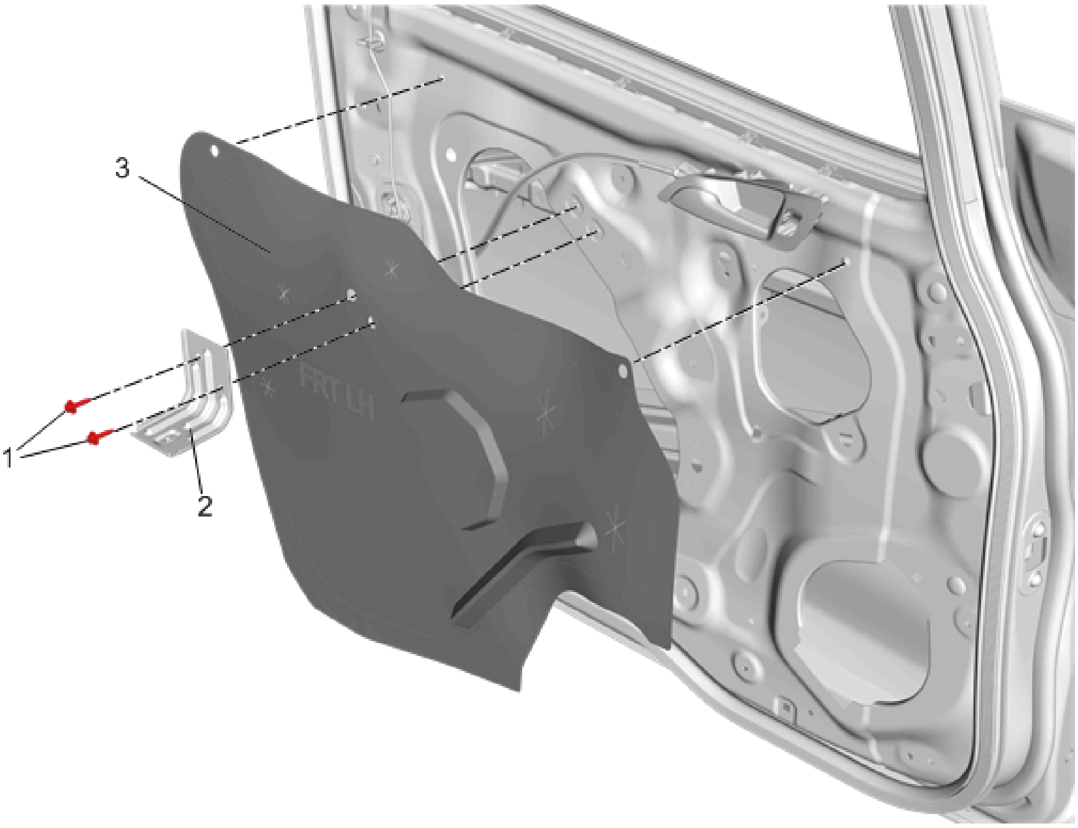

Fig. 13: Front Side Door Water Deflector
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
Preliminary Procedure Remove the front side door trim panel. Front Side Door Trim Replacement	
1	Front Side Door Armrest Bracket Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Front Side Door Armrest Bracket
3	Front Side Door Water Deflector **Procedure** Disconnect, unclip and guide the electrical connectors and door lock cable through the water deflector while removing it from the door. **NOTE:** **Make sure that the front side door water deflector is leakproof.**

REAR SIDE DOOR WATER DEFLECTOR REPLACEMENT

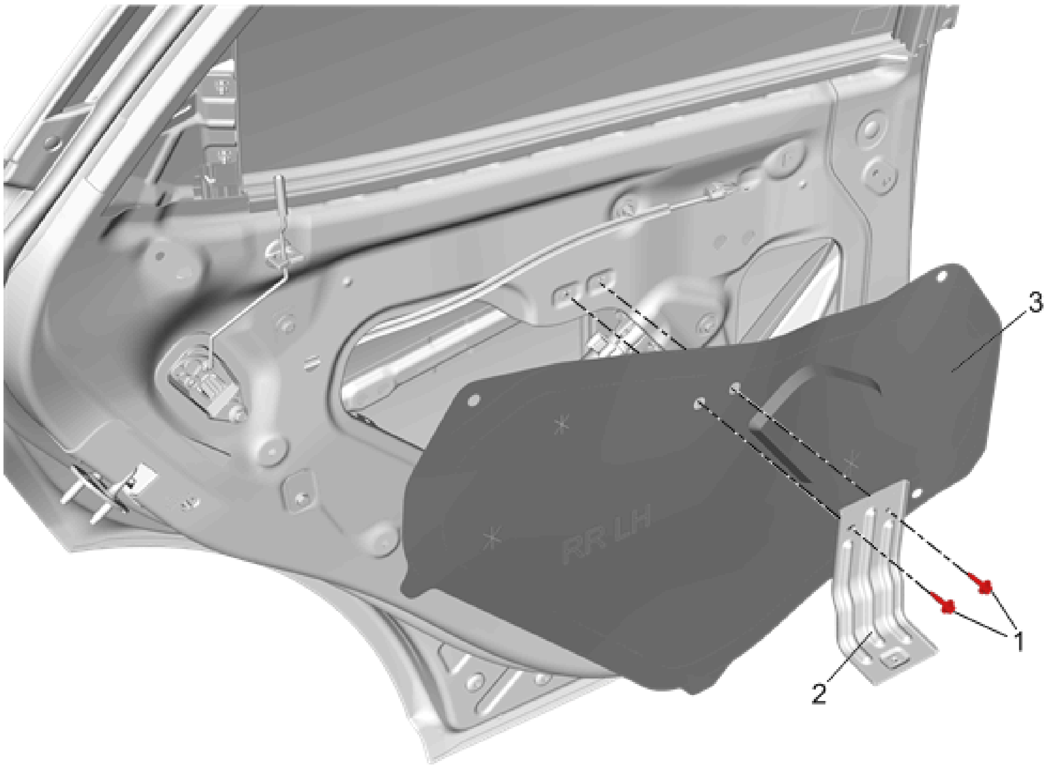

Fig. 14: Rear Side Door Water Deflector
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the rear side door trim panel. Rear Side Door Trim Replacement	

Callout	Component Name
1	Rear Side Door Armrest Bracket Bolt **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Rear Side Door Armrest Bracket
3	Rear Side Door Water Deflector **Procedure** Disconnect, unclip and guide the electrical connectors and door lock cable through the water deflector while removing it from the door. **NOTE:** **Secure that the rear side door water deflector is leakproof.**

REAR SIDE DOOR ARMREST SWITCH MOUNT PLATE REPLACEMENT

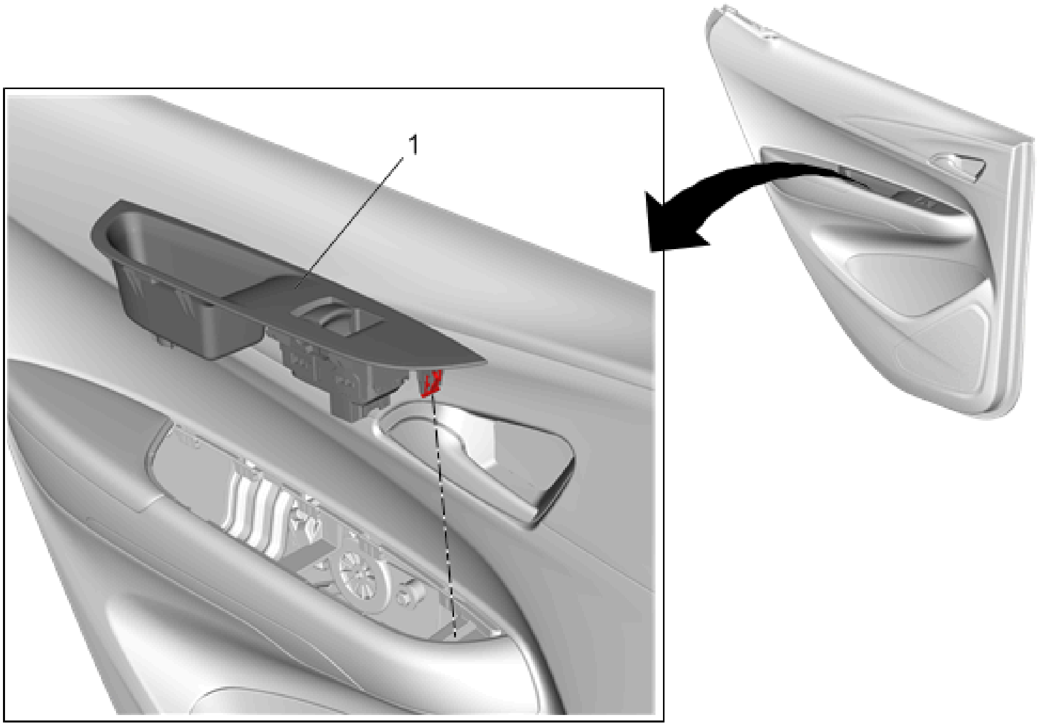

Fig. 15: Rear Side Door Armrest Switch Mount Plate
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Side Door Trim Replacement	
1	Rear Side Door Armrest Switch Mount Plate **Procedure** 1. Remove the cloth sound deadening material from the trim panel. 2. Release the integral retainers from the inside of the door trim. Lift up and outward. 3. Transfer components as necessary.

FRONT SIDE DOOR SILL GARNISH MOLDING REPLACEMENT

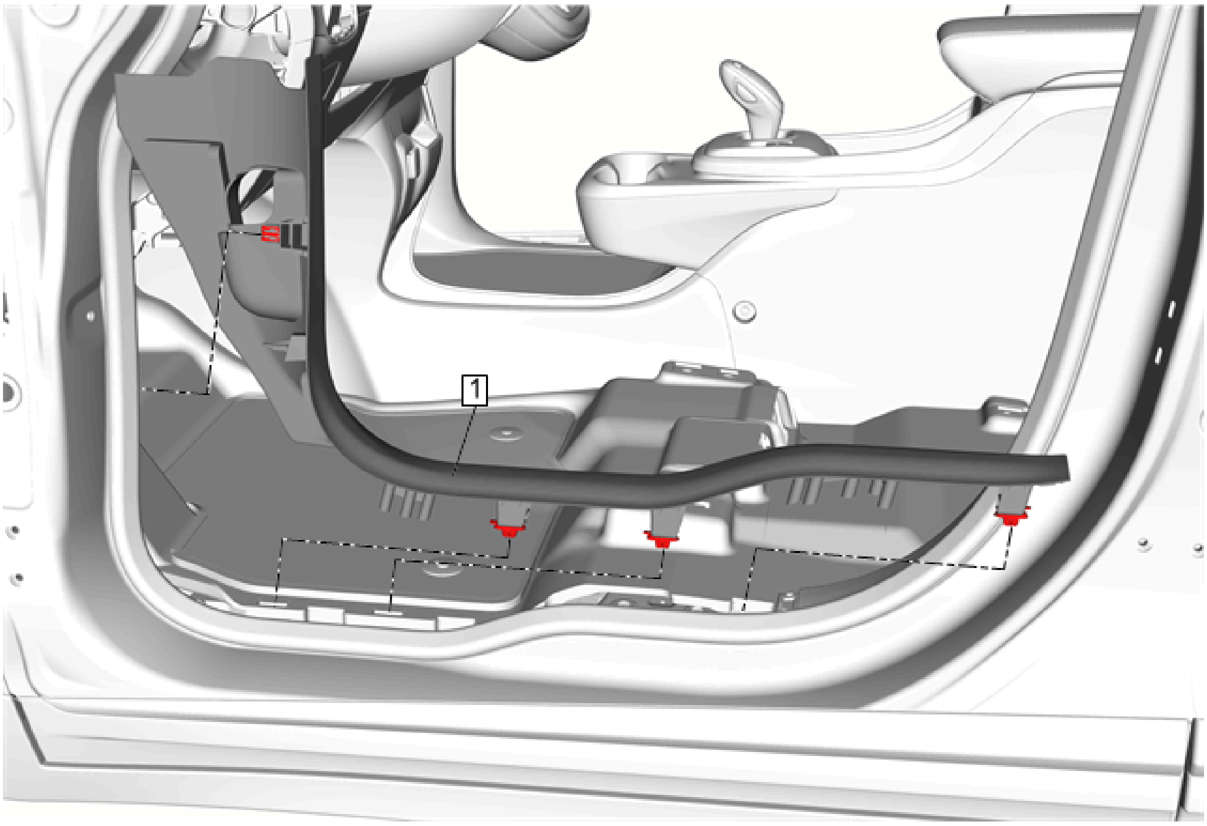

Fig. 16: Front Side Door Sill Garnish Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure 1. **Instrument Panel Outer Trim Cover Replacement** 2. When replacing the driver side front side door sill garnish molding, remove the hood primary latch release cable handle. **Hood Primary Latch Release Cable Handle Replacement**	
1	Front Side Door Sill Garnish Molding **Procedure** 1. Starting at the rear of the garnish molding, pull upward at the B-Pillar joint to disengage garnish molding. 2. Work your way forward disengaging all of the garnish molding clips then pull rearward to disengage the clip on the forward vertical wall. 3. Reposition the door weatherstrip as needed. 4. Replace the retainers as required.

REAR SIDE DOOR SILL GARNISH MOLDING REPLACEMENT

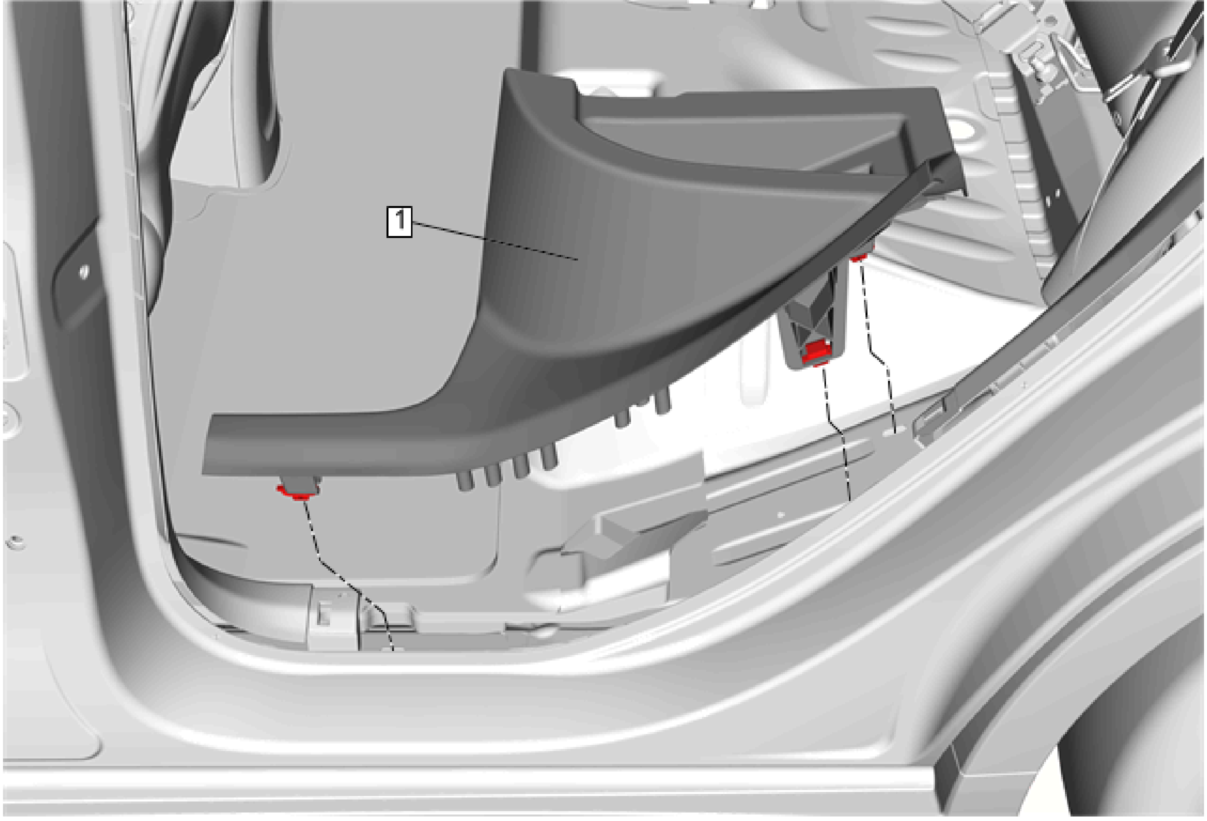

Fig. 17: Rear Side Door Sill Garnish Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Rear Seat Cushion Removal and Installation	
1	Rear Side Door Sill Garnish Molding **Procedure** 1. Starting at the front of the sill garnish molding, pull upward at the B-Pillar joint to disengage sill garnish molding. 2. Work your way rearward disengaging all of the garnish molding clips then pull forward to disengage from the C-Pillar lower. 3. Replace the retainers as required.

ROOF RAIL ASSIST HANDLE REPLACEMENT

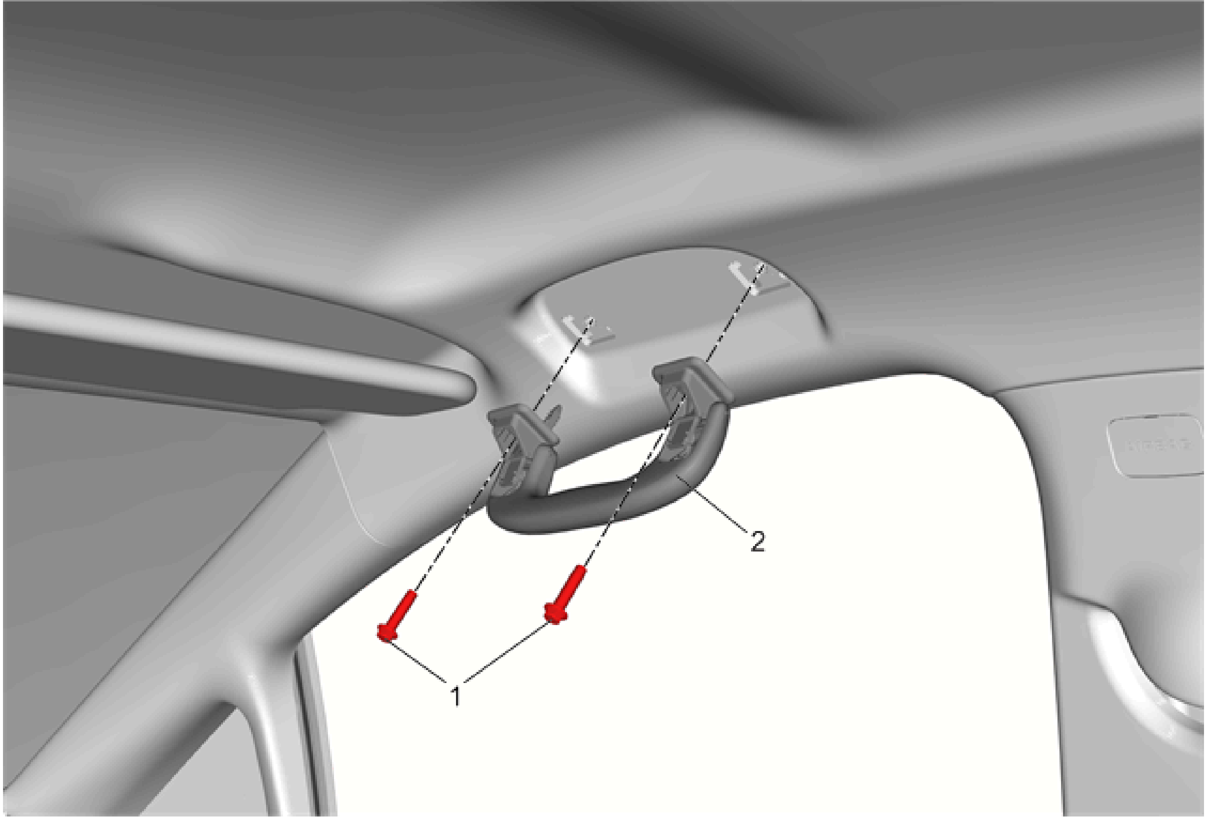

Fig. 18: Roof Rail Assist Handle
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Roof Rail Assist Handle Fastener **CAUTION:** **Refer to Fastener Caution .** **Procedure** 1. Fold the roof rail assist handle downward and hold. 2. Use a small flat-bladed tool to open the roof rail assist handle covers to access the bolt. **Tighten** 6 N.m (53 lb in)
2	Roof Rail Assist Handle

COAT HOOK REPLACEMENT

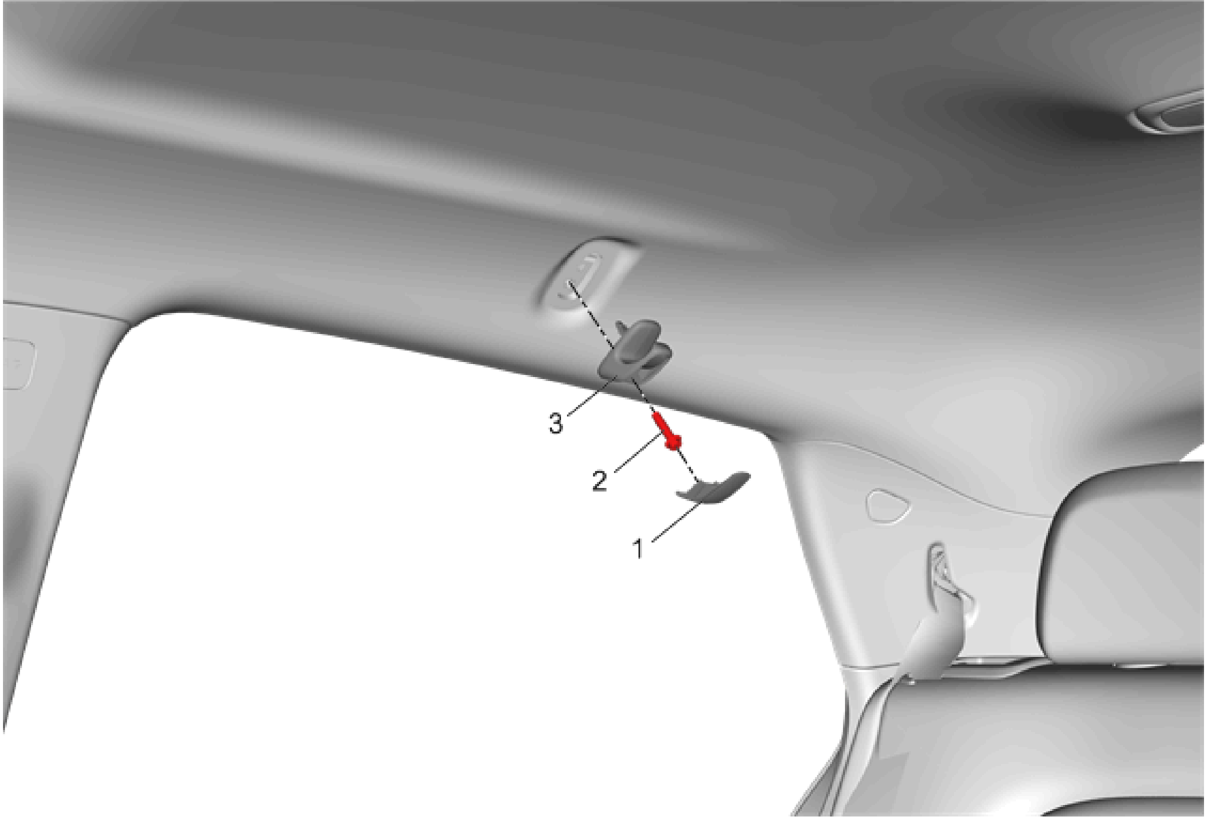

Fig. 19: Coat Hook
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Coat Hook Cover
2	Coat Hook Bolt **CAUTION:** **Refer to Fastener Caution .** **Procedure** Use a small flat-bladed tool to open the coat hook cover for access to the bolt. **Tighten** 6 N.m (53 lb in)
3	Coat Hook

SUNSHADE REPLACEMENT

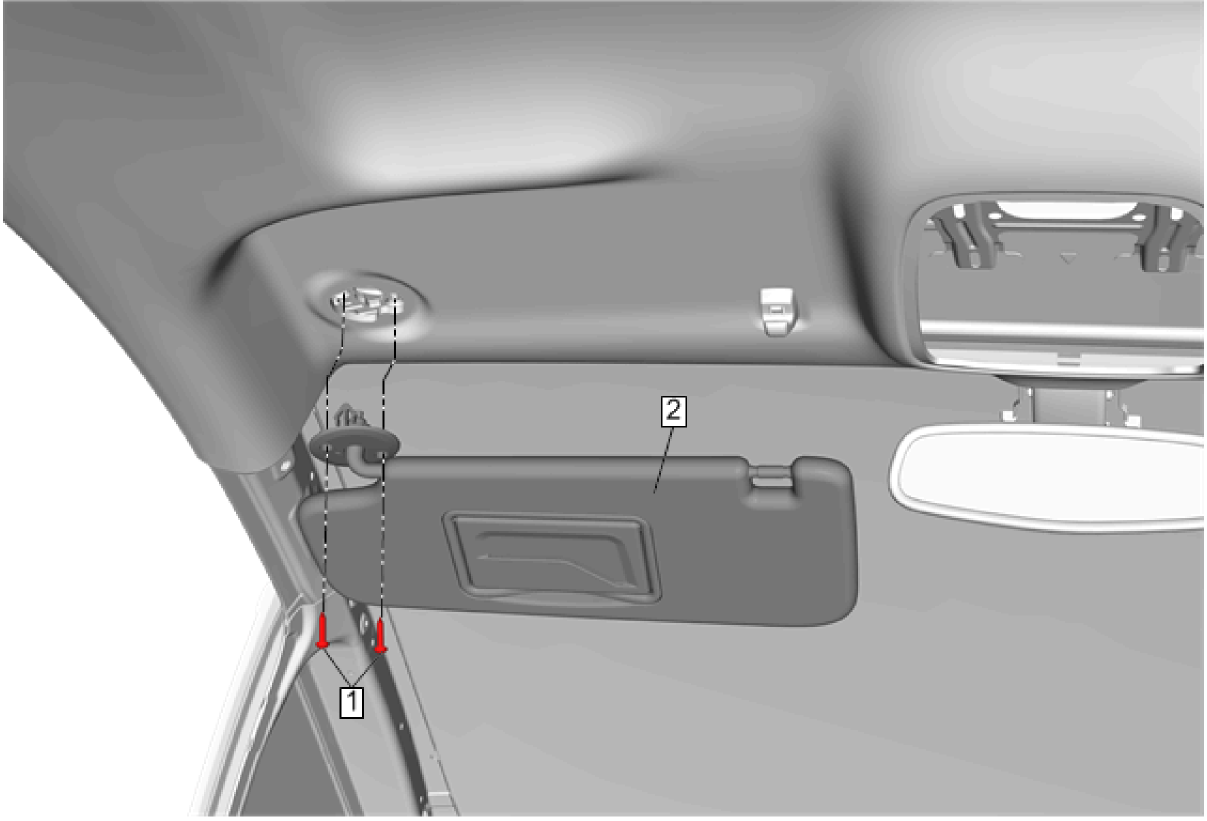

Fig. 20: Sunshade
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Sunshade Fastener **CAUTION:** **Refer to Fastener Caution .** **Tighten** 2.5 N.m (22 lb in)
2	Sunshade **Procedure** 1. Lower the front portion of the headliner to access the sunshade electrical connector and sunshade retainer. **Headlining Trim Panel Replacement** 2. Squeeze the tabs at the base of the sunshade assembly to detach it from the roof panel and allow the headliner with the sunshade attached to be lowered. 3. Release the retainer attaching the sunshade to the headliner assembly.

SUNSHADE SUPPORT REPLACEMENT

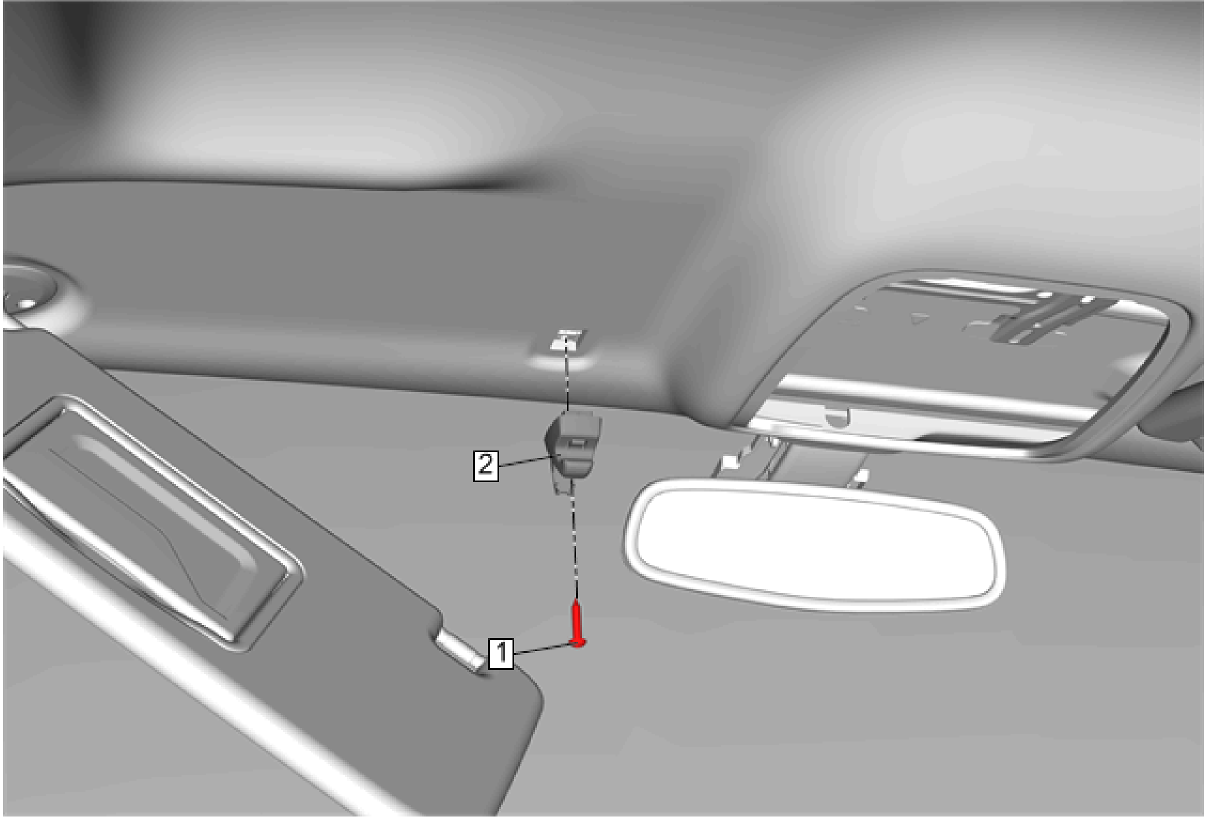

Fig. 21: Sunshade Support
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Sunshade Support Screw **CAUTION:** **Refer to Fastener Caution .** **Procedure** Open the sunshade support screw access cover with a appropriate tool. **Tighten** 2.5 N.m (22 lb in)
2	Sunshade Support **Procedure** Unclip the sunshade from the support and reposition.

WINDSHIELD GARNISH MOLDING REPLACEMENT

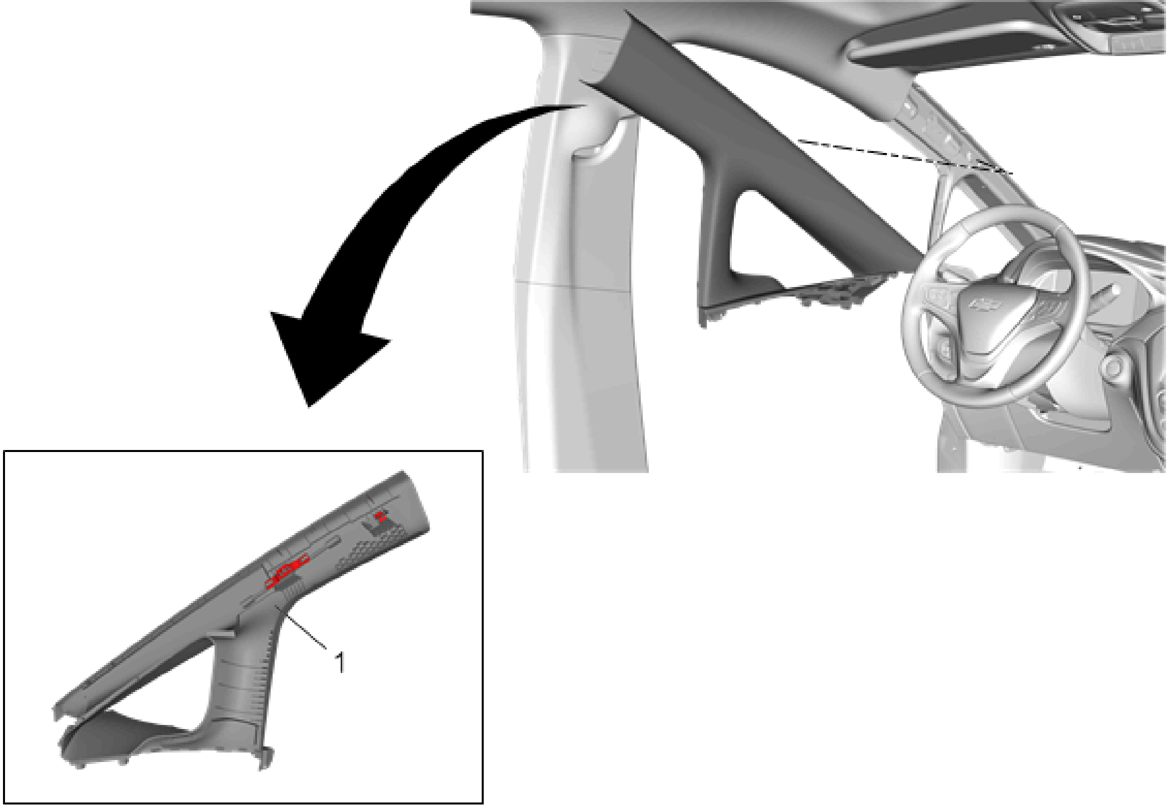

Fig. 22: Windshield Garnish Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
CAUTION: **If a vehicle is equipped with a head curtain inflator module ensure that the inflator module and tether are undamaged. If tether or curtain airbag are damaged in any way, they must be replaced.** **CAUTION:** **Use care when working around the head curtain inflator module. Sharp tools may puncture the curtain airbag. If the head curtain inflator module is damaged in any way, it must be replaced.** **Preliminary Procedure** Disable the SIR system. SIR Disabling and Enabling	
1	Windshield Garnish Molding **Procedure** 1. Pull the top of the A-Pillar inward to disengage the upper clip. 2. Carefully remove the tether from the garnish molding. 3. Pull upward to disengage from the instrument panel. 4. The tether clip at the center portion of the garnish molding MUST be replaced every time the windshield garnish molding is removed. 5. Enable the SIR system. SIR Disabling and Enabling

CENTER PILLAR UPPER TRIM PANEL REPLACEMENT

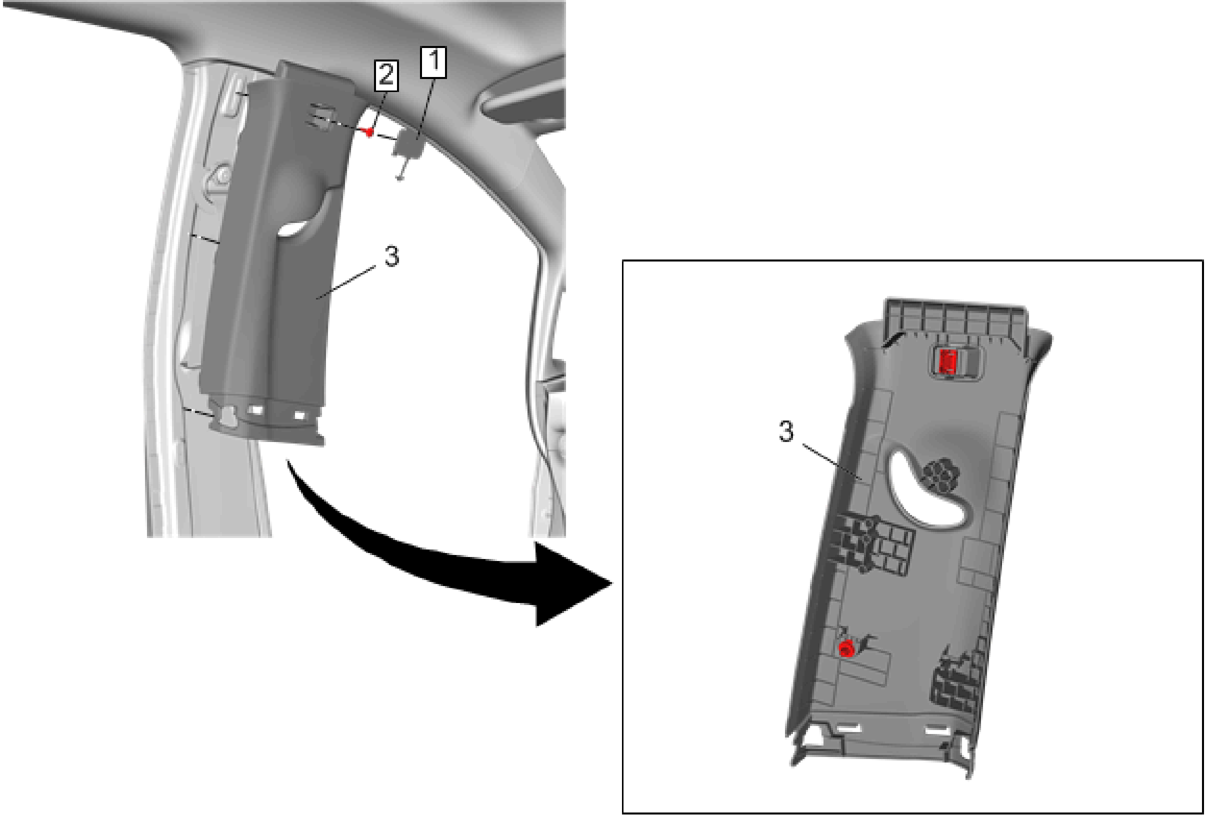

Fig. 23: Center Pillar Upper Trim Panel

2. Remove the rear side door inside handle fastener finish cap (1).
3. Remove the rear side door inside handle fastener (2).

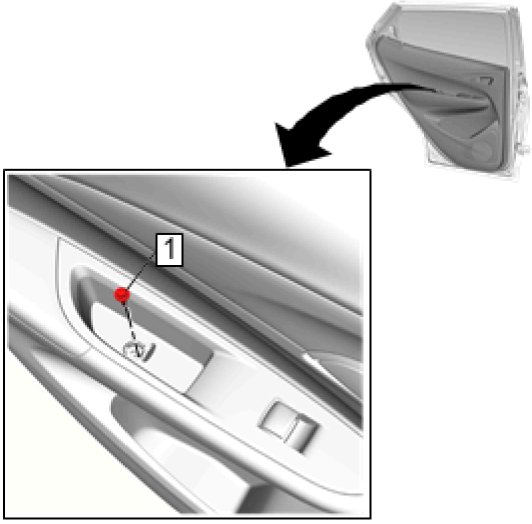

Fig. 50: Rear Side Door Armrest Pull Cup Fastener Cap
Courtesy of GENERAL MOTORS COMPANY

4. Use a flat bladed plastic trim tool to release the rear side door armrest pull cup fastener cap.
5. Remove the rear side door armrest pull cup fastener (1).

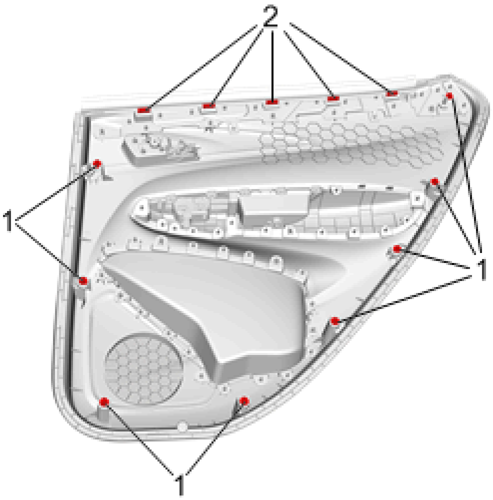

Fig. 51: Door Trim Panel Retainer
Courtesy of GENERAL MOTORS COMPANY

6. Use a appropriate plastic trim tool loosen the retainer (1) (Qty: 8) along the bottom of the door trim panel.
7. When the panel is sufficiently loosened, grasp with both hands and lift up and release the belt line clip (2) (Qty: 5) with the belt molding.
8. Disconnect the door lock retainer cable from the door trim panel and the inside handle.
9. Disconnect the electrical connector.

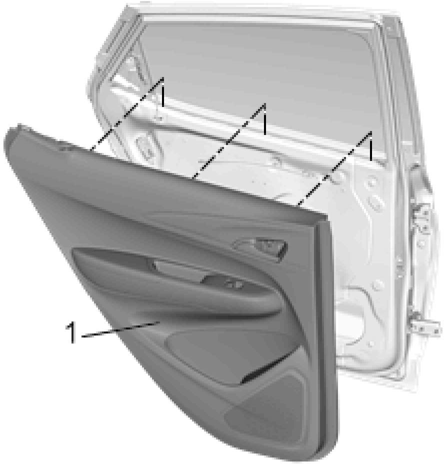

Fig. 52: Rear Side Door Trim
Courtesy of GENERAL MOTORS COMPANY

10. Remove the rear side door trim (1).
11. Place the door trim panel on a clean flat surface.
12. Release the belt molding and belt line clips from the door trim panel.

Installation Procedure

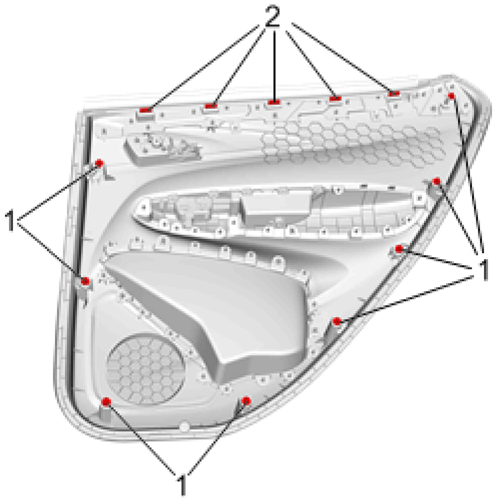

Fig. 53: Door Trim Panel Retainer
Courtesy of GENERAL MOTORS COMPANY

1. Make sure the belt line clip (2) (Qty: 5) are replaced with new clips before re-attaching the door trim, even if they weren't damaged.
2. Install the belt molding to the rear side door trim assembly.
3. The retainer (1) (Qty: 8) that are destroyed during removal must be replaced with new retainers to properly reattach the door trim.

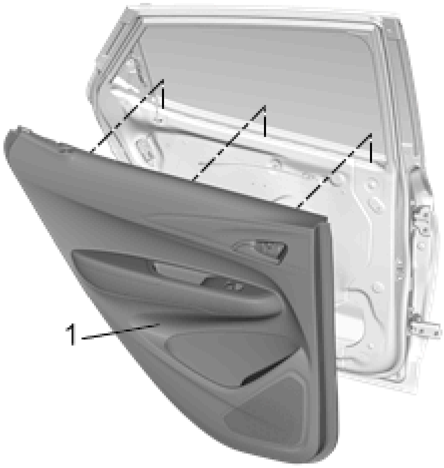

Fig. 54: Rear Side Door Trim
Courtesy of GENERAL MOTORS COMPANY

4. Connect the electrical connector.
5. Connect the door lock retainer cable to the door trim panel and the inside handle.
6. Install the rear side door trim (1)

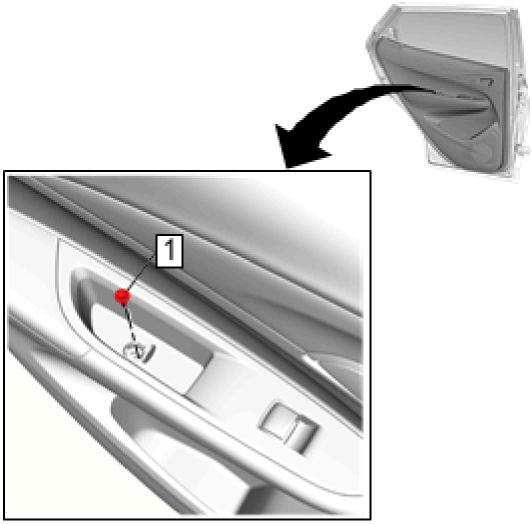

Fig. 55: Rear Side Door Armrest Pull Cup Fastener Cap
Courtesy of GENERAL MOTORS COMPANY

7. Rear Side Door Armrest Pull Cup Fastener (1) - Install and tighten to 2.5 N.m (22 lb in)
8. Install the rear side door armrest pull cup fastener cap.

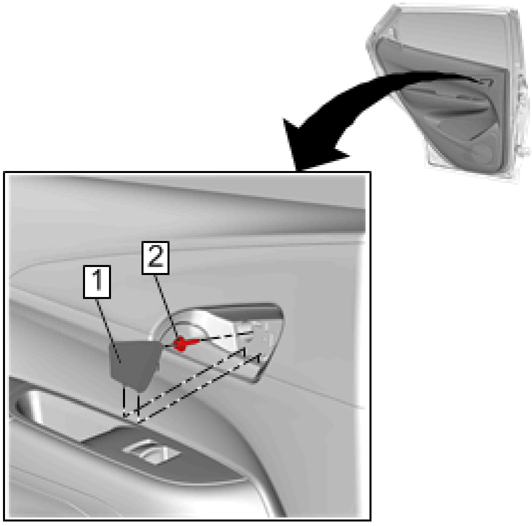

Fig. 56: Rear Side Door Inside Handle Fastener Finish Cap
Courtesy of GENERAL MOTORS COMPANY

9. Rear Side Door Inside Handle Fastener (2) - Install and tighten to 2.5 N.m (22 lb in)
10. Install the rear side door inside handle fastener finish cap (1).

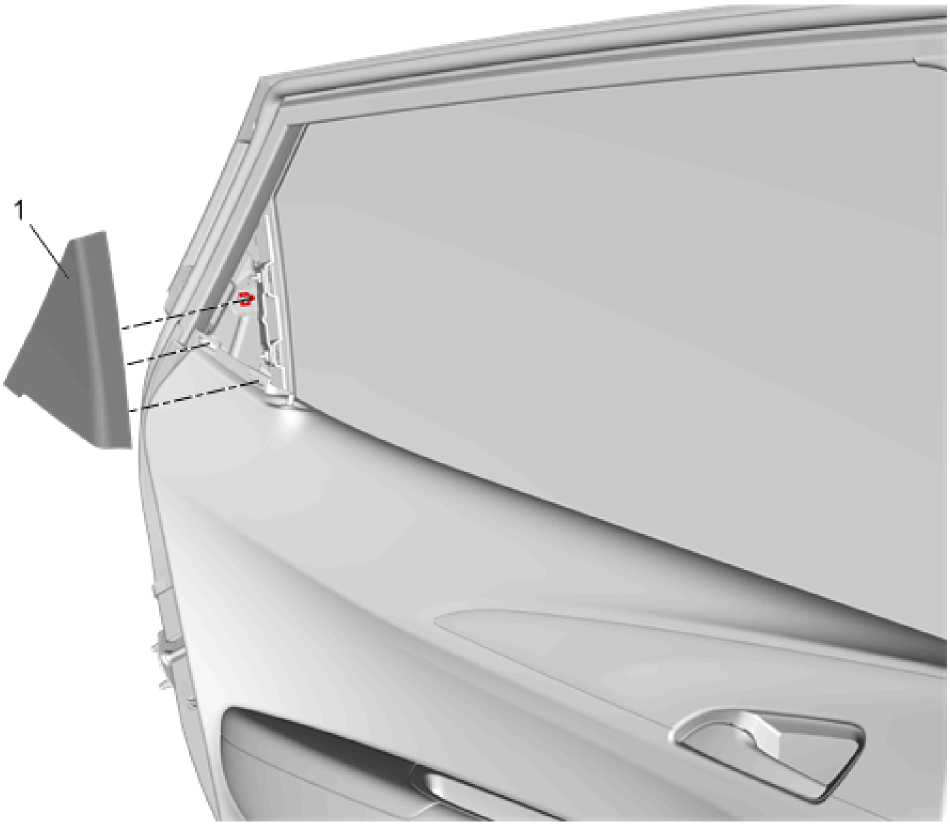

Fig. 57: Rear Side Door Upper Rear Trim Panel

11. Install the rear side door upper rear trim panel. Rear Side Door Upper Rear Trim Panel Replacement

LUGGAGE SHADE REPLACEMENT

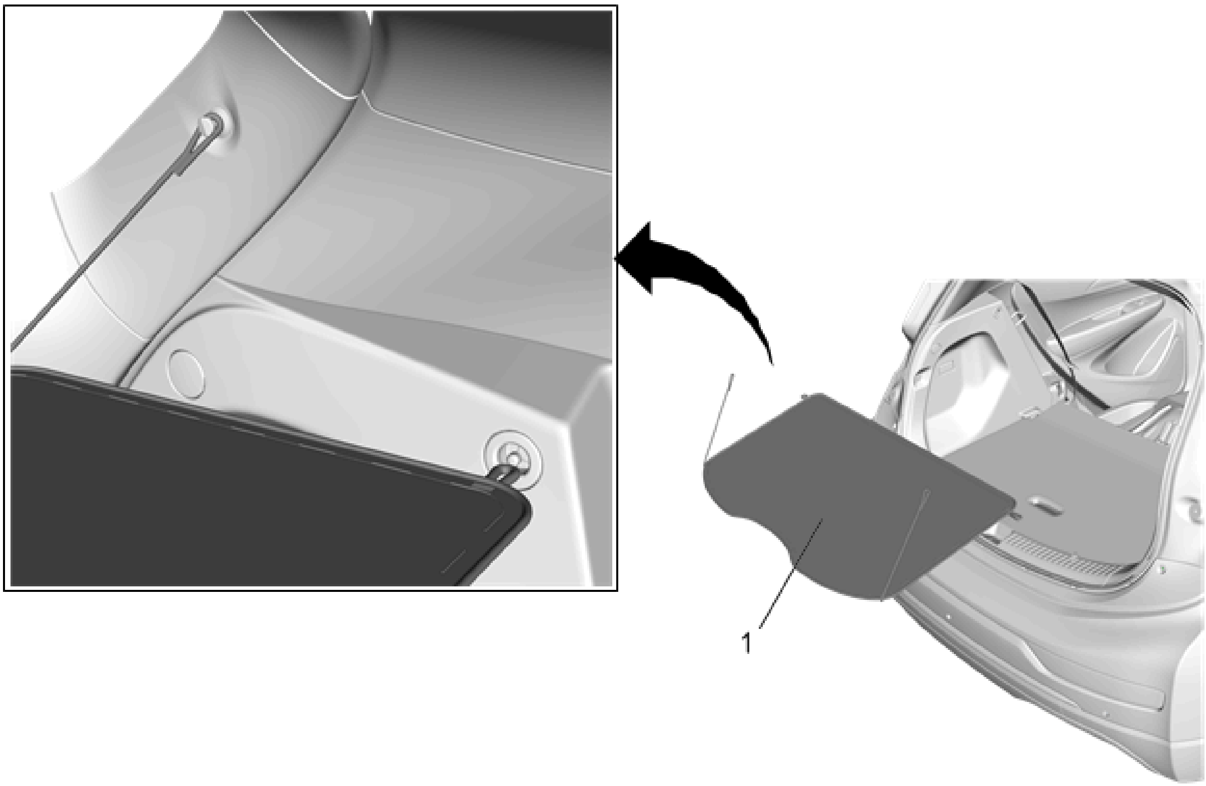

Fig. 58: Luggage Shade
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Luggage Shade **Procedure** Release the luggage shade straps from the cargo screen retainers.

LUGGAGE SHADE PIVOT REPLACEMENT

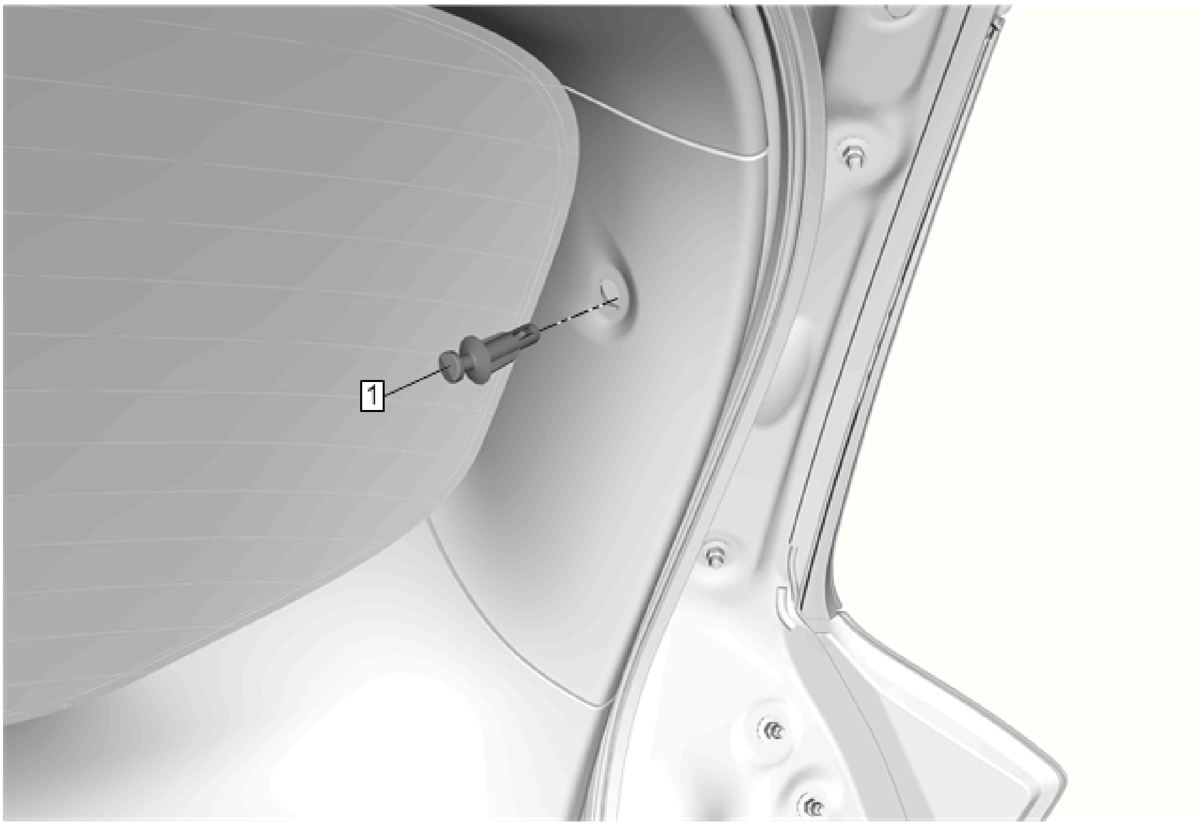

Fig. 59: Luggage Shade Pivot
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
1	Luggage Shade Pivot **Procedure** Release the luggage shade strap. **NOTE:** **The luggage shade pivots are a one-time use component and will break upon removal.**

LIFTGATE SILL GARNISH MOLDING REPLACEMENT

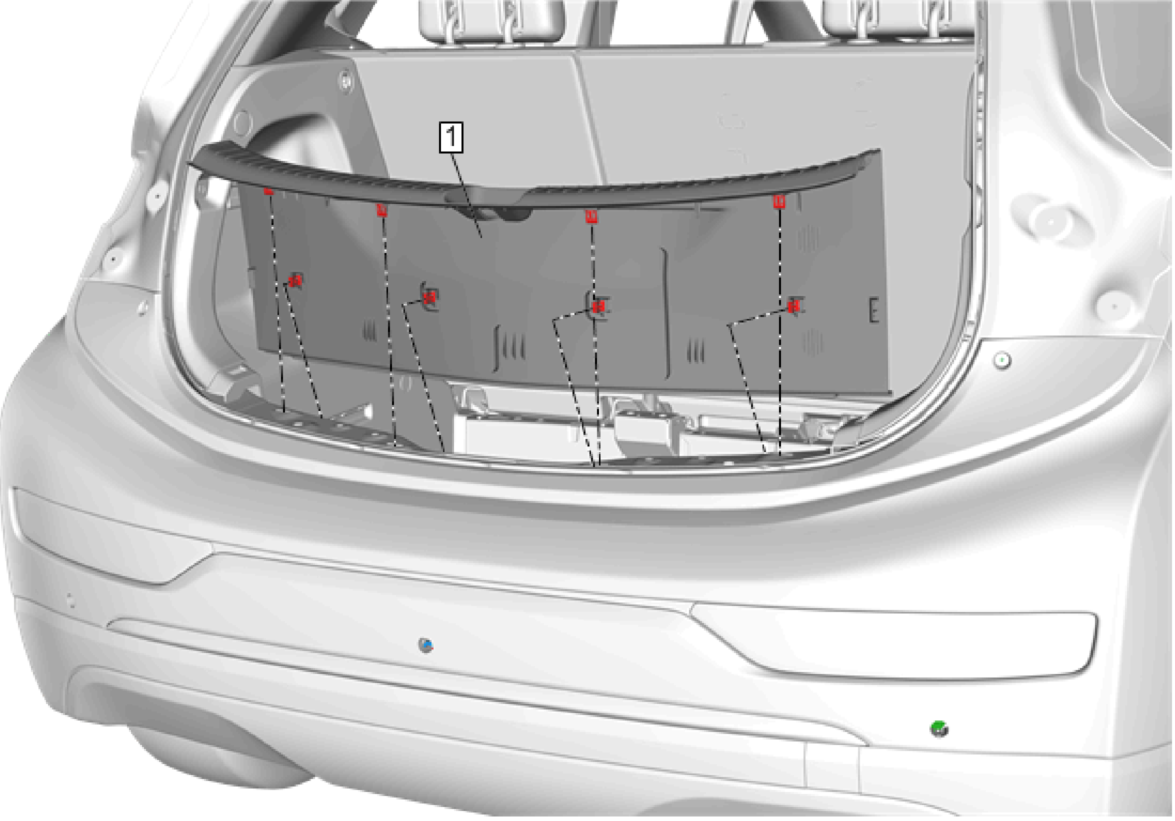

Fig. 60: Liftgate Sill Garnish Molding
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedures 1. Rear Compartment Stowage Shelf Replacement 2. Load Floor Trim Panel Replacement	
1	Liftgate Sill Garnish Molding **Procedure** Grasp and gently pull inward on the bottom of the panel to release the lower retainers and then up on the rear end trim finish panel in order to release the integral retaining clips.

LIFTGATE UPPER CENTER TRIM FINISH PANEL REPLACEMENT

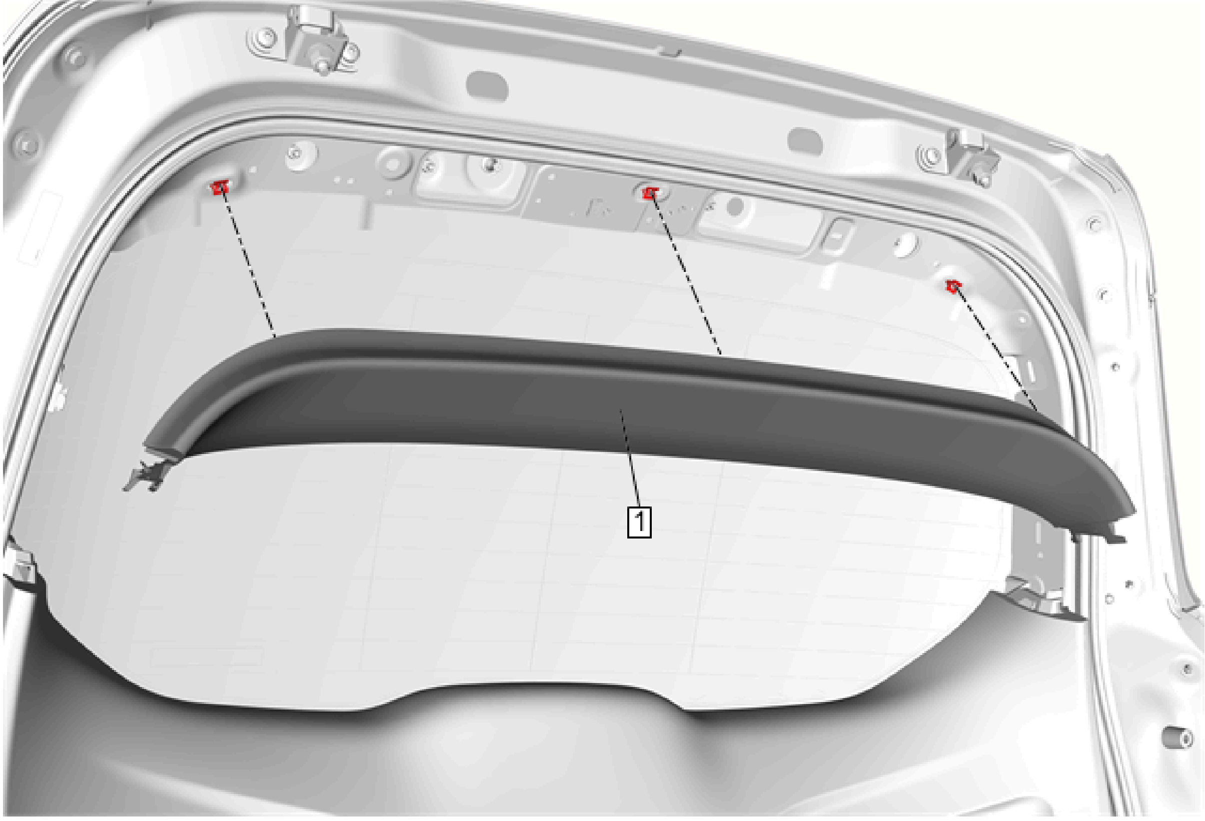

Fig. 61: Liftgate Upper Center Trim Finish Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Liftgate Upper Side Trim Finish Panel Replacement	
1	Liftgate Upper Center Trim Finish Panel

LIFTGATE UPPER SIDE TRIM FINISH PANEL REPLACEMENT

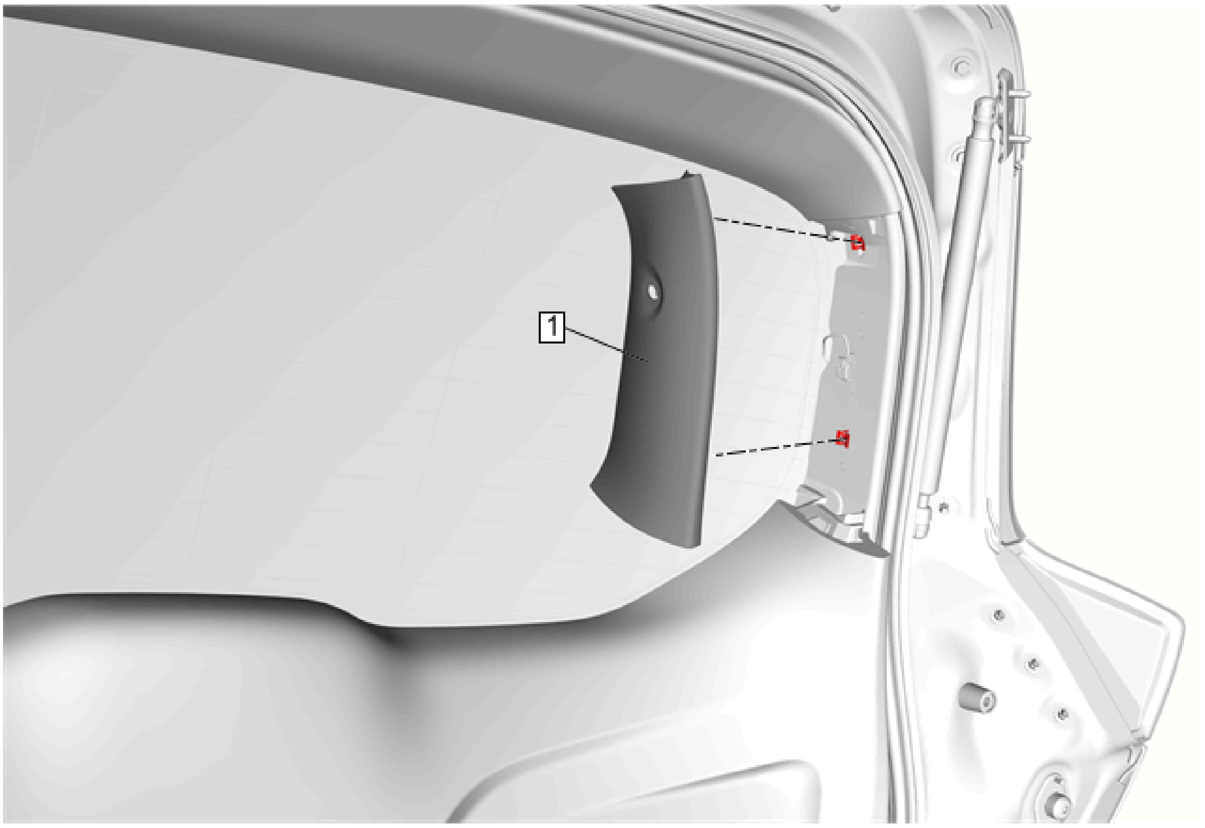

Fig. 62: Liftgate Upper Side Trim Finish Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name

Callout	Component Name
Preliminary Procedure Remove the luggage shade pivot. Luggage Shade Pivot Replacement	
1	Liftgate Upper Side Trim Finish Panel

LIFTGATE LOWER TRIM FINISH PANEL REPLACEMENT

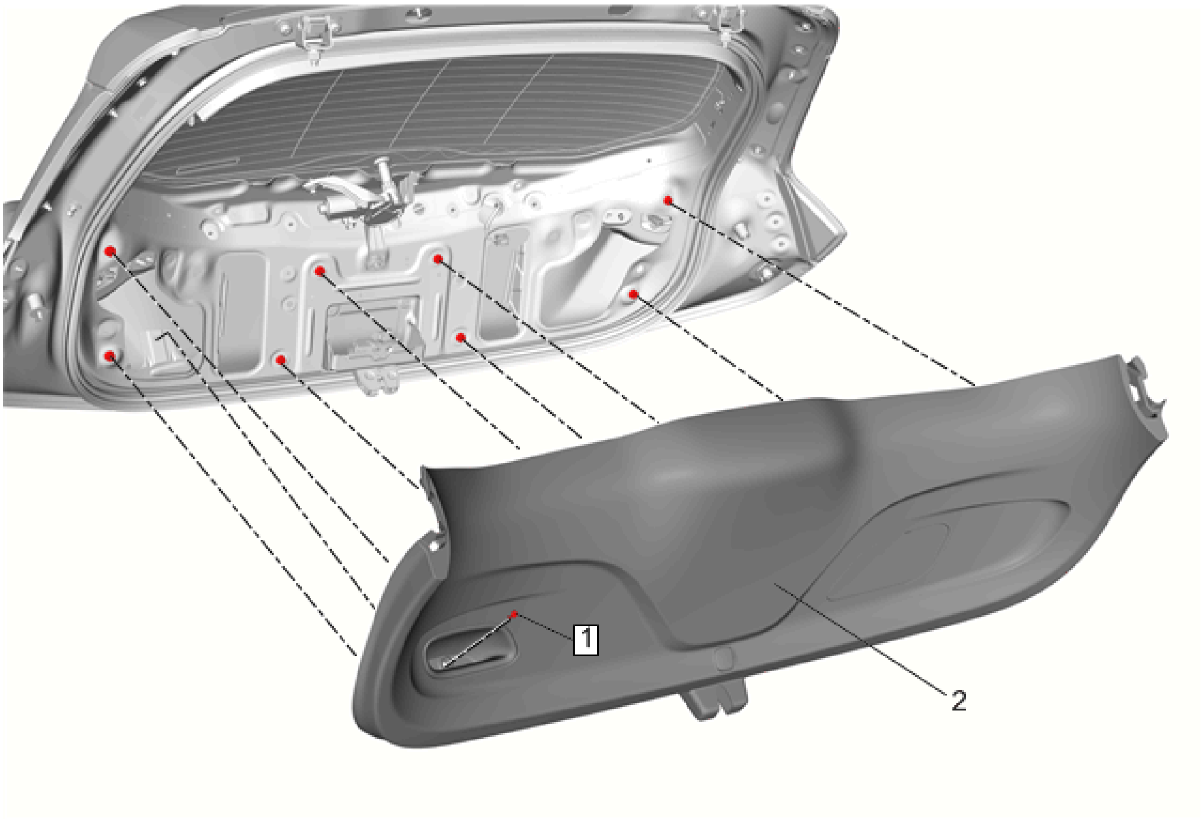

Fig. 63: Liftgate Lower Trim Finish Panel
Courtesy of GENERAL MOTORS COMPANY

Callout	Component Name
Preliminary Procedure Remove the liftgate upper side trim finish panel. Liftgate Upper Side Trim Finish Panel Replacement.	
1	Liftgate Inside Pull Handle Fastener **CAUTION:** Fastener Caution **Tighten** 1.8 N.m (16 lb in)
2	Liftgate Lower Trim Finish Panel **Procedure** 1. Use a trim panel removal tool to aid in the removal of the trim panel from the liftgate assembly. 2. Start at the top clip on the right-hand side of liftgate lower trim finish panel.

BODY PRESSURE RELIEF VALVE REPLACEMENT

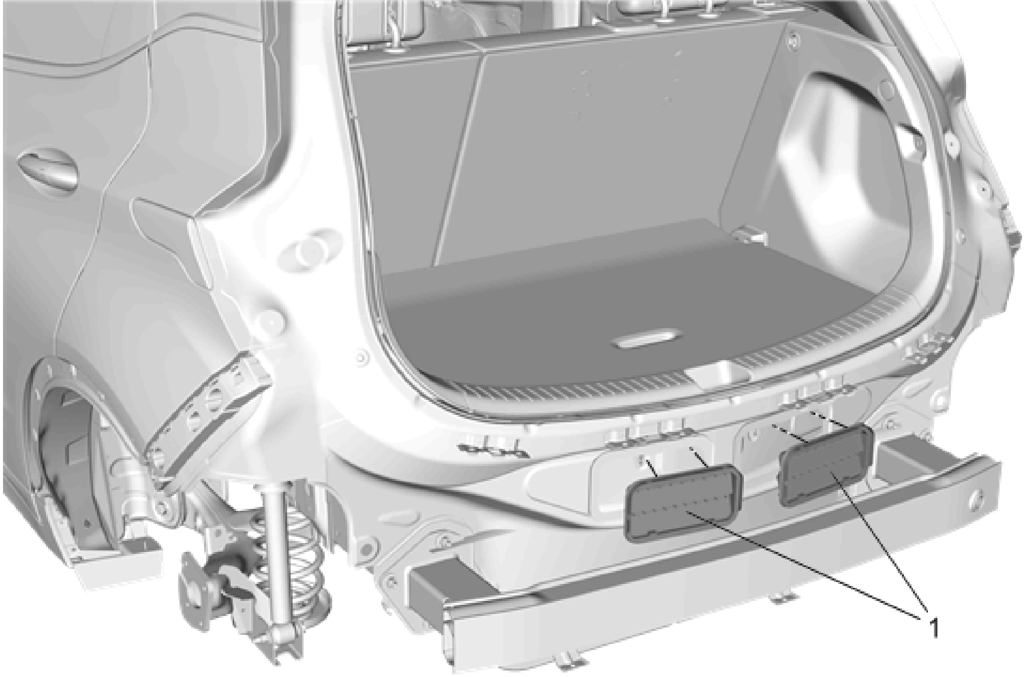

Fig. 64: Body Pressure Relief Valve
Courtesy of GENERAL MOTORS COMPANY

Call out	Component Name
Preliminary Procedure Rear Bumper Fascia Replacement	
1	Body Pressure Relief Valve **Procedure** Using the appropriate flat blade tool, release the tabs attaching the valves to the rear end panel to remove the body pressure relief valve.

2017 ACCESSORIES AND EQUIPMENT

Lighting - Description and Operation - Bolt EV

DESCRIPTION AND OPERATION

EXTERIOR LIGHTING SYSTEMS DESCRIPTION AND OPERATION

Exterior Lamps

The exterior lighting system consist of the following lamps if equipped:

- Automatic high beam assist
- Backup lamps
- Daytime running lamps
- Rear fog lamps
- Hazard warning lamps
- Headlamps
- Manual headlamp leveling
- Park, tail, license, and side marker lamps
- Stop lamps
- Turn signal lamps

Low Beam Headlamps

The headlamps may be turned ON in 3 different ways:

- When the headlamp switch is placed in the ON position, for normal operation
- When the headlamp switch is placed in the AUTO position, for automatic lamp control
- When the headlamp switch is placed in the AUTO position, with the windshield wipers ON in daylight conditions, after a 6 s delay

The BCM will also command the low beam headlamps ON during daylight conditions when the following conditions are met:

- Headlamp switch in the AUTO position
- Windshield wipers ON
- Vehicle in any gear but PARK

The body control module (BCM) monitors three signal circuits from the headlamp switch. When the headlamp switch is in the AUTO position, all three signal circuits are open. When placed in the AUTO position, the BCM monitors inputs from the ambient light sensor to determine if headlamps are required or if daytime running lamps will be activated based on outside lighting conditions. When the headlamp switch is placed in the OFF position, the headlamp switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the headlamp switch in the PARK position, the headlamp switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the headlamp switch is placed in the HEADLAMP position, both the headlamp switch park lamps ON signal circuit and the headlamp switch headlamps ON signal circuit are grounded. The BCM responds to the inputs by illuminating the park lamps and headlamps. When the low beam headlamps are requested, the BCM responds by applying ground to the low beam relay control circuit which energizes the low beam relay. With the low beam relay energized, the switch contacts close allowing battery voltage to flow through the left and right low beam fuses to the low beam control circuits and onto the left and right low beam headlamps.

When the BCM commands the low beam headlamps ON, the operator will notice the interior backlighting for the instrument cluster and the various other switches dim to the level of brightness selected by the instrument panel dimmer switch.

High Beam Headlamps

When the low beam headlamps are ON and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the BCM through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the left and right high beam fuses to the high beam control circuits and onto the left and right high beam solenoid actuators within the headlamp assemblies. Once the high beam solenoid actuators are active, the solenoid shutters open in each headlamp assembly exposing the remaining portion of the headlamp that was covered by the shutters illuminating the high beams at full intensity.

Automatic High Beam Assist

The automatic high beam assist system operates the high beam headlamps ON and OFF automatically when the system is activated and certain conditions are met. The automatic high beam assist system consists of a front camera module that detects light and is able to identify approaching vehicles on an even, straight road at a distance of greater than 0.4 km (0.25 mi). The front camera module analyzes light color, intensity, and movement. The automatic high beam assist system will turn OFF the high beam headlamps when approaching vehicle headlamps or preceding vehicle taillights are detected by the front camera module. Automatic high beam assist can be deactivated when the headlamp dimmer switch is moved from the neutral position to the high beam or flash to pass positions. Automatic high beam assist can be reactivated by operating the high beam select switch from the neutral position to the high beam position twice within 2 s.

Automatic High Beam Assist System Activation

- Vehicle ON
- Turn signal/multifunction switch placed in the AUTO position
- Turn signal/multifunction switch high beam dimmer switch must be in the neutral position
- Press the Auto High Beam ON/OFF switch located on the turn signal/multifunction switch
- Outside lighting conditions must be dark
- Vehicle speed greater than 25 MPH (40 km/h)

Automatic High Beam Assist System Operation

The following are conditions that the automatic high beam assist system will turn the high beam headlamps off during operation:

- The system detects approaching traffic headlamps
- The system detects preceding traffic tail lamps
- Ambient light level too high due to towns or twilight situations
- The vehicle's speed drops below 13 MPH (22 km/h)
- Delay

NOTE: **Automatic high beam assist may not operate properly if any of the following conditions exist:**

- Approaching and preceding vehicles lamps are undetectable due to dirt, snow, road spray, smoke, fog, or any other airborne conditions.
- The front camera module is covered with ice, dirt, snow, haze, or is obstructed.
- The vehicle is being driven on winding or hilly road conditions which would make any on coming vehicle headlamps undetectable by the automatic high beam assist system.

Automatic High Beam Assist System Deactivation

- Manually operating the turn signal/multifunction switch high beam dimmer switch from neutral to high beam position
- Press the Auto High Beam ON/OFF switch located on the turn signal/multifunction switch

Automatic High Beam Assist System Indicator

The status of the automatic high beam assist system is shown by a green indicator located on the instrument panel cluster. When automatic high beam assist is active, the indicator will be illuminated continuously. If the operator deactivates the automatic high beam assist system, the indicator will turn off.

Manual Headlamp Leveling

Each headlamp assembly contains a headlamp leveling actuator that is controlled by the headlamp leveling switch. The headlamp leveling switch is supplied with ignition voltage and contains a resistor ladder with 4 positions for adjusting the headlamps up or down. When the headlamp leveling switch is activated to the desired position, voltage from the B+ ignition circuit is pulled down through the resistor ladder and the voltage is applied to the left and right headlamp leveling actuators via the headlamp leveling control module. The headlamp leveling actuators are supplied with B+ and ground. When the headlamp leveling switch is activated, the left and right headlamp leveling actuators respond by moving the headlamps to the desired position.

Daytime Running Lamps

The daytime running lamps will illuminate continuously when the following conditions are met:

- The vehicle mode switch is in the RUN or CRANK position
- The shift lever is out of the PARK position for vehicles equipped with automatic transmissions or the parking brake is released for vehicles with manual transmissions
- The low and high beam headlamps are OFF

The ambient light sensor (T83) or rain sensor module (CE1) is used to monitor outside lighting conditions. The BCM monitors the ambient light sensor or rain sensor module via serial data to determine if outside lighting conditions are correct for either daytime running lights or automatic lamp control when the headlamp switch is in the AUTO position. In daylight conditions the BCM will command the designated daytime running lights ON. During low light conditions the BCM will command the low beam headlamps ON. Any function or condition that turns on the headlamps will cancel daytime running lights operation.

Rear Fog Lamps

When the rear fog lamp switch is placed in the ON position, battery voltage is applied from the BCM to the rear fog lamps. Ground for the rear fog lamps is applied at all times.

The BCM will send a message via GMLAN serial data to the instrument panel cluster to enable the rear fog lamp indicator.

Flash to Pass

When the low beam headlamps are on and the turn signal/multi-function switch is momentarily placed in the flash to pass position, ground is applied to the turn signal/multi-function switch. The turn signal/multifunction switch applies ground to the BCM through the flash to pass switch signal circuit. The BCM then applies ground to the high beam relay control circuit. This energizes the high beam relay, closing the switch side contacts of the high beam relay, applying battery voltage to the left and right high beam fuses. Battery voltage is applied from the high beam fuses through the high beam voltage supply circuit to the high beam headlamp assemblies. This causes the high beam headlamps to illuminate at full brightness momentarily or until the flash to pass switch is released.

Hazard Lamps

The hazard flashers may be activated in any power mode. The hazard switch signal circuit is momentarily grounded when the hazard switch is pressed. The body control module (BCM) responds to the hazard switch signal input by supplying battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard switch is activated, the BCM sends a serial data message to the instrument panel cluster requesting both turn signal indicators to be cycled ON and OFF.

The instrument panel dimmer switch controls the brightness of the interior backlighting components. When the instrument panel dimmer switch is placed in a desired brightness position, the body control module (BCM) receives a signal from the instrument panel dimmer switch and responds by applying a pulse width modulated (PWM) voltage to the hazard switch light emitting diode (LED) backlighting control circuit illuminating the LED to the desired level of brightness.

Park, Tail, License, and Side Marker Lamps

The park lamps, tail lamps, license plate lamps, and side marker lamps are turned ON when the headlamp switch is placed in the PARK LIGHT or LOW BEAM position or anytime the headlights are requested. When the BCM receives a request from the headlamp switch to turn ON the park lamps the BCM will apply battery voltage to the left and right park lamp, side marker lamp, and license plate lamp control circuits illuminating the left and right park lamps, side marker lamps, and license plate lamps.

When the trailer lighting control module receives a request from the headlamp switch to turn ON the park lamps the trailer lighting control module will apply battery voltage to the left and right tail/stop lamp control circuits illuminating the left and right tail/stop lamps.

Stop Lamps

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the center high mounted stop lamp control circuit illuminating the center high mounted stop lamp.

When the brakes have been applied the trailer lighting control module will apply battery voltage to the left and right tail/stop lamp and auxiliary tail/stop lamp control circuits. The left and right tail/stop lamps will illuminate when the liftgate is in the CLOSED position and the left and right auxiliary tail/stop lamps will illuminate when the liftgate is in the OPEN position.

Regen on Demand allows increased deceleration by pressing and holding the steering wheel paddle. It works in D (Drive) and L (Low). The accelerator pedal can be used to manage deceleration while using Regen on Demand. Cruise control will turn off and the brake lamps may come on when this feature is activated.

Turn Signal Lamps

Ground is applied at all times to the turn signal/multi-function switch. The turn signal lamps may only be activated with the vehicle ON/OFF switch in the Service Mode or ON position. When the turn signal/multi-function switch is placed in either the TURN RIGHT or TURN LEFT position, ground is applied to the BCM through either the right turn or left turn signal switch signal circuit. The BCM then applies a pulsating voltage to the front and rear turn signal lamps through their respective voltage supply circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Backup Lamps

With the vehicle ON and the transmission in the REVERSE position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the REVERSE position. The BCM applies battery voltage to the backup lamps control circuit illuminating the backup lamps. Once the driver moves the gear selector out of the REVERSE position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamps control circuit. The vehicle must be ON for the backup lamps to operate.

Battery Run Down Protection/Inadvertent Power

To provide battery run down protection, the exterior lamps will be deactivated automatically under certain conditions. The BCM monitors the state of the headlamp switch. If the park or headlamp switch is ON when the vehicle mode switch is placed in either the CRANK or RUN position and then placed in the OFF position, the BCM initiates a 10 min timer. At the end of the 10 min, the BCM will turn off the control power output to the park lamp controls as well as the headlamp relay coils, deactivating the exterior lamps. This feature will be cancelled if any power mode other than OFF becomes active. The BCM will disable battery run down protection if any of the following conditions exist. The park or headlamp switch is placed in the ON to OFF position, and back to the ON position during battery run down protection. The BCM determined that the park or headlamp switch was not active when the vehicle mode switch was turned OFF.

INTERIOR LIGHTING SYSTEMS DESCRIPTION AND OPERATION

Interior Lamps

The interior lamps consist of 2 groups. The first group includes lamps that may not be dimmed.

- Dome lamps
- Courtesy lamps
- Reading lamps
- Rear compartment courtesy lamp

Dome Lamps

The dome lamp switch contains 3 positions: DOOR, OFF, and ON. The ON position provides a ground for continuous operation and the dome lamps will remain illuminated until the switch is placed in either the DOOR or OFF position. When in the DOOR position, the dome lamp operation is controlled by the body control module (BCM). When any door is opened, the door ajar switch contacts close and the BCM receives a door-open input. The BCM illuminates the dome lamp when any door is opened or a door lock/unlock request is activated with the key fob. After all doors have been closed, the dome lamp will remain illuminated approximately 3 s after the last door closes. When the driver places the dome lamp switch in the OFF position, the dome lamps will be disabled. In the event that the dome lamps were to remain illuminated for more than 10 min with the ignition switch in the OFF position, the BCM will deactivate the dome lamp control circuit to prevent total battery discharge. The dome lamps will turn OFF using the theater dimming feature when controlled by the BCM.

Reading Lamps

The inadvertent power supply voltage circuit from the BCM provides battery positive voltage to each reading lamp. When a reading lamp switch is activated, the switch contacts close providing a path to ground and the reading lamp illuminates. If the operator inadvertently leaves a reading lamp ON, the BCM will turn all interior lamps OFF after 10 min has passed since any switch activation has been detected by the BCM.

Rear Compartment Courtesy Lamp

When the rear compartment is opened, the rear compartment lid latch opens providing a rear compartment open input signal to the BCM. The BCM responds by applying battery voltage to the rear compartment courtesy lamp control circuit illuminating the rear compartment courtesy lamp.

Courtesy/Illuminated Entry Lamps

The following lamps may be manually turned ON by placing the interior lamp switch in the ON position, or by opening a door while the switch is in the AUTOMATIC LIGHT position.

- The dome lamp
- The liftgate lamps
- Courtesy lamps

The courtesy lamp supply voltage circuit of the body control module (BCM) supplies battery positive voltage to the dome lamp, the liftgate lamps and courtesy lamps. When any door is opened, the door jamb switch contacts close providing a door open input to the BCM. The BCM then provides a B+ to the interior lamps with the switch in the AUTO position. The interior lamps receive a ground when the switch is in the ON position.

NOTE: **If the liftgate is opened after all the modules go to sleep, the dome light will not come on. The liftgate ajar switch input to the BCM will not wake up the BCM once it has gone to sleep, so the dome light will not come on. Once the BCM gets an input to wake it up, from remote keyless entry or a door handle, the dome light will turn on when the liftgate is opened.**

If the driver inadvertently leaves any interior lamp ON, the BCM will turn it OFF after a 20 min time-out.

The courtesy lamps will turn OFF immediately if the vehicle ON/OFF switch is turned to the ON position or approximately 20 s after all doors are closed.

Keyless Entry Interior Illumination

When the BCM receives a door unlock command from the remote keyless entry transmitter, the BCM will flash the park lamps several times, illuminate the courtesy and park lamps, and illuminate the low beam headlamps at low intensity. The lamps will remain on until the vehicle ON/OFF switch is turned from the OFF position, a keyless entry transmitter door lock command is received, or after an approximate 20 s delay.

Interior Lamps Dimming

The second group includes lamps which may dim. This group may use a combination of vacuum fluorescent illumination, LEDs and incandescent lamps.

- Accent lamp - left instrument panel
- Accent lamp - right instrument panel
- Headlamp switch
- Multifunction switch 1 - instrument panel
- Multifunction switch 2 - instrument panel
- Door lock switch - driver
- Door lock switch - passenger
- The instrument panel cluster
- Park brake control switch
- Seat heating switch - left rear
- Seat heating switch - right rear
- Power window switches
- Various switches

When the vehicle ON/OFF switch is turned to the ON position, the vacuum fluorescent display, radio, turns ON at maximum brightness. When the park lamps are ON, all incandescent back lighting turn ON at the dimming level indicated by the instrument panel dimmer switch. At the same time all fluorescent display displays dim to match the indicated dimming level. When the headlamp switch is placed in the PARK position, the park lamp supply voltage circuit provides an input to the BCM. The BCM then supplies voltage to the instrument panel dimmer switch through the dimming control circuit. The setting of the instrument panel dimmer switch determines the amount of voltage that the instrument panel dimmer switch supplies to the BCM through the instrument panel dimming lamps low reference circuit. The BCM then sends a PWM voltage to all the interior lamps. All the fluorescent display and incandescent back lighting lamps are provided a specific voltage and are then grounded. When the headlight switch is turned to the park lamp or headlamp position, all incandescent back lighting turn ON at the dimming level indicated by the instrument panel dimmer switch. When the instrument panel dimmer switch is moved from MIN to MAX, all fluorescent display displays, as well as all incandescent back lighting respond from minimum intensity to maximum brightness in response to the instrument panel dimmer switch.

Inadvertent Power

The BCM used in this vehicle controls the lighting system through circuits that enable the interior lamps. The BCM opens these enabling circuits shortly after the vehicle ON/OFF switch is turned OFF with no lamp switch activity. If the vehicle ON/OFF switch is turned to any position other than OFF, or if a lamp switch is activated during this period, the timer will reset itself.

Headlamp Switch Low Reference	1	1	1	-
1. Interior Backlighting Malfunction				

Circuit/System Description

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides B+, low reference, and signal circuits to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Park lamps ON.

Conditions for Setting the DTC

DTC B1395 03

- The BCM detects a short to ground in the instrument panel dimmer switch B+ reference circuit.

- The BCM detects a short to ground in the instrument panel dimmer switch signal circuit.

DTC B1395 07

- The BCM detects a short to voltage in the instrument panel dimmer switch B+ reference circuit.
- The BCM detects a short to voltage in the instrument panel dimmer switch signal circuit.

Actions Taken When the DTC Sets

All interior backlighting defaults to FULL bright.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S30 Headlamp Switch, vehicle in Service Mode.
2. Test for B+ between the B+ circuit terminal 12 and ground.
    - **If less than B+**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If B+**
3. Test for B+ between the B+ circuit terminal 12 and the low reference circuit terminal 7.
    - **If less than B+**

   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the low reference circuit terminal 7 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If B+**

4. Verify a test lamp does not illuminate between the B+ circuit terminal 12 and the signal circuit terminal 11.
   - **If the test lamp illuminates**
   1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If the test lamp does not illuminate**
5. Test for B+ between the B+ circuit terminal 12 and the signal circuit terminal 11.
   - **If less than B+**
   1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit terminal 11 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If B+**
6. Test or replace the S30 Headlamp Switch.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Headlamp Switch Replacement
- Refer to Control Module References for BCM replacement, programming and setup

DTC B1480: BATTERY RUNDOWN PROTECTION CIRCUIT SHORT TO GROUND

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC B1480 02

Battery Rundown Protection Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Courtesy Lamps Control - Terminal 2 X7	B1480 02	1	1	-
Dome/Reading Lamps - Overhead Console Ground	-	1, 2	-	-
Dome/Reading Lamps - Rear Ground	-	1, 2	-	-
1. Courtesy Lamps Malfunction 2. Dome Lamps Malfunction				

Circuit/System Description

The body control module (BCM) supplies battery voltage to the front and rear reading lamps via the courtesy lamp control circuit. The front and rear reading lamps are controlled by individual switches that are activated by the operator when additional cabin lighting is required. In the event that any of these courtesy lamps were to remain illuminated for more than 10 min with the vehicle ON/OFF switch in the OFF position and no doors opened, the BCM will deactivate the courtesy lamp control circuit to prevent total battery discharge.

Conditions for Running the DTC

Battery voltage must be between 9 - 16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the courtesy lamp control circuit.

Actions Taken When the DTC Sets

The BCM will disable the circuit and the front and rear reading lamps will be inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Diagnostic Aids

The Inadvertent Load scan tool command operates when the front and rear dome lamp switches are in the ON position.

Circuit/System Testing

1. Vehicle OFF, exterior lamps OFF, disconnect the harness connectors at the components listed below.
    - E37D Dome/Reading Lamps - Overhead Console
    - E37R Dome/Reading Lamps - Rear
2. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
    - E37D Dome/Reading Lamps - Overhead Console terminal 2
    - E37R Dome/Reading Lamps - Rear terminal 1
3. Verify the test lamp turns ON and OFF when commanding the Inadvertent Load ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
4. Test or replace the appropriate courtesy lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Roof Console Replacement**
- Refer to **Center Courtesy Lamp Replacement**
- Refer to **Rear Seat Position Center Courtesy Lamp Bulb Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

DTC B2540: REAR FOG LAMPS CONTROL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B2540 02

Rear Fog Lamps Control Circuit Short to Ground

DTC B2540 04

Rear Fog Lamps Control Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Rear Fog Lamp Control	B2540 02	B2540 04	1	-
Rear Fog Lamp Ground	-	1	-	-
1. Rear Fog Lamp Malfunction				

Circuit/System Description

The rear fog lamp switch signal circuit is grounded momentarily by pressing the rear fog lamp switch. The body control module (BCM) responds to the rear fog lamp request by applying voltage to the rear fog lamp control circuit which illuminates the rear fog lamp.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Rear fog lamp ON.

Conditions for Setting the DTC

DTC B2540 02

The BCM detects a short to ground in the rear fog lamp control circuit.

DTC B2540 04

The BCM detects an open/high resistance in the rear fog lamp control circuit.

Actions Taken When the DTC Sets

The rear fog lamp will not operate when the park lamps are ON and the rear fog lamp switch is active.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, exterior lamps OFF, disconnect the X410 harness connector at the E5EA Tail Lamp - Auxiliary Left.
2. Test for less than 5 Ω between the ground circuit terminal 6 and ground.
    - **If 5 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
3. Connect a test lamp between the control circuit terminal 4 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the Rear Fog Lamp(s) Relay ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the E29R Fog Lamp - Rear.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea with Rear Fog)** **Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea, North America with Back-up Bulb)**
- Refer to **Control Module References** for BCM replacement, programming, and setup

DTC B2545: BACKUP LAMPS CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B2545 01

Backup Lamps Circuit Short to Battery

DTC B2545 02

Backup Lamps Circuit Short to Ground

DTC B2545 04

Backup Lamps Circuit Open

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Backup Lamp Control	B2545 02	1	1	-
Backup Lamp Ground	-	1	-	-
1. Backup Lamps Malfunction				

Circuit/System Description

With the vehicle ON and the transmission in the reverse position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamp control circuit illuminating the backup lamp. Once the driver moves the gear selector out of the reverse position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamp control circuit. The vehicle must be ON for the backup lamps to operate.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Vehicle ON.
- Transmission placed in REVERSE gear.

Conditions for Setting the DTC

DTC B2545 01 and B2545 04

The BCM detects an open/high resistance in the backup lamp control circuit.

DTC B2545 02

The BCM detects a short to ground in the backup lamp control circuit.

Actions Taken When the DTC Sets

The backup lamp will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

DTC B2570: TRUNK LAMP CONTROL CIRCUIT SHORT TO GROUND

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B2570 02

Trunk Lamp Control Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Rear Compartment Courtesy Lamp Control	B2570 02	1	1	-
Rear Compartment Courtesy Lamp Ground	-	1	-	-
1. Rear Compartment Lamp Malfunction				

Circuit/System Description

The body control module (BCM) applies battery voltage to the rear compartment courtesy lamp through the rear compartment courtesy lamp control circuit. When the BCM receives a rear liftgate open input from the rear compartment lid latch, the BCM applies battery voltage to the rear compartment courtesy lamp control circuit illuminating the rear compartment courtesy lamp. In the event that the rear compartment courtesy lamp were to remain illuminated for more than 10 min with the vehicle ON/OFF switch in the OFF position, the BCM will deactivate the rear compartment courtesy lamp control circuit to prevent total battery discharge.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Liftgate OPEN.

Conditions for Setting the DTC

The BCM detects a short to ground in the rear compartment courtesy lamp control circuit.

Actions Taken When the DTC Sets

The rear compartment courtesy lamp is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the E8S Rear Compartment Courtesy Lamp. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 2 and ground.
    - **If 5 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
3. Connect a test lamp between the control circuit terminal 1 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the Cargo Lamp ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the E8S Rear Compartment Courtesy Lamp.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Cargo Center Courtesy Lamp Bulb Replacement
- Refer to Control Module References for BCM replacement, programming, and setup

DTC B257A: HEADLAMP SWITCH INPUT SIGNALS CORRELATION MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.

- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC B257A 00

Headlamp Switch Input Signals Correlation Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Headlamp Switch Park Lamps ON Signal	2	B257A 00	2	-
Headlamp Switch Headlamps OFF Signal	B257A 00	1	1	-
Headlamp Switch Headlamps ON Signal	B257A 00	1	1	-
Headlamp Switch Ground	-	1	-	-
1. Headlamps Malfunction 2. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

For headlamp operation, the body control module (BCM) monitors three signal circuits from the headlamp switch. When the headlamp switch is in the AUTO position, the three signal circuits are open and the BCM relies on the ambient light sensor input to turn the headlamps and daytime running lamps (DRLs) ON and OFF. When the headlamp switch is placed in the OFF position, the headlamp switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the headlamp switch in the PARK LAMPS position, the headlamp switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the headlamp switch is in the HEADLAMP position, both the headlamp switch park lamps ON signal circuit and the headlamp switch headlamps ON signal circuit are grounded. The BCM responds by commanding the park lamps and headlamps ON.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

- The BCM detects an open/high resistance in the headlamp switch park lamps ON signal circuit.
- The BCM detects a short to ground in the headlamp switch headlamps ON signal circuit.
- The BCM detects a short to ground in the headlamp switch headlamps OFF signal circuit.

Actions Taken When the DTC Sets

- When DTC B257A 00 is present on the headlamp switch headlamps OFF signal circuit, the low beam and high beam headlamps are inoperative.
- When DTC B257A 00 is present on the headlamp switch headlamps ON signal circuit, the low beam headlamps are always ON in the PARK position and the park lamps are always ON in all positions.
- When DTC B257A 00 is present on the headlamp switch park lamps ON signal circuit, the high beam and low beam headlamps are inoperative in the PARK and HEAD positions.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, all doors closed, all accessories OFF, disconnect the harness connector at the S30 Headlamp Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 8 and ground.
    - **If 5 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Automatic Headlamps Disable Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 3 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and the ground circuit terminal 8.
6. Verify the scan tool Automatic Headlamps Disable Switch parameter is Active.
    - **If not Active**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal 3 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.

   - **If Active**

7. Verify the scan tool Park Lamps Switch parameter is Inactive.
   - **If not Inactive**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit terminal 5 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If Inactive**
8. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the ground circuit terminal 8.
9. Verify the scan tool Park Lamps Switch parameter is Active.
   - **If not Active**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit terminal 5 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If Active**
10. Verify the scan tool Headlamps On Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 1 and ground.
       - If less than infinite resistance, repair the short to ground on the circuit.
       - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
11. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground circuit terminal 8.
12. Verify the scan tool Headlamps On Switch parameter is Active.
    - **If not Active**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal 1 and ground.
       - If 1 V or greater, repair the short to voltage on the circuit.
       - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
       - If 2 Ω or greater, repair the open/high resistance in the circuit.
       - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**
13. Test or replace the S30 Headlamp Switch.

1. Headlamps Malfunction				

Circuit/System Description

The high beam and flash to pass functions are contained within the turn signal/multifunction switch. The BCM provides the turn signal/multifunction switch with two signal circuits, the high beam signal circuit and the flash to pass signal circuit. When the low beam headlamps are ON and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the BCM through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the left and right high beam fuses to the high beam control circuits and on to the left and right high beam solenoid actuators within the headlamp assemblies. Once the high beam solenoid actuators are active, the solenoid shutters open in each headlamp assembly exposing the remaining portion of the headlamp that was covered by the shutters illuminating the high beams at full intensity.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- High beam headlamps ON.

Conditions for Setting the DTC

DTC B2580 01

The BCM detects a short to voltage in the headlamp high beam relay control circuit.

DTC B2580 02 and B2580 04

The BCM detects a short to ground or an open/high resistance in the headlamp high beam relay control circuit.

Actions Taken When the DTC Sets

- For an open/high resistance fault, the high beam headlamps and flash to pass function are inoperative. The high beam indicator on the instrument cluster operates normally.
- For a short to ground fault, the high beam headlamps and high beam indicator on the instrument cluster are always ON with the headlamp switch in the AUTO or HEAD positions.
- For a short to voltage fault, the high beam headlamps and flash to pass function are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for B+ between the control circuit terminal 18 and ground.
    - **If less than B+**
    1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
    2. Test for infinite resistance between the control circuit terminal and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the X50A Fuse Block - Underhood.
    - **If B+**
3. Vehicle OFF, connect a 3 A fused jumper between the control circuit terminal 18 and ground, vehicle in Service Mode, low beams ON.
4. Verify the high beam headlamps illuminate.

    - **If the high beam headlamps do not illuminate**
        1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, vehicle in Service Mode.
        2. Test for less than 1 V between the control circuit terminal 18 and ground.
            - If 1 V or greater, repair the short to voltage on the circuit.
            - If less than 1 V, replace the X50A Fuse Block - Underhood.
    - **If the high beam headlamps illuminate**

5. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Battery Distribution Fuse Block Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

DTC B2585 OR B3867: LEFT/RIGHT PARK LAMPS CONTROL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

1. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

When the headlamp switch is placed in the HEAD or PARK position, ground is applied to the park lamps ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the park lamps control circuit illuminating the park and side marker lamps.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Park lamps ON.

Conditions for Setting the DTC

DTC B2585 02

The BCM detects a short to ground in the left front park lamp control circuit.

DTC B3867 02

The BCM detects a short to ground in the right front park lamp control circuit.

Actions Taken When the DTC Sets

DTC B2585 02

The left front park lamp and left front and rear side marker lamps are inoperative.

DTC B3867 02

The right front park lamp and right front and rear side marker lamps are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

DTC B2585

1. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the appropriate park lamp listed below.
    - E13LA Headlamp Assembly - Left
    - E2LR Side Marker Lamp - Left Rear
2. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
    - E13LA Headlamp Assembly - Left terminal 8
    - E2LR Side Marker Lamp - Left Rear terminal 2
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
    - E13LA Headlamp Assembly - Left terminal 4
    - E13LA Headlamp Assembly - Left terminal 7 (-TR6)
    - E2LR Side Marker Lamp - Left Rear terminal 1
4. Verify the test lamp turns ON and OFF when commanding the Left Park Lamps ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate left park lamp.

DTC B3867

1. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the appropriate park lamp listed below.
    - E13RA Headlamp Assembly - Right
    - E2RR Side Marker Lamp - Right Rear
2. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
    - E13RA Headlamp Assembly - Right terminal 8
    - E2RR Side Marker Lamp - Right Rear terminal 2
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
    - E13RA Headlamp Assembly - Right terminal 4
    - E13RA Headlamp Assembly - Right terminal 7 (-TR6)
    - E2RR Side Marker Lamp - Right Rear terminal 1
4. Verify the test lamp turns ON and OFF when commanding the Right Park Lamps ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate right park lamp.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Headlamp Replacement
- Refer to Rear Side Marker Lamp Replacement
- Refer to Control Module References for BCM replacement, programming, and setup

DTC B258A: LOW BEAM CONTROL CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptors

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Headlamp Low Beam Relay Control	B258A 02	B258A 04	B258A 01	-
Headlamp Low Beam Control - Left	1	1	1	-
Headlamp Low Beam Control - Right	1	1	1	-
Headlamp Assembly Ground - Left	-	1	-	-
Headlamp Assembly Ground - Right	-	1	-	-
1. Headlamps Malfunction				

Circuit/System Description

The headlamp low beam relay is supplied with battery voltage at all times. When the headlamp switch is in the ON position ground is applied to the body control module (BCM) through the low beam signal circuit. The BCM responds to the low beam request by applying ground to the low beam relay control circuit which energizes the headlamp low beam relay. With the low beam relay energized, the switch contacts close allowing battery voltage to flow through the low beam fuses to the low beam headlamps illuminating the low beam headlamps.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Low beam headlamps ON.

Conditions for Setting the DTC

DTC B2580 01

The BCM detects a short to voltage in the headlamp low beam relay control circuit.

DTC B2580 02

The BCM detects a short to ground in the headlamp low beam relay control circuit.

DTC B2580 04

The BCM detects an open/high resistance in the headlamp low beam control circuit.

Actions Taken When the DTC Sets

- The left and right low beam headlamps are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, remove the KR49 Headlamp Low Beam Relay.
2. Connect a test lamp between the control circuit terminal 86 and B+, vehicle in Service Mode.
3. Verify the test lamp turns ON and OFF when commanding the Low Beam Lamps ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Vehicle OFF.
    4. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit terminal and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
4. Test or replace the KR49 Headlamp Low Beam Relay.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**

DTC B2605 02

Right Daytime Running Lamps Control Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Daytime Running Lamp Control - Left	B2600 02	1	1	-
Daytime Running Lamp Control - Right	B2605 02	1	1	-
Headlamp Assembly Ground - Left	-	1	-	-
Headlamp Assembly Ground - Right	-	1	-	-
1. Daytime Running Lamps Malfunction				

Circuit/System Description

The ambient light/sunload sensor is used to monitor outside lighting conditions. The ambient light/sunload sensor provides a serial data message to the body control module (BCM) based on outside lighting conditions to determine if outside lighting conditions are correct for either daytime running lamps or automatic lamp control when the headlamp switch is in the AUTO position. In daylight conditions the BCM will command the designated daytime running lamps ON. During low light conditions the BCM will command the low beam headlamps ON. Any function or condition that turns on the headlamps will cancel daytime running lamps operation.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

DTC B2600 02

The BCM detects a short to ground in the left daytime running lamp control circuit.

DTC B2605 02

The BCM detects a short to ground in the right daytime running lamp control circuit.

Actions Taken When the DTC Sets

DTC B2600 02

The left daytime running lamp is inoperative.

DTC B2605 02

The right daytime running lamp is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Diagnostic Aids

The daytime running lamps will only operate in daylight conditions with the vehicle ON and in any transmission gear except PARK.

Circuit/System Testing

1. Vehicle OFF, exterior lamps OFF, disconnect the appropriate harness connector listed below.
    - X110 - left daytime running lamp
    - X120 - right daytime running lamp
2. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
    - Terminal 5 (-TR6)
    - Terminal 7 (TR6)
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 3 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Dedicated Daytime Running Lamp ON and OFF with a scan tool.

    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate E13 Headlamp Assembly.

1. Interior Backlighting Malfunction				

Circuit/System Description

The headlamp switch is used to increase and decrease the brightness of the interior backlighting components. The headlamp switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides a B+, low reference, and signal circuits to the headlamp switch. When the headlamp switch is placed in the desired position, the dimmed voltage setting is applied from the headlamp switch through the headlamp switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.

Conditions for Setting the DTC

DTC B2610 01

The BCM detects a short to battery in the LED backlight dimming control circuit terminal 8 X2 or the LED backlight dimming control circuit terminal 9 X7.

DTC B2610 02

The BCM detects a short to ground in the LED backlight dimming control circuit terminal 8 X2 or the LED backlight dimming control circuit terminal 9 X7.

DTC B2610 04

The BCM detects an open/high resistance in the LED backlight dimming control circuit terminal 8 X2 or the LED backlight dimming control circuit terminal 9 X7.

Actions Taken When the DTC Sets

The BCM will disable the LED backlight dimming control circuits.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

NOTE: **Each component with backlighting may need to be disconnected to isolate a short to voltage or short to ground. Use the schematics to identify the following:**

- **Backlighting components the vehicle is equipped with**
- **Each component's control and ground circuit terminals**
- **Component locations on the backlighting control circuit**

1. Vehicle OFF, all doors closed, all accessories OFF, disconnect the harness connector at the component with inoperative backlighting. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the appropriate ground circuit terminal and ground.
    - **If 5 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
3. Connect a test lamp between the appropriate control circuit terminal and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the LED Backlight Dimming ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
        - X2 terminal 8
        - X7 terminal 9
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.

- **If the test lamp is always ON**
  1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, vehicle in Service Mode
     - X2 terminal 8
     - X7 terminal 9
  2. Test for less than 1 V between the control circuit terminal and ground.
     - If 1 V or greater, repair the short to voltage on the circuit.
     - If less than 1 V, replace the K9 Body Control Module.
- **If the test lamp turns ON and OFF**

5. Test or replace the component with inoperative backlighting.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Parking Brake Actuator Switch Replacement
- Refer to Headlamp Switch Replacement
- Refer to Door Lock Switch Replacement
- Refer to Rear Seat Heater Switch Replacement
- Refer to Radio Control Switch Replacement - Steering Wheel (Left Side Lower) Radio Control Switch Replacement - Steering Wheel (Left Side Rear) Radio Control Switch Replacement - Steering Wheel (Right Side Front) Radio Control Switch Replacement - Steering Wheel (Right Side Rear)
- Refer to Hazard Warning Switch Replacement
- Refer to Control Module References for BCM replacement, programming, and setup

DTC B2615: PASSENGER COMPARTMENT DIMMING 2 CIRCUIT SHORT TO GROUND

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

DTC Descriptor

DTC B2615 02

Passenger Compartment Dimming 2 Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F8DA (BCM 2) Fuse B+	B2615 02	B2615 02	-	-
Dome Lamps Control - Terminal 1 X7	B2615 02	1	1	-
Dome/Reading Lamps - Overhead Console Ground	-	1	-	-
Dome/Reading Lamps - Rear Ground	-	1	-	-
1. Dome Lamps Malfunction				

Circuit/System Description

The dome lamp switch has 3 positions: DOOR, OFF, and ON. The ON position provides a ground for continuous operation and the dome lamps will remain illuminated until the switch is placed in either the DOOR or OFF position. When in the DOOR position, the dome lamps operation is controlled by the body control module (BCM). When any door is opened, the door ajar switch contacts close and the BCM receives a door-open input. The BCM illuminates the dome lamps when any door is opened or a door lock/unlock request is activated with the key fob. After all doors have been closed, the dome lamps will remain illuminated approximately 3 s after the last door closes. When the driver places the dome lamp switch in the OFF position, the dome lamps will be disabled. In the event that the dome lamps were to remain illuminated for more than 10 min with the vehicle ON/OFF switch in the OFF position and no doors opened, the BCM will deactivate the dome lamps control circuit to prevent total battery discharge.

Conditions for Running the DTC

Battery voltage must be between 9 - 16 V.

Conditions for Setting the DTC

- The BCM detects a short to ground or an open/high resistance in the F8DA (BCM 2) fuse B+ circuit.
- The BCM detects a short to ground in the dome lamps control circuit.

Actions Taken When the DTC Sets

The front and middle dome lamps are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Control Module References for scan tool information

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Test for less than 2 Ω in the B+ circuit end to end.

- If 2 Ω or greater, repair the open/high resistance in the circuit.
- If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**

1. Test for infinite resistance between the B+ circuit and ground.
   - If less than infinite resistance, repair the short to ground on the circuit.
   - If infinite resistance, replace the K9 Body Control Module

- **If the test lamp illuminates**

3. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
4. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the inoperative E37 Dome/Reading Lamp. It may take up to 2 min for all vehicle systems to power down.
5. Test for less than 5 Ω between the ground circuit terminals listed below and ground.
   - E37D Dome/Reading Lamps - Overhead Console terminal 4
   - E37R Dome/Reading Lamps - Rear terminal 3
   - **If 5 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuits end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 5 Ω**
6. Connect a test lamp between the control circuit terminals listed below and ground, vehicle in Service Mode.
   - E37D Dome/Reading Lamps - Overhead Console terminal 3
   - E37R Dome/Reading Lamps - Rear terminal 4
7. Verify the test lamp turns ON and OFF when commanding the Courtesy Lamps ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
8. Test or replace the inoperative E37 Dome/Reading Lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Roof Console Replacement**
- Refer to **Center Courtesy Lamp Replacement**
- Refer to **Rear Seat Position Center Courtesy Lamp Bulb Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

DTC B2625: DISPLAY DIMMING PULSE WIDTH MODULATION OUTPUT CIRCUIT SHORT TO GROUND

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B2625 02

Display Dimming Pulse Width Modulation Output Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Switch Indicator LED Backlight Control Terminal 5 X1	B2625 02	1	1	-
Lane Departure Warning Switch Control	1	1	1	-
Parking Assist Control Switch Control	1	1	1	-
Seat Heating Switch - Left Rear Control	1	1	1	-
Seat Heating Switch - Right Rear Control	1	1	1	-
1. Interior Backlighting Malfunction				

Circuit/System Description

The body control module (BCM) applies battery voltage to the amber switch indicators through the amber LED indicator control circuit. When the appropriate switch has been activated, the BCM applies a pulse width modulated voltage through the amber LED indicator control circuit illuminating the rear seat heating switches, park assist control switch, and lane departure warning switch amber LEDs.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the switch indicator LED backlight dimming control circuit terminal 5 X1.

Actions Taken When the DTC Sets

The switch indicator LED backlight dimming control circuit terminal 5 X1 driver is shut down.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, disconnect the harness connectors at the components listed below.
    - S32LR Seat Heating Switch - Left Rear
    - S32RR Seat Heating Switch - Right Rear
    - S48D Multifunction Switch 2 - Instrument Panel

NOTE: **The test lamp in the following step will illuminate at LOW intensity. This is normal circuit operation and does not indicate a circuit malfunction.**

2. Vehicle in Service Mode, verify a test lamp illuminates between each control circuit terminal 6 and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
3. Verify a test lamp does not illuminate at FULL intensity between each control circuit terminal 6 and ground.
    - **If the test lamp illuminates at FULL intensity**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp does not illuminate at FULL intensity**
4. Test or replace the component with the inoperative switch indicator.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Rear Seat Heater Switch Replacement**

- Refer to **Instrument Panel Center Accessory Function Switch Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

DTC B3588: REAR FOG LAMP SWITCH CIRCUIT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B3588 00

Rear Fog Lamp Switch Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Rear Fog Lamp Switch Signal	B3588 00	1	1	-
Rear Fog Lamp Control	B2540 02	B2540 04	1	-
Rear Fog Lamp Ground	-	1	-	-
Headlamp Switch Ground	-	1	-	-
1. Rear Fog Lamp Malfunction				

Circuit/System Description

The rear fog lamp switch signal circuit is grounded momentarily by pressing the rear fog lamp switch. The body control module (BCM) responds to the rear fog lamp request by applying voltage to the rear fog lamp control circuit which illuminates the rear fog lamp.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the headlamp switch rear fog lamp signal circuit.

Actions Taken When the DTC Sets

The rear fog lamp indicator on the instrument cluster is always ON.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S30 Headlamp Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 15 Ω between the ground circuit terminal 8 and ground.
   - **If 15 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 15 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Rear Fog Lamp Switch parameter is Inactive.
   - **If not Inactive**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit terminal 6 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 6 and ground.
6. Verify the scan tool Rear Fog Lamp Switch parameter is Active.
   - **If not Active**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit terminal 6 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If Active**
7. Test or replace the S30 Headlamp Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

DTC B3596: HAZARD LAMPS REQUEST CIRCUIT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B3596 00

Hazard Lamps Request Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Hazard Warning Switch Signal	B3596 00	1	1	-
Multifunction Switch 1 - Instrument Panel Ground	-	1	-	-
1. Hazard Lamps Malfunction				

Circuit/System Description

The hazard flashers may be activated in any power mode. The hazard warning switch signal circuit is momentarily grounded when the hazard warning switch is pressed. The body control module (BCM) responds to the hazard warning switch signal input by supplying battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard warning switch is activated, the BCM sends a serial data message to the instrument cluster requesting both turn signal indicators to be cycled ON and OFF.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Hazard lamps ON.

Conditions for Setting the DTC

The hazard warning switch input is Active for longer than 60 s.

Actions Taken When the DTC Sets

The hazard lamps are inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

DTC B3600: PASSENGER COMPARTMENT DIMMING REQUEST SIGNAL CIRCUIT LOW/HIGH VOLTAGE

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptors

DTC B3600 03

Passenger Compartment Dimming Request Signal Circuit Low Voltage

DTC B3600 07

Passenger Compartment Dimming Request Signal Circuit High Voltage

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Headlamp Switch B+	B1395 03, B3600 03	B3600 03	B1395 07, B3600 07	-
Headlamp Switch Signal	B1395 03, B3600 03	B3600 03	B1395 07, B3600 07	-
Headlamp Switch Low Reference	1	1	1	-
1. Interior Backlighting Malfunction				

Circuit/System Description

The instrument panel dimmer switch is used to increase and decrease the brightness of the interior backlighting components. The instrument panel dimmer switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides B+, low reference, and signal circuits to the instrument panel dimmer switch. When the instrument panel dimmer switch is placed in the desired position, the dimmed voltage setting is applied from the instrument panel dimmer switch through the instrument panel dimmer switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Park lamps ON.

Conditions for Setting the DTC

DTC B3600 03

- The BCM detects a short to ground or an open/high resistance in the instrument panel dimmer switch B+ reference circuit.
- The BCM detects a short to ground or an open/high resistance in the instrument panel dimmer switch signal circuit.

DTC B3600 07

- The BCM detects a short to voltage in the instrument panel dimmer switch B+ reference circuit.
- The BCM detects a short to voltage in the instrument panel dimmer switch signal circuit.

Actions Taken When the DTC Sets

All interior backlighting defaults to FULL bright.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S30 Headlamp Switch, vehicle in Service Mode.
2. Test for B+ between the B+ circuit terminal 12 and ground.
    - **If less than B+**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If B+**
3. Test for B+ between the B+ circuit terminal 12 and the low reference circuit terminal 7.
    - **If less than B+**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the low reference circuit terminal 7 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If B+**
4. Verify a test lamp does not illuminate between the B+ circuit terminal 12 and the signal circuit terminal 11.

- **If the test lamp illuminates**
  1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
  2. Test for infinite resistance between the signal circuit and ground.
     - If less than infinite resistance, repair the short to ground on the circuit.
     - If infinite resistance, replace the K9 Body Control Module.
- **If the test lamp does not illuminate**

5. Test for B+ between the B+ circuit terminal 12 and the signal circuit terminal 11.
   - **If less than B+**
     1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
     2. Test for less than 1 V between the signal circuit terminal 11 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
     3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
   - **If B+**
6. Test or replace the S30 Headlamp Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Headlamp Switch Replacement**
- Refer to **Control Module References** for BCM replacement, programming and setup

DTC B3650: HIGH BEAM REQUEST SIGNAL CIRCUIT PERFORMANCE - SIGNAL INVALID

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B3650 08

High Beam Request Signal Circuit Performance - Signal Invalid

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Turn Signal/Multifunction Switch High Beam Signal	B3650 08	1	1	-
Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Headlamps Malfunction				

Circuit/System Description

For headlamp operation, the body control module (BCM) monitors three signal circuits from the turn signal/multifunction switch. When the turn signal/multifunction switch is in the AUTO position, the three signal circuits are open and the BCM relies on the ambient light sensor input to turn the headlamps and daytime running lamps (DRLs) ON and OFF. When the turn signal/multifunction switch is placed in the OFF position, the turn signal/multifunction switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the turn signal/multifunction switch in the PARK LAMPS position, the turn signal/multifunction switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the turn signal/multifunction switch is in the HEADLAMP position, both the turn signal/multifunction switch park lamps ON signal circuit and the turn signal/multifunction switch headlamps ON signal circuit are grounded. The BCM responds by commanding the park lamps and headlamps ON.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the turn signal/multifunction switch high beam signal circuit.

Actions Taken When the DTC Sets

The high beam headlamps will not operate.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

DTC B3806: HIGH BEAM AND HEADLAMP FLASH SELECT CIRCUIT MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC B3806 00

High Beam and Headlamp Flash Select Circuit Malfunction

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Turn Signal/Multifunction Switch Flash To Pass Signal	B3806 00	1	1	-
Turn Signal/Multifunction Switch Ground	-	1	-	-
1. Headlamps Malfunction				

Circuit/System Description

When the turn signal/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the body control module (BCM) through the flash to pass signal circuit. The BCM responds to the flash to pass request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the high beam fuses to the high beam control circuits illuminating the high beam headlamps. The high beam headlamps will only illuminate for as long at the flash to pass switch is activated.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

The BCM detects a short to ground in the turn signal/multifunction switch flash to pass signal circuit.

Actions Taken When the DTC Sets

The high beam lamps and the high beam indicator on the instrument panel cluster are always ON with the headlamp switch in the HEAD position.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

    2. Test for less than 1 V between the signal circuit terminal 6 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**
7. Test or replace the S78 Turn Signal/Multifunction Switch.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Turn Signal Switch Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

DTC B3881 OR B3882: LEFT/RIGHT TAIL LAMP CIRCUIT (MBM)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Left Tail Lamp Control	B3881 02	B3881 04	-	-
Right Tail Lamp Control	B3882 02	B3882 04	-	-
Left Tail/Stop Lamp Ground	-	1	-	-
Right Tail/Stop Lamp Ground	-	1	-	-
1. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

When the headlamp switch is placed in either the park or low beam position, ground is applied from the park lamp signal circuit to the body control module (BCM). The BCM sends this message to the trailer lighting control module. The trailer lighting control module responds by applying battery voltage to the left and right tail lamp control circuits, illuminating the left and right tail lamps.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Tail lamps ON.

Conditions for Setting the DTC

DTC B3881 02

The trailer lighting control module detects a short to ground in the left tail lamp control circuit.

DTC B3881 04

The trailer lighting control module detects an open in the left tail lamp control circuit.

DTC B3882 02

The trailer lighting control module detects a short to ground in the right tail lamp control circuit.

DTC B3882 04

The trailer lighting control module detects an open in the right tail lamp control circuit.

Actions Taken When the DTC Sets

The appropriate tail lamp is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists and the ignition is cycled.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

DTC B3881

1. Vehicle OFF, exterior lamps OFF, disconnect the X910 harness connector at the E42L Tail Lamp Assembly - Left.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 1 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the Left Rear Stop/Park Lamp ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K68 Trailer Lighting Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K68 Trailer Lighting Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the E42L Tail Lamp Assembly - Left.

DTC B3882

1. Vehicle OFF, exterior lamps OFF, disconnect the X920 harness connector at the E42R Tail Lamp Assembly - Right.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

    - If less than 2 Ω, repair the open/high resistance in the ground connection.
  - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 1 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the Right Rear Stop/Park Lamp ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K68 Trailer Lighting Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K68 Trailer Lighting Control Module.
   - **If the test lamp turns ON and OFF**
5. Test or replace the E42R Tail Lamp Assembly - Right.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Tail Lamp Control Module Replacement
- Refer to Rear Combination Lamp Replacement
- Refer to Control Module References for trailer lighting control module replacement, programming, and setup

DTC B3881 OR B3882: LEFT/RIGHT TAIL LAMP CIRCUIT (MAH/MBC/MAW/MCX)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

1. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

When the headlamp switch is placed in either the park or low beam position, ground is applied from the park lamp signal circuit to the body control module (BCM). The BCM sends this message to the trailer interface control module. The trailer interface control module responds by applying battery voltage to the left and right tail lamp control circuits, illuminating the left and right tail lamps.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Tail lamps ON.

Conditions for Setting the DTC

DTC B3881 02

The trailer interface control module detects a short to ground in the left tail lamp control circuit.

DTC B3881 04

The trailer interface control module detects an open in the left tail lamp control circuit.

DTC B3882 02

The trailer interface control module detects a short to ground in the right tail lamp control circuit.

DTC B3882 04

The trailer interface control module detects an open in the right tail lamp control circuit.

Actions Taken When the DTC Sets

The appropriate tail lamp is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists and the ignition is cycled.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

DTC B3881

1. Vehicle OFF, exterior lamps OFF, disconnect the X910 harness connector at the E42L Tail Lamp Assembly - Left.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 1 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the Left Rear Stop/Park Lamp ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K101 Trailer Interface Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K101 Trailer Interface Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the E42L Tail Lamp Assembly - Left.

DTC B3882

1. Vehicle OFF, exterior lamps OFF, disconnect the X920 harness connector at the E42R Tail Lamp Assembly - Right.
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.

        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**

3. Connect a test lamp between the control circuit terminal 1 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the Right Rear Stop/Park Lamp ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K101 Trailer Interface Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K101 Trailer Interface Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the E42R Tail Lamp Assembly - Right.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Tail Lamp Control Module Replacement**
- Refer to **Rear Combination Lamp Replacement**

License Plate Lamp - Right Ground	-	1	-	-
License Plate Lamp - Left Ground	-	1	-	-
1. Park, License, and/or Tail Lamps Malfunction				

Circuit/System Description

When the turn signal/multifunction switch is placed in the HEAD or PARK position, ground is applied to the park lamp switch ON signal circuit to the body control module (BCM). The BCM responds by applying voltage to the park lamps and license lamps control circuits illuminating the park and license lamps.

Conditions for Running the DTC

DTC B3883 01

Turn signal/multifunction switch in OFF position.

DTC B3883 02 and B3883 04

Turn signal/multifunction switch in AUTO, PARK or ON positions.

Conditions for Setting the DTC

DTC B3883 01

The BCM detects a short to voltage in the license plate lamp control circuit.

DTC B3883 02

The BCM detects a short to ground in the license plate lamp control circuit.

DTC B3883 04

The BCM detects an open/high resistance in the license plate lamp control circuit.

Actions Taken When the DTC Sets

DTC B3883 01

License plate lamps always ON.

DTC B3883 02 and B3883 04

License plate lamps inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

1. Vehicle OFF, exterior lamps OFF, remove both E7 License Plate Lamp bulbs.
2. Test for less than 5 Ω between each ground circuit terminal 2 and ground.
    - **If 5 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
3. Connect a test lamp between the E7L License Plate Lamp - Left control circuit terminal 1 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
5. Vehicle OFF.
6. Connect a test lamp between the E7R License Plate Lamp - Right control circuit terminal 1 and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.

    - If less than infinite resistance, repair the short to ground on the circuit.
    - If infinite resistance
  3. Test for less than 2 Ω in the control circuit end to end.
    - If 2 Ω or greater, repair the open/high resistance in the circuit.
- **If the test lamp turns ON and OFF**

8. Test or replace the E7 License Plate Lamp bulb.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Rear License Plate Lamp Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

DTC B3884: CENTER HIGH MOUNTED STOP LAMP CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Center High Mounted Stop Lamp Control	B3884 02	1	1	-
Center High Mounted Stop Lamp Ground	-	1	-	-
1. Stop Lamps Malfunction				

Circuit/System Description

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp control circuit illuminating the left and right stop lamps and the center high mounted stop lamp.

Conditions for Running the DTC

- Battery voltage must be between 9-16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

DTC B3884 01

The BCM detects a short to voltage in the center high mounted stop lamp control circuit.

DTC B3884 02

The BCM detects a short to ground in the center high mounted stop lamp control circuit.

DTC B3884 04

The BCM detects an open/high resistance in the center high mounted stop lamp control circuit.

Actions Taken When the DTC Sets

DTC B3884 01

Center high mounted stop lamp always ON.

DTC B3884 02 and B3884 04

Center high mounted stop lamp inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Auxiliary Right Tail/Stop Lamp Ground	-	1	-	-
1. Stop Lamps Malfunction				

Circuit/System Description

The brake pedal position sensor provides an analog voltage signal to the BCM. The BCM sends this message to the trailer lighting control module. The trailer lighting control module responds by applying battery voltage to the left and right stop lamp control circuits, illuminating the left and right stop lamps. When the liftgate is in the CLOSED position, the trailer lighting control module will illuminate the left and right stop lamps. When the liftgate is in the OPEN position, the trailer lighting control module will illuminate the left and right auxiliary stop lamps.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Brake pedal applied.
- Liftgate OPEN.

Conditions for Setting the DTC

DTC B388B 02

The trailer lighting control module detects a short to ground in the left auxiliary tail/stop lamp control circuit.

DTC B388B 04

The trailer lighting control module detects an open in the left auxiliary tail/stop lamp control circuit.

DTC B388C 02

The trailer lighting control module detects a short to ground in the right auxiliary tail/stop lamp control circuit.

DTC B388C 04

The trailer lighting control module detects an open in the right auxiliary tail/stop lamp control circuit.

Actions Taken When the DTC Sets

The appropriate auxiliary tail/stop lamp is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists and the ignition is cycled.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

DTC B388B

1. Vehicle OFF, exterior lamps OFF, disconnect the X410 harness connector at the E51L Tail Lamp Assembly - Auxiliary Left.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 2 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF while pressing and releasing the brake pedal, liftgate OPEN.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K68 Trailer Lighting Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K68 Trailer Lighting Control Module.
   - **If the test lamp turns ON and OFF**
5. Test or replace the E5LC Tail/Stop Lamp - Auxiliary Left.

DTC B388C

1. Vehicle OFF, exterior lamps OFF, disconnect the X420 harness connector at the E51R Tail Lamp Assembly - Auxiliary Right.

2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 2 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF while pressing and releasing the brake pedal, liftgate OPEN.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K68 Trailer Lighting Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K68 Trailer Lighting Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the E5RC Tail/Stop Lamp - Auxiliary Right.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Tail Lamp Control Module Replacement**
- Refer to **Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea with Rear Fog) Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea, North America with Back-up Bulb)**
- Refer to **Control Module References** for trailer lighting control module replacement, programming, and setup

DTC B388B OR B388C: AUXILIARY LEFT/RIGHT TAIL AND STOP LAMP CIRCUIT (MAH/MBC/MAW/MCX)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Auxiliary Left Tail/Stop Lamp Ground	-	1	-	-
Auxiliary Right Tail/Stop Lamp Ground	-	1	-	-
1. Stop Lamps Malfunction				

Circuit/System Description

The brake pedal position sensor provides an analog voltage signal to the BCM. The BCM sends this message to the trailer interface control module. The trailer interface control module responds by applying battery voltage to the left and right stop lamp control circuits, illuminating the left and right stop lamps. When the liftgate is in the CLOSED position, the trailer interface control module will illuminate the left and right stop lamps. When the liftgate is in the OPEN position, the trailer interface control module will illuminate the left and right auxiliary stop lamps.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Brake pedal applied.
- Liftgate OPEN.

Conditions for Setting the DTC

DTC B388B 02

The trailer interface control module detects a short to ground in the left auxiliary tail/stop lamp control circuit.

DTC B388B 04

The trailer interface control module detects an open in the left auxiliary tail/stop lamp control circuit.

DTC B388C 02

The trailer interface control module detects a short to ground in the right auxiliary tail/stop lamp control circuit.

DTC B388C 04

The trailer interface control module detects an open in the right auxiliary tail/stop lamp control circuit.

Actions Taken When the DTC Sets

The appropriate auxiliary tail/stop lamp is inoperative.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists and the ignition is cycled.
- A history DTC will clear once 100 consecutive malfunction-free ignition cycles have occurred.

Circuit/System Testing

DTC B388B

1. Vehicle OFF, exterior lamps OFF, disconnect the X410 harness connector at the E51L Tail Lamp Assembly - Auxiliary Left.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 2 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF while pressing and releasing the brake pedal, liftgate OPEN.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K101 Trailer Interface Control Module.
    - **If the test lamp is always ON**

    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K101 Trailer Interface Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the E5LC Tail/Stop Lamp - Auxiliary Left.

DTC B388C

1. Vehicle OFF, exterior lamps OFF, disconnect the X420 harness connector at the E51R Tail Lamp Assembly - Auxiliary Right.
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 2 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF while pressing and releasing the brake pedal, liftgate OPEN.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K101 Trailer Interface Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K101 Trailer Interface Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the E5RC Tail/Stop Lamp - Auxiliary Right.

1. Turn Signal Lamps and/or Indicators Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the vehicle ON/OFF switch in the SERVICE MODE or ON positions. When the turn signal/multifunction switch is placed in either the turn right or turn left position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the

BCM, a serial data message is sent to the instrument panel requesting the respective turn signal indicator be pulsed ON and OFF.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

DTC B3948 01

The BCM detects a short to voltage in the left front turn signal control circuit.

DTC B3948 01 and B3948 04

- The BCM detects a short to ground or an open/high resistance in the F43DA (BCM 7) fuse B+ circuit.
- The BCM detects an open/high resistance in the left front turn signal control circuit.

DTC B3948 02

The BCM detects a short to ground in the left front turn signal control circuit.

DTC B3949 01

The BCM detects a short to voltage in the left front turn signal control circuit.

DTC B3949 01 and B3949 04

- The BCM detects a short to ground or an open/high resistance in the F7DA (BCM 3) fuse B+ circuit.
- The BCM detects an open/high resistance in the right front turn signal control circuit.

DTC B3949 02

The BCM detects a short to ground in the right front turn signal control circuit.

Actions Taken When the DTC Sets

DTC B3948

- The left front turn signal is inoperative.
- The left turn signal indicator on the instrument cluster flashes rapidly.
- The driver information center displays "Left Front Turn Indicator Failure".

DTC B3949

- The right front turn signal is inoperative.
- The right turn signal indicator on the instrument cluster flashes rapidly.
- The driver information center displays "Right Front Turn Indicator Failure".

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

DTC B3948

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Exterior lamps OFF, disconnect the harness connector at the appropriate left front turn signal listed below.
   - E4LF Turn Signal Lamp - Left Front
   - A9A Outside Rearview Mirror - Driver
5. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
   - E4LF Turn Signal Lamp - Left Front terminal 2
   - A9A Outside Rearview Mirror - Driver terminal 5
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
   - E4LF Turn Signal Lamp - Left Front terminal 1

   - A9A Outside Rearview Mirror - Driver terminal 6

7. Verify the test lamp turns ON and OFF when commanding the Left Front Turn Signal Lamp ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
8. Test or replace the appropriate left front turn signal lamp.

DTC B3949

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
3. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
4. Exterior lamps OFF, disconnect the harness connector at the appropriate right front turn signal listed below.
   - E4RF Turn Signal Lamp - Right Front
   - A9B Outside Rearview Mirror - Passenger
5. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
   - E4RF Turn Signal Lamp - Right Front terminal 2
   - A9B Outside Rearview Mirror - Passenger terminal 5
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**

6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
    - E4RF Turn Signal Lamp - Right Front terminal 1
    - A9B Outside Rearview Mirror - Passenger terminal 6
7. Verify the test lamp turns ON and OFF when commanding the Right Front Turn Signal Lamp ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
8. Test or replace the E4RF Turn Signal Lamp - Right Front.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Front Turn Signal Lamp Bulb Replacement**
- Refer to **Outside Rearview Mirror Turn Signal Lamp Replacement**
- Refer to **Control Module References** for BCM replacement, programming and setup

DTC B3950 OR B3951: LEFT/RIGHT REAR TURN SIGNAL CIRCUIT

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

1. Turn Signal Lamps and/or Indicators Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the vehicle ON/OFF switch in the SERVICE MODE or ON positions. When the turn signal/multifunction switch is placed in either the turn right or turn left position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument panel requesting the respective turn signal indicator be pulsed ON and OFF.

Conditions for Running the DTC

Battery voltage must be between 9-16 V.

Conditions for Setting the DTC

DTC B3950 01

The BCM detects a short to voltage in the left rear turn signal control circuit.

DTC B3950 01 and B3950 04

- The BCM detects a short to ground or an open/high resistance in the F6DA (BCM 4) fuse B+ circuit.
- The BCM detects an open/high resistance in the left rear turn signal control circuit.

DTC B3950 02

The BCM detects a short to ground in the left rear turn signal control circuit.

DTC B3951 01

The BCM detects a short to voltage in the right rear turn signal control circuit.

DTC B3951 01 and B3951 04

- The BCM detects a short to ground or an open/high resistance in the F43DA (BCM 7) fuse B+ circuit.
- The BCM detects an open/high resistance in the right rear turn signal control circuit.

DTC B3951 02

The BCM detects a short to ground in the right rear turn signal control circuit.

Actions Taken When the DTC Sets

DTC B3950

- The left rear turn signal is inoperative.
- The left turn signal indicator on the instrument cluster flashes rapidly.
- The driver information center displays "Left Rear Turn Indicator Failure".

DTC B3951

- The right rear turn signal is inoperative.
- The right turn signal indicator on the instrument cluster flashes rapidly.
- The driver information center displays "Right Rear Turn Indicator Failure".

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 100 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Circuit/System Testing

DTC B3950

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**

   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If the test lamp illuminates**

3. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
4. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the E4LR Turn Signal Lamp - Left Rear.
5. Test for less than 10 Ω between the ground circuit at the socket terminal and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
6. Connect a test lamp between the control circuit at the socket terminal and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the Left Rear Turn Signal Lamp ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
8. Test or replace the E4LR Turn Signal Lamp - Left Rear.

DTC B3951

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the E4RR Turn Signal Lamp - Right Rear.
5. Test for less than 10 Ω between the ground circuit at the socket terminal and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
6. Connect a test lamp between the control circuit at the socket terminal and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the Right Rear Turn Signal Lamp ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
8. Test or replace the E4RR Turn Signal Lamp - Right Rear.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea with Rear Fog) Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea, North America with Back-up Bulb)
- Refer to Rear Fascia Lower Signal Lamp Replacement
- Refer to Control Module References for BCM replacement, programming and setup

DTC C0277 OR C0890: BRAKE PEDAL POSITION SENSOR CIRCUIT/CONTROL MODULE VOLTAGE REFERENCE OUTPUT 3 CIRCUIT

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.

- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Brake Pedal Position Sensor Signal	C0277 06, U0422 71	C0277 06, U0422 71	C0277 07, C0890 07, U0422 71	C0277 09
Brake Pedal Position Sensor Low Reference	-	C0277 07, U0422 71	1	-
1. Stop Lamps Malfunction				

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the left and right stop lamp control circuits as well as the center high mounted stop lamp (CHMSL) control circuit illuminating the left and right stop lamps and the CHMSL.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

DTC C0277 06

- The BCM detects a short to ground or an open/high resistance in the BPP sensor 5 V reference circuit.
- The BCM detects a short to ground or an open/high resistance in the BPP sensor signal circuit.

DTC C0277 07

- The BCM detects an open/high resistance in the BPP sensor low reference circuit.
- The BCM detects a short to voltage in the BPP sensor signal circuit.

DTC C0277 09

The BCM detects the BPP sensor signal is changing faster than possible under normal operating conditions.

DTC C0277 4B

The DTC will set when the BPP sensor home position is not learned.

DTC C0890 03

- The BCM detects a short to ground in the BPP sensor 5 V reference circuit.

DTC C0890 07

- The BCM detects a short to voltage in the BPP sensor 5 V reference circuit.
- The BCM detects a short to voltage in the BPP sensor signal circuit.

Actions Taken When the DTC Sets

DTC C0277 06 or C0890 03

- The vehicle will not start with a short to ground or an open/high resistance on the BPPS 5 V reference circuit or the BPPS signal circuit.

DTC C0277 07 or C0890 07

The vehicle will not start with a short to voltage on the BPPS 5 V reference circuit or the BPPS signal circuit.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- For DTC C0277 4B a successful brake pedal position sensor calibration has been performed.
- A history DTC will clear once 50 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.
- A DTC will not clear the current status until the next ignition cycle.

Circuit/System Testing

DTC C0277 06, C0277 07, C0890 03, and C0890 07

1. Vehicle OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor, vehicle in Service Mode.
2. Test for B+ between the low reference circuit terminal 2 and B+.
   - **If less than B+**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
   2. Test for less than 2 Ω in the low reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If B+**
3. Test for 4.8 - 5.2 V between the 5 V reference circuit terminal 1 and ground.
   - **If less than 4.8 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the 5 V reference circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the 5 V reference circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If greater than 5.2 V**
   1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the 5 V reference circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If between 4.8 - 5.2 V**
4. Verify the scan tool Brake Pedal Applied parameter is Inactive.
   - **If not Inactive**
   1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit terminal 3 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If Inactive**
5. Install a 3 A fused jumper wire between the 5-volt reference circuit terminal 1 and the signal circuit terminal 3.
6. Verify the scan tool Brake Pedal Applied parameter is Active.
   - **If not Active**
   1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**
7. Test or replace the B22 Brake Pedal Position Sensor.

DTC C0277 4B

1. Verify DTC C0277 4B is not set.
    - **If DTC C0277 4B is set**
    1. Vehicle in Service Mode.
    2. Perform the BPP sensor recalibration procedure for the K9 Body Control Module. Refer to **Brake Pedal Position Sensor Calibration** .
    3. Verify the DTC does not reset while operating the vehicle under the conditions for running the DTC.
        - If the DTC resets, replace the B22 Brake Pedal Position Sensor.
        - If the DTC does not reset
    4. All OK.
    - **If DTC C0277 4B is not set**
2. All OK.

DTC C0277 09

1. Verify DTC C0277 09 is not set.
    - **If DTC C0277 09 is set**
    1. Replace the B22 Brake Pedal Position Sensor.
    2. Perform the BPP sensor recalibration procedure for the K9 Body Control Module. Refer to **Brake Pedal Position Sensor Calibration** .
    3. Verify the DTC does not reset while operating the vehicle under the conditions for running the DTC.
        - If the DTC resets, replace the K9 Body Control Module.
        - If the DTC does not reset
    4. All OK.
    - **If DTC C0277 09 is not set**
2. All OK.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Brake Pedal Position Sensor Calibration**
- Refer to **Brake Pedal Position Sensor Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

DTC C0297: BRAKE APPLIED OUTPUT CIRCUIT SHORT TO GROUND

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

DTC Descriptor

DTC C0297 02

Brake Applied Output Circuit Short to Ground

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Brake Applied Signal	C0297 02	1	1	-
1. Cruise Control Malfunction				

Circuit/System Description

The brake pedal position sensor is used to sense the action of the driver application of the brake pedal. The brake pedal position sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5 V reference voltage to the brake pedal position sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the right and left stop lamp control circuits, engine control module (ECM), and center high mounted stop lamp control circuit.

Conditions for Running the DTC

- Battery voltage must be between 9 - 16 V.
- Brakes APPLIED.

Conditions for Setting the DTC

The BCM detects a short to ground or an open/high resistance on the brake applied signal circuit.

Actions Taken When the DTC Sets

The cruise control system is disabled.

Conditions for Clearing the DTC

- The condition responsible for setting the DTC no longer exists.
- A history DTC will clear once 50 consecutive malfunction-free vehicle ON/OFF switch cycles have occurred.

Diagnostic Aids

Verify that the brake pedal position sensor is properly calibrated.

Circuit/System Testing

1. Vehicle OFF, disconnect the X1 harness connector at the K20 Engine Control Module.
2. Connect a test lamp between the signal circuit terminal 20 and ground, ignition ON.
3. Verify the test lamp turns ON and OFF while pressing and releasing the brake pedal.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
4. Replace the K20 Engine Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Brake Pedal Position Sensor Calibration**
- Refer to **Control Module References** for BCM or ECM replacement, programming, and setup

SYMPTOMS - LIGHTING

NOTE: **The following steps must be completed before using a symptom table.**

- Perform the **Diagnostic System Check - Vehicle** before using a symptom table in order to verify that all of the following conditions are true:
    - There are no DTCs set.
    - The control modules can communicate via the serial data link.
- Review the system description and operation in order to familiarize yourself with the system functions. Refer to the following:
    - **Exterior Lighting Systems Description and Operation**
    - **Interior Lighting Systems Description and Operation**

Visual/Physical Inspection

- Inspect for aftermarket devices which could affect the operation of the lighting system. Refer to **Checking Aftermarket Accessories** .
- Inspect the easily accessible or visible system components for obvious damage or conditions which could cause the symptom.

Intermittent

Thoroughly inspect the wiring and connectors. An incomplete inspection of the wiring and connectors may result in misdiagnosis causing part replacement with the reappearance of the malfunction. If an intermittent malfunction exists, refer to **Testing for Intermittent Conditions and Poor Connections** .

Symptom List

Refer to a symptom diagnostic procedure from the following list in order to diagnose the symptom:

- **Backup Lamps Malfunction**
- **Courtesy Lamps Malfunction**
- **Daytime Running Lamps Malfunction**
- **Dome Lamps Malfunction**

BACKUP LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F17DA (BCM 6) Fuse B+	1	1	-	-
Backup Lamp Control	B2545 02	1	1	-
Backup Lamp Ground	-	1	-	-
1. Backup Lamps Malfunction				

Circuit/System Description

With the vehicle ON and the transmission in the reverse position, the transmission control module (TCM) sends a serial data message to the body control module (BCM). The message indicates that the gear selector is in the reverse position. The BCM applies battery voltage to the backup lamp control circuit illuminating the backup lamp. Once the driver moves the gear selector out of the reverse position, a message is sent by the TCM via serial data requesting the BCM to remove battery voltage from the backup lamp control circuit. The vehicle must be ON for the backup lamps to operate.

Circuit/System Testing

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the E5 Backup Lamp.
5. Test for less than 5 Ω between the ground circuit at the socket terminal and ground.
    - **If 5 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
6. Connect a test lamp between the control circuit at the socket terminal and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the Backup Lamps ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**

        1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
        2. Test for less than 1 V between the control circuit terminal and ground.
            - If 1 V or greater, repair the short to voltage on the circuit.
            - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**

8. Test or replace the E5 Backup Lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea with Rear Fog) Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea, North America with Back-up Bulb)**
- Refer to **Control Module References** for BCM replacement, programming, and setup

COURTESY LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F17DA (BCM 6) Fuse B+	1	1	-	-
Courtesy Lamps Control - Terminal 2 X7	B1480 02	1	1	-
Dome/Reading Lamps - Overhead Console Ground	-	1	-	-
Dome/Reading Lamps - Rear Ground	-	1	-	-
1. Courtesy Lamps Malfunction				

Circuit/System Description

The body control module (BCM) supplies battery voltage to the front and rear reading lamps via the courtesy lamp control circuit. The front and rear reading lamps are controlled by individual switches that are activated by the operator when additional cabin lighting is required. In the event that any of these courtesy lamps were to remain illuminated for more than 10 min with the vehicle ON/OFF switch in the OFF position and no doors opened, the BCM will deactivate the courtesy lamp control circuit to prevent total battery discharge.

Diagnostic Aids

The Inadvertent Load scan tool command operates when the front and rear dome lamp switches are in the ON position.

Circuit/System Testing

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module
    - **If the test lamp illuminates**
3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connectors at the inoperative component listed below. It may take up to 2 min for all vehicle systems to power down.
    - E37D Dome/Reading Lamps - Overhead Console
    - E37R Dome/Reading Lamps - Rear
5. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
    - E37D Dome/Reading Lamps - Overhead Console terminal 4
    - E37R Dome/Reading Lamps - Rear terminal 3
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
    - E37D Dome/Reading Lamps - Overhead Console terminal 2
    - E37R Dome/Reading Lamps - Rear terminal 1
7. Verify the test lamp turns ON and OFF when commanding the Inadvertent Load ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.

    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**

8. Test or replace the appropriate courtesy lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Roof Console Replacement**
- Refer to **Center Courtesy Lamp Replacement**
- Refer to **Rear Seat Position Center Courtesy Lamp Bulb Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

DAYTIME RUNNING LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Daytime Running Lamp Control - Left	B2600 02	1	1	-
Daytime Running Lamp Control - Right	B2605 02	1	1	-
Headlamp Assembly Ground - Left	-	1	-	-
Headlamp Assembly Ground - Right	-	1	-	-
1. Daytime Running Lamps Malfunction				

Circuit/System Description

The ambient light/sunload sensor is used to monitor outside lighting conditions. The ambient light/sunload sensor provides a serial data message to the body control module (BCM) based on outside lighting conditions to determine if outside lighting conditions are correct for either daytime running lamps or automatic lamp control when the headlamp switch is in the AUTO position. In daylight conditions the BCM will command the designated daytime running lamps ON. During low light conditions the BCM will command the low beam headlamps ON. Any function or condition that turns on the headlamps will cancel daytime running lamps operation.

Diagnostic Aids

The daytime running lamps will only operate in daylight conditions with the vehicle ON and in any transmission gear except PARK.

Circuit/System Verification

1. Vehicle ON.
2. Verify the left daytime running lamp turns ON and OFF when commanding the Left Dedicated Daytime Running Lamp ON and OFF with a scan tool.
    - **If the left daytime running lamp does not turn ON and OFF**

      Refer to Daytime Running Lamp Malfunction.

    - **If the left daytime running lamp turns ON and OFF**
3. Verify the right daytime running lamp turns ON and OFF when commanding the Right Dedicated Daytime Running Lamp ON and OFF with a scan tool.
    - **If the right daytime running lamp does not turn ON and OFF**

      Refer to Daytime Running Lamp Malfunction.

    - **If the right daytime running lamp turns ON and OFF**
4. Refer to DTC U1340-U135F .

Circuit/System Testing

Daytime Running Lamp Malfunction

1. Vehicle OFF, exterior lamps OFF, disconnect the appropriate harness connector listed below.
    - X110 - left daytime running lamp
    - X120 - right daytime running lamp
2. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
    - Terminal 5 (-TR6)
    - Terminal 7 (TR6)
    - **If 10 Ω or greater**
    1. Vehicle OFF.

        2. Test for less than 2 Ω in the ground circuit end to end.
            - If 2 Ω or greater, repair the open/high resistance in the circuit.
            - If less than 2 Ω, repair the open/high resistance in the ground connection.
        - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 3 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Dedicated Daytime Running Lamp ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate E13 Headlamp Assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Headlamp Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

DOME LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Dome Lamps Control - Terminal 1 X7	B2615 02	1	1	-
Dome Lamp Switch Cancel Signal	2	2	2	-
Dome Lamp Switch ON Signal	2	2	2	-
Dome/Reading Lamps Ground - Overhead Console	-	1, 2	-	-
Dome/Reading Lamps Ground - Rear	-	1	-	-
1. Dome Lamps Malfunction 2. Dome Lamp Switch Malfunction				

Circuit/System Description

The dome lamp switch has 3 positions: DOOR, OFF, and ON. The ON position provides a ground for continuous operation and the dome lamps will remain illuminated until the switch is placed in either the DOOR or OFF position. When in the DOOR position, the dome lamps operation is controlled by the body control module (BCM). When any door is opened, the door ajar switch contacts close and the BCM receives a door-open input. The BCM illuminates the dome lamps when any door is opened or a door lock/unlock request is activated with the key fob. After all doors have been closed, the dome lamps will remain illuminated approximately 3 s after the last door closes. When the driver places the dome lamp switch in the OFF position, the dome lamps will be disabled. In the event that the dome lamps were to remain illuminated for more than 10 min with the vehicle ON/OFF switch in the OFF position and no doors opened, the BCM will deactivate the dome lamps control circuit to prevent total battery discharge.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Door Ajar Sw. parameter changes between Active and Inactive while opening and closing each vehicle door.
   - **If the parameter does not change**

     Refer to **Door Ajar Indicator Malfunction** .
   - **If the parameter changes**
3. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter changes between Door, On, and Cancel while placing the dome lamp switch in the Door, On, and Cancel positions.
   - **If the parameter does not change**

     Refer to Dome Lamp Switch Malfunction.
   - **If the parameter changes**
4. Verify the dome lamps turn ON and OFF while commanding the Courtesy Lamps ON and OFF with a scan tool.
   - **If the dome lamps do not turn ON and OFF**

     Refer to Dome Lamp Malfunction.
   - **If the dome lamps turn ON and OFF**

5. All OK.

Circuit/System Testing

Dome Lamp Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the E37D Dome/Reading Lamps - Overhead Console. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 5 Ω between the ground circuit terminal 4 and ground.
   - **If 5 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 5 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter is Door.
   - **If Cancel**
   1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit terminal 6 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If On**
   1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit terminal 5 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If Door**
5. Install a 3 A fused jumper wire between the signal circuit terminal 6 and the ground circuit terminal 4.
6. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter is Cancel.
   - **If not Cancel**
   1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit terminal 6 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If Cancel**
7. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the ground circuit terminal 4.
8. Verify the scan tool Interior/Courtesy Lighting Master Switch parameter is On.
   - **If not On**
   1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit terminal 5 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V

   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If On**
9. Test or replace the E37D Dome/Reading Lamps - Overhead Console.

Dome Lamps Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the inoperative component listed below. It may take up to 2 min for all vehicle systems to power down.
   - E37D Dome/Reading Lamps - Overhead Console
   - E37R Dome/Reading Lamps - Rear
2. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
   - E37D Dome/Reading Lamps - Overhead Console terminal 4
   - E37R Dome/Reading Lamps - Rear terminal 3
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuits end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
   - E37D Dome/Reading Lamps - Overhead Console terminal 3
   - E37R Dome/Reading Lamps - Rear terminal 4
4. Verify the test lamp turns ON and OFF when commanding the Courtesy Lamps ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
5. Test or replace the inoperative E37 Dome/Reading Lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Roof Console Replacement**
- Refer to **Center Courtesy Lamp Replacement**
- Refer to **Rear Seat Position Center Courtesy Lamp Bulb Replacement**

- Refer to Control Module References for BCM replacement, programming, and setup

REAR FOG LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
Rear Fog Lamp Switch Signal	B3588 00	2	2	-
Rear Fog Lamps Control	B2540 02	B2540 04	1	-
Rear Fog Lamp Ground	-	1	-	-
Headlamp Switch Ground	-	2	-	-
1. Rear Fog Lamp Malfunction 2. Rear Fog Lamp Switch Malfunction				

Circuit/System Description

The rear fog lamp switch signal circuit is grounded momentarily by pressing the rear fog lamp switch. The body control module (BCM) responds to the rear fog lamp request by applying voltage to the rear fog lamp control circuit which illuminates the rear fog lamp.

Circuit/System Verification

1. Vehicle in Service Mode, headlamps ON.
2. Verify the scan tool Rear Fog Lamps Switch parameter changes between Active and Inactive while commanding the rear fog lamp ON and OFF with the rear fog lamp switch.
   - **If the parameter does not change**

     Refer to Rear Fog Lamp Switch Malfunction.

  - **If the parameter changes**
3. Verify the rear fog lamp turns ON and OFF when commanding the Rear Fog Lamp(s) Relay ON and OFF with a scan tool.
   - **If the rear fog lamp does not turn ON and OFF**

     Refer to Rear Fog Lamp Malfunction.

   - **If the rear fog lamp turns ON and OFF**
4. Verify the rear fog lamp indicator on the instrument cluster turns ON and OFF while commanding the rear fog lamp ON and OFF with the rear fog lamp switch.
   - **If the rear fog lamp indicator does not turn ON and OFF**

     Refer to Rear Fog Lamp Indicator Malfunction.

   - **If the rear fog lamp indicator turns ON and OFF**
5. All OK.

Circuit/System Testing

Rear Fog Lamp Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S30 Headlamp Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 15 Ω between the ground circuit terminal 8 and ground.
   - **If 15 Ω or greater**
     1. Vehicle OFF.
     2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 15 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Rear Fog Lamp Switch parameter is Inactive.
   - **If not Inactive**
     1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
     2. Test for infinite resistance between the signal circuit terminal 6 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
   - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 6 and ground.
6. Verify the scan tool Rear Fog Lamp Switch parameter is Active.
   - **If not Active**
     1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
     2. Test for less than 1 V between the signal circuit terminal 6 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
     3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
   - **If Active**
7. Test or replace the S30 Headlamp Switch.

Rear Fog Lamp Malfunction

1. Vehicle OFF, exterior lamps OFF, disconnect the X410 harness connector at the E5EA Tail Lamp - Auxiliary Left.
2. Test for less than 5 Ω between the ground circuit terminal 6 and ground.
    - **If 5 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 5 Ω**
3. Connect a test lamp between the control circuit terminal 4 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the Rear Fog Lamp(s) Relay ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the E5EA Tail Lamp - Auxiliary Left.

Rear Fog Lamp Indicator Malfunction

1. Vehicle in Service Mode.
2. Verify the rear fog lamp indicator turns ON and OFF when commanding the Instrument Cluster All Indicators Test ON and OFF with a scan tool.
    - **If the rear fog lamp indicator is always OFF or remains ON**

      Replace the P16 Instrument Cluster.

    - **If the rear fog lamp indicator turns ON and OFF**
3. Replace the K9 Body Control Module.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Headlamp Switch Replacement
- Refer to Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea with Rear Fog) Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea, North America with Back-up Bulb)
- Refer to Control Module References for BCM and instrument cluster replacement, programming, and setup

HAZARD LAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F9DA (BCM 1) Fuse B+	B1325 03, U156D 00	B1325 03, U156D 00	-	-
Hazard Warning Switch Signal	B3596 00	1	1	-
Hazard Warning Switch LED Backlighting Control	2	2	2	-
Multifunction Switch 1 - Instrument Panel Ground	-	1	-	-
1. Hazard Lamps Malfunction 2. Hazard Warning Switch Backlighting Malfunction				

Circuit/System Description

The hazard flashers may be activated in any power mode. The hazard warning switch signal circuit is momentarily grounded when the hazard warning switch is pressed. The body control module (BCM) responds to the hazard warning switch signal input by supplying battery voltage to all four turn signal lamps in an ON and OFF duty cycle. When the hazard warning switch is activated, the BCM sends a serial data message to the instrument cluster requesting both turn signal indicators to be cycled ON and OFF.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Hazard Lamps Switch parameter changes between Active and Inactive while commanding the hazard lamps ON and OFF with the hazard warning switch.
   - **If the parameter does not change**

     Refer to Hazard Warning Switch Malfunction.

    - **If the parameter changes**

3. Verify all left and right turn signal lamps turn ON and OFF while commanding the hazard lamps ON and OFF with the hazard warning switch.
    - **If all turn signal lamps do not turn ON and OFF**

      Refer to **Turn Signal Lamps and/or Indicators Malfunction**

    - **If all turn signal lamps turn ON and OFF**
4. Verify the hazard lamps switch backlighting turns ON and OFF while commanding the hazard lamps ON and OFF with the hazard warning switch.
    - **If the hazard warning switch backlighting does not turn ON and OFF**

      Refer to Hazard Warning Switch Backlighting Malfunction.

    - **If the hazard warning switch backlighting turns ON and OFF**
5. All OK.

Circuit/System Testing

Hazard Warning Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S48C Multifunction Switch 1 - Instrument Panel. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Hazard Lamps Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 1 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 1 and the ground terminal 10.
6. Verify the scan tool Hazard Lamps Switch parameter is Active.
    - **If not Active**
    1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal 1 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**
7. Test or replace the S48C Multifunction Switch 1 - Instrument Panel.

Hazard Warning Switch Backlighting Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module
    - **If the test lamp illuminates**
3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
4. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S48C Multifunction Switch 1 - Instrument Panel. It may take up to 2 min for all vehicle systems to power down.
5. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
6. Vehicle in Service Mode, test for B+ between the control circuit terminal 4 and ground.
    - **If less than B+**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If B+**
7. Verify a test lamp does not illuminate between control circuit terminal 4 and ground.
    - **If the test lamp illuminates**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp does not illuminate**
8. Test or replace the S48C Multifunction Switch 1 - Instrument Panel.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Hazard Warning Switch Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

HEADLAMPS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Circuit/System Description

For headlamp operation, the body control module (BCM) monitors 3 signal circuits from the headlamp switch. When the headlamp switch is in the AUTO position, the 3 signal circuits are open and the BCM relies on the ambient light sensor input to turn the headlamps and daytime running lamps (DRLs) ON and OFF. When the headlamp switch is placed in the OFF position, the headlamp switch headlamps OFF signal circuit is grounded, indicating to the BCM that the exterior lamps should be turned OFF. With the headlamp switch in the PARK LAMPS position, the headlamp switch park lamps ON signal circuit is grounded, indicating that the park lamps have been requested. When the headlamp switch is in the HEADLAMP position, both the headlamp switch park lamps ON signal circuit and the headlamp switch headlamps ON signal circuit are grounded. The BCM responds by commanding the park lamps and headlamps ON.

The high beam and flash to pass functions are contained within the turn signal/multifunction switch. The BCM provides the turn signal/multifunction switch with 2 signal circuits, the high beam signal circuit and the flash to pass signal circuit. When the low beam headlamps are ON and the turn signal/multifunction switch is placed in the high beam position, ground is applied to the BCM through the high beam signal circuit. The BCM responds to the high beam request by applying ground to the high beam relay control circuit which energizes the high beam relay. With the high beam relay energized, the switch contacts close allowing battery voltage to flow through the left and right high beam fuses to the high beam control circuits and on to the left and right high beam solenoid actuators within the headlamp assemblies. Once the high beam solenoid actuators are active, the solenoid shutters open in each headlamp assembly exposing the remaining portion of the headlamp that was covered by the shutters illuminating the high beams at full intensity.

When the turn signal/multifunction switch is momentarily placed in the flash to pass position, ground is applied to the BCM through the flash to pass signal circuit. The BCM responds by applying ground to the high beam relay control circuit which energizes the high beam relay illuminating the high beams for a brief moment or until the flash to pass switch is released.

The automatic high beam assist system operates the high beam headlamps ON and OFF automatically when the system is activated and certain conditions are met. The automatic high beam assist system consists of a front camera module that detects light and is able to identify approaching vehicles on an even, straight road at a distance of greater than 0.4 km (0.25 mi). The front camera module analyzes light color, intensity, and movement. The automatic high beam assist system will turn OFF the high beam headlamps when approaching vehicle headlamps or preceding vehicle taillights are detected by the front camera module. Automatic high beam assist can be deactivated when the headlamp dimmer switch is moved from the neutral position to the high beam or flash to pass positions. Automatic high beam assist can be reactivated by operating the high beam select switch from the neutral position to the high beam position twice within 2 s.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Headlamps On Switch parameter changes between Active and Inactive while commanding the headlamps ON and OFF with the turn signal/multifunction switch.
   - **If the parameter does not change**

     Refer to Headlamp Switch Malfunction.

   - **If the parameter changes**

3. Verify the scan tool Automatic Headlamps Disable Switch parameter changes between Active and Inactive while commanding the automatic lamp control ON and OFF with the headlamp switch.
   - **If the parameter does not change**

     Refer to Headlamp Switch Malfunction.

   - **If the parameter changes**
4. Verify the scan tool Headlamps Flash Switch parameter changes between Active and Inactive while commanding the flash to pass ON and OFF with the headlamp switch.
   - **If the parameter does not change**

     Refer to Turn Signal/Multifunction Switch Malfunction.

   - **If the parameter changes**
5. Verify the scan tool High Beam Select Switch parameter changes between Active and Inactive while commanding the high beams ON and OFF with the turn signal/multifunction switch.
   - **If the parameter does not change**

     Refer to Turn Signal/Multifunction Switch Malfunction.

   - **If the parameter changes**
6. Verify the low beam headlamps turn ON and OFF when commanding the Low Beam Lamps ON and OFF with a scan tool.
   - **If the low beam headlamps do not turn ON and OFF**

     Refer to Headlamps Malfunction - Low Beam.

   - **If the low beam headlamps turn ON and OFF**
7. Low beam headlamps ON, verify the high beams turn ON and OFF when commanding the High Beams ON and OFF with a scan tool.
   - **If the high beams do not turn ON and OFF**

     Refer to Headlamps Malfunction - High Beam.

   - **If the high beams turn ON and OFF**
8. Verify the high beam indicator on the instrument cluster turns ON and OFF while commanding the All Indicators Test ON and OFF with a scan tool.
   - **If the high beam indicator does not turn ON and OFF**

     Refer to High Beam Indicator Malfunction.

   - **If the high beam indicator turns ON and OFF**
9. (TQ5 only) Verify the scan tool Auto High Beam Select Switch parameter changes between Active and Inactive while commanding the auto high beams ON and OFF with the turn signal/multifunction switch.
   - **If the parameter does not change**

     Refer to Automatic High Beam Select Switch Malfunction.

   - **If the parameter changes**
10. All OK.

Circuit/System Testing

Headlamp Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S30 Headlamp Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 8 and ground.

   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Automatic Headlamps Disable Switch parameter is Inactive.
   - **If not Inactive**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit terminal 3 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 3 and ground.
6. Verify the scan tool Automatic Headlamps Disable Switch parameter is Active.
   - **If not Active**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit terminal 3 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If Active**
7. Verify the scan tool Headlamps On Switch parameter is Inactive.
   - **If not Inactive**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit terminal 1 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If Inactive**
8. Install a 3 A fused jumper wire between the signal circuit terminal 1 and ground.
9. Verify the scan tool Headlamps On Switch parameter is Active.
   - **If not Active**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit terminal 1 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If Active**
10. Test or replace the S30 Headlamp Switch.

Turn Signal/Multifunction Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 Turn Signal/Multifunction Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool High Beam Select Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 7 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 7 and ground.
6. Verify the scan tool High Beam Select Switch parameter is Active.
    - **If not Active**
    1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal 7 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**
7. Verify the scan tool Headlamps Flash Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 6 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
8. Install a 3 A fused jumper wire between the signal circuit terminal 6 and ground.
9. Verify the scan tool Headlamps Flash Switch parameter is Active.
    - **If not Active**
    1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal 6 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**

10. Test or replace the S78 Turn Signal/Multifunction Switch.

Automatic High Beam Select Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 Turn Signal/Multifunction Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Auto High Beam Select Switch parameter is Inactive.
   - **If not Inactive**
   1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit terminal 4 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 4 and ground.
6. Verify the scan tool Auto High Beam Select Switch parameter is Active.
   - **If not Active**
   1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit terminal 4 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If Active**
7. Test or replace the S78 Turn Signal/Multifunction Switch.

Headlamps Malfunction - Low Beam

1. Vehicle OFF, disconnect the KR49 Headlamp Low Beam Relay, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 30 and ground.
   - **If the test lamp does not illuminate**

     Replace the X50A Fuse Block - Underhood.

   - **If the test lamp illuminates**
3. Verify a test lamp illuminates between the B+ circuit terminal 85 and ground.
   - **If the test lamp does not illuminate**

     Replace the X50A Fuse Block - Underhood.

   - **If the test lamp illuminates**
4. Connect a test lamp between the control circuit terminal 86 and B+, ignition ON.
5. Verify the test lamp turns ON and OFF when commanding the Low Beam Lamps ON and OFF with a scan tool.

- **If the test lamp is always OFF**

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for less than 1 V between the control circuit terminal 13 and ground.
   - If 1 V or greater, repair the short to voltage on the circuit.
   - If less than 1 V
3. Vehicle OFF.
4. Test for less than 2 Ω in the control circuit end to end.
   - If 2 Ω or greater, repair the open/high resistance in the circuit.
   - If less than 2 Ω, replace the K9 Body Control Module.

- **If the test lamp is always ON**

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module.
2. Test for infinite resistance between the control circuit terminal 13 and ground.
   - If less than infinite resistance, repair the short to ground on the circuit.
   - If infinite resistance, replace the K9 Body Control Module.

- **If the test lamp turns ON and OFF**

6. Vehicle OFF, exterior lamps OFF, connect the KR49 Headlamp Low Beam Relay.
7. Disconnect the appropriate E4 Headlamp - Low Beam.
8. Test for less than 10 Ω between the ground circuit at the socket terminal and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
9. Connect a test lamp between the control circuit at the socket terminal and ground, vehicle in Service Mode.
10. Verify the test lamp turns ON and OFF when commanding the Low Beam Lamps ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood.
    2. Test for infinite resistance between the control circuit and ground.
       - If less than infinite resistance, repair the short to ground on the circuit.
       - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
       - If 2 Ω or greater, repair the open/high resistance in the circuit.
       - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood, ignition ON.
    2. Test for less than 1 V between the control circuit terminal and ground.
       - If 1 V or greater, repair the short to voltage on the circuit.
       - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
11. Test or replace the E4 Headlamp - Low Beam.

Headlamps Malfunction - High Beam

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Test for B+ between the control circuit terminal 18 and ground.

   - **If less than B+**
   1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood.
   2. Test for infinite resistance between the control circuit terminal and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the X50A Fuse Block - Underhood.
   - **If B+**
3. Vehicle OFF, connect a 3 A fused jumper between the control circuit terminal 18 and ground.
4. Remove the left high beam fuse at the X50A Fuse Block - Underhood, vehicle in Service Mode.
5. Verify a test lamp illuminates between the left high beam fuse B+ switch control terminal and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, disconnect the X2 harness connector at the X50A Fuse Block - Underhood, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal 18 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the X50A Fuse Block - Underhood.
   - **If the test lamp illuminates**
6. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
7. Install the left high beam fuse at the X50A Fuse Block - Underhood.
8. Vehicle OFF, exterior lamps OFF, disconnect the appropriate harness connector listed below.
   - X110 - left high beam headlamp
   - X120 - right high beam headlamp
9. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
   - Terminal 6 (-TR6)
   - Terminal 8 (TR6)
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
10. Connect a test lamp between the control circuit terminal 2 and ground, vehicle in Service Mode.
11. Verify the test lamp turns ON and OFF when commanding the High Beams ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood.
    2. Test for infinite resistance between the control circuit and ground.
       - If less than infinite resistance, repair the short to ground on the circuit.
       - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
       - If 2 Ω or greater, repair the open/high resistance in the circuit.
       - If less than 2 Ω, replace the X50A Fuse Block - Underhood.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.

        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the X50A Fuse Block - Underhood.
    - **If the test lamp turns ON and OFF**

12. Test or replace the E13 Headlamp Assembly.

High Beam Indicator Malfunction

1. Vehicle in Service Mode.
2. Verify the high beam indicator turns ON and OFF when commanding the Instrument Cluster All Indicators Test ON and OFF with a scan tool.
    - **If the high beam indicator is always OFF or remains ON**

      Replace the P16 Instrument Cluster.

    - **If the high beam indicator turns ON and OFF**
3. Replace the K9 Body Control Module.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Headlamp Replacement**
- Refer to **Headlamp Switch Replacement**
- Refer to **Turn Signal Switch Replacement**
- Refer to **Relay Replacement (Attached to Wire Harness)** **Relay Replacement (Within an Electrical Center)**
- Refer to **Battery Distribution Fuse Block Replacement**
- Refer to **Control Module References** for BCM and Instrument Cluster replacement, programming, and setup

HEADLAMP LEVELING MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

1. Headlamp Leveling Malfunction				

Circuit/System Description

Each headlamp assembly contains a headlamp leveling actuator that is controlled by the headlamp leveling switch. The headlamp leveling switch is supplied with ignition voltage and ground and contains a resistor ladder with 4 positions for adjusting the headlamps up or down. When the headlamp leveling switch is activated to the desired position, voltage from the B+ ignition circuit is pulled down through the resistor ladder and the voltage is applied to the left and right headlamp leveling actuators via the headlamp leveling control circuits. The headlamp leveling actuators are supplied with B+ and ground. When the headlamp leveling switch is activated, the left and right headlamp leveling actuators respond by moving the headlamps to the desired position.

Diagnostic Aids

For testing purposes, the vehicle battery must be fully charged.

Circuit/System Testing

1. Vehicle OFF, exterior lamps OFF, disconnect the appropriate harness connector listed below. It may take up to 2 min for all vehicle systems to power down.
    - X110 - left headlamp
    - X120 - right headlamp
2. Test for less than 10 Ω between the ground circuit terminal 10 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify a test lamp illuminates between the ignition circuit terminal 5 and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the X1 harness connector at the X50A Fuse Block - Underhood.
    2. Test for infinite resistance between the ignition circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance

    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, refer to **Power Mode Mismatch** .
    - **If the test lamp illuminates**
5. Vehicle OFF, disconnect the harness connector at the S30 Headlamp Switch. It may take up to 2 min for all vehicle systems to power down.
6. Test for less than 10 Ω between the ground circuit terminal 8 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
7. Vehicle in Service Mode.
8. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
    - **If the test lamp does not illuminate**
    1. Vehicle OFF, disconnect the X3 harness connector at the X50A Fuse Block - Underhood.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the X50A Fuse Block - Underhood.
    - **If the test lamp illuminates**
9. Vehicle OFF, connect the harness connector at the S30 Headlamp Switch.
10. Vehicle in Service Mode, exterior lights OFF.
11. Test the voltage between the control circuit terminal 11 and ground for each headlamp leveling switch position listed below.
    - Headlamp leveling switch position 0 - 10 V - 11 V
    - Headlamp leveling switch position 1 - 8.5 V - 9.9 V
    - Headlamp leveling switch position 2 - 8 V - 9 V
    - Headlamp leveling switch position 3 - 6 V - 7 V
    - **If less than the specified voltage range for each headlamp leveling switch position**
    1. Vehicle OFF, disconnect the harness connector at the S30 Headlamp Switch.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the S30 Headlamp Switch.
    - **If greater than the specified voltage range for each headlamp leveling switch position**
    1. Vehicle OFF, disconnect the harness connector at the S30 Headlamp Switch, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the S30 Headlamp Switch.
    - **If within the specified voltage range for each headlamp leveling switch position**
12. Test or replace the appropriate E13 Headlamp Assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Headlamp Replacement**
- Refer to **Headlamp Switch Replacement**

INTERIOR BACKLIGHTING MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

1. Dimmer Switch Malfunction 2. Interior Backlighting Malfunction 3. Switch Indicator Amber LED Backlighting Malfunction				

Circuit/System Description

The headlamp switch is used to increase and decrease the brightness of the interior backlighting components. The headlamp switch provides a voltage signal to the body control module (BCM) that will increase as the brightness of the lights are increased and decrease as the brightness of the lights are decreased. The BCM provides B+, low reference, and signal, circuits to the headlamp switch. When the headlamp switch is placed in the desired position, the dimmed voltage setting is applied from the headlamp switch through the headlamp switch signal circuit to the BCM. The BCM interprets the signal and applies a pulse width modulated (PWM) voltage through the LED dimming control circuits illuminating the interior backlighting to the requested level of brightness.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode, park lamps ON.
2. Verify the scan tool LED Backlight Dimming Command parameter changes between a high percentage to a low percentage while operating the dimmer switch from high to low.
    - **If the parameter does not change**

      Refer to Dimmer Switch Malfunction.

    - **If the parameter changes**
3. Verify the backlighting components turn ON and OFF while commanding the LED Backlight Dimming ON and OFF with a scan tool.
    - **If the backlighting components do not turn ON and OFF**

      Refer to Interior Backlighting Malfunction.

    - **If the backlighting components turn ON and OFF**
4. Vehicle ON, verify the switch indicator amber LED's for the components listed below illuminate when the appropriate switch is commanded ON and OFF.
    - S32LR Seat Heating Switch - Left Rear
    - S32RR Seat Heating Switch - Right Rear
    - S48D Multifunction Switch 2 - Instrument Panel Park Assist Switch
    - S48D Multifunction Switch 2 - Instrument Panel Lane Departure Warning Switch
    - **If the switch indicator amber LED's do not illuminate**

      Refer to Switch Indicator Amber LED Backlighting Malfunction.

    - **If the switch indicator amber LED's illuminate**
5. All OK.

Circuit/System Testing

Dimmer Switch Malfunction

1. Vehicle OFF and all vehicle systems OFF, disconnect the harness connector at the S30 Headlamp Switch, vehicle in Service Mode.
2. Test for B+ between the B+ circuit terminal 12 and ground.
   - **If less than B+**
     1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
     2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
     3. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
   - **If B+**
3. Test for B+ between the B+ circuit terminal 12 and the low reference circuit terminal 7.
   - **If less than B+**
     1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
     2. Test for less than 1 V between the low reference circuit terminal 7 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
     3. Test for less than 2 Ω in the low reference circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
   - **If B+**
4. Verify a test lamp does not illuminate between the B+ circuit terminal 12 and the signal circuit terminal 11.
   - **If the test lamp illuminates**
     1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module.
     2. Test for infinite resistance between the signal circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
   - **If the test lamp does not illuminate**
5. Test for B+ between the B+ circuit terminal 12 and the signal circuit terminal 11.
   - **If less than B+**
     1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
     2. Test for less than 1 V between the signal circuit terminal 11 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
     3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
   - **If B+**
6. Test or replace the S30 Headlamp Switch.

Interior Backlighting Malfunction

NOTE: **Each component with backlighting may need to be disconnected to**

isolate a short to voltage or short to ground. Use the schematics to identify the following:

- **Backlighting components the vehicle is equipped with**
- **Each component's control and ground circuit terminals**
- **Component locations on the backlighting control circuit**

1. Vehicle OFF, all doors closed, all accessories OFF, disconnect the harness connector at the component with inoperative backlighting. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the appropriate ground circuit terminal and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the appropriate control circuit terminal and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the LED Backlight Dimming ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module.
        - X2 terminal 8
        - X7 terminal 9
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the appropriate harness connector listed below at the K9 Body Control Module, vehicle in Service Mode
        - X2 terminal 8
        - X7 terminal 9
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the component with inoperative backlighting.

Switch Indicator Amber LED Backlighting Malfunction

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.

- **If the test lamp does not illuminate and the circuit fuse is open**
  1. Test for infinite resistance between the B+ circuit and ground.
     - If less than infinite resistance, repair the short to ground on the circuit.
     - If infinite resistance, replace the K9 Body Control Module
- **If the test lamp illuminates**

3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Vehicle OFF, disconnect the harness connectors at the components listed below.
   - S32LR Seat Heating Switch - Left Rear
   - S32RR Seat Heating Switch - Right Rear
   - S48D Multifunction Switch 2 - Instrument Panel

NOTE: **The test lamp in the following step will illuminate at LOW intensity. This is normal circuit operation and does not indicate a circuit malfunction.**

5. Vehicle in Service Mode, verify a test lamp illuminates between each control circuit terminal 6 and ground.
   - **If the test lamp does not illuminate**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
6. Verify a test lamp does not illuminate at FULL intensity between each control circuit terminal 6 and ground.
   - **If the test lamp illuminates at FULL intensity**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp does not illuminate at FULL intensity**
7. Test or replace the component with the inoperative switch indicator.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Parking Brake Actuator Switch Replacement
- Refer to Headlamp Switch Replacement
- Refer to Door Lock Switch Replacement
- Refer to Rear Seat Heater Switch Replacement
- Refer to Radio Control Switch Replacement - Steering Wheel (Left Side Lower) Radio Control Switch Replacement - Steering Wheel (Left Side Rear) Radio Control Switch Replacement - Steering Wheel (Right Side Front) Radio Control Switch Replacement - Steering Wheel (Right Side Rear)
- Refer to Hazard Warning Switch Replacement
- Refer to Instrument Panel Center Accessory Function Switch Replacement
- Refer to Control Module References for BCM replacement, programming and setup

PARK, LICENSE, AND/OR TAIL LAMPS MALFUNCTION (MBM)

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

1. Park, License, and/or Tail Lamps Malfunction 2. Park Lamp Switch Malfunction 3. License Plate Lamps Malfunction 4. Tail Lamps Malfunction				

Circuit/System Description

The park lamps, tail lamps, license plate lamps, and side marker lamps are turned ON when the headlamp switch is placed in the PARK LIGHT or LOW BEAM position or anytime the headlights are requested. When the BCM receives a request from the headlamp switch to turn ON the park lamps the BCM will apply battery voltage to the left and right park lamp, side marker lamp, and license plate lamp control circuits illuminating the left and right park lamps, side marker lamps, and license plate lamps.

When the trailer lighting control module receives a request from the headlamp switch to turn ON the park lamps the trailer lighting control module will apply battery voltage to the left and right tail/stop lamp and auxiliary tail/stop lamp control circuits illuminating the left and right tail/stop lamps and auxiliary tail/stop lamps.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Park Lamp Switch parameter changes between Active and Inactive while commanding the park lamps ON and OFF with the headlamp switch.
    - **If the parameter does not change**

      Refer to Park Lamp Switch Malfunction.

    - **If the parameter changes**
3. Verify the left front park lamp and left front and rear side marker lamps turn ON and OFF when commanding the Left Park Lamps ON and OFF with a scan tool.
    - **If the left front park lamps do not turn ON and OFF**

      Refer to Park Lamps Malfunction.

    - **If the left front park lamps turn ON and OFF**
4. Verify the right front park lamp and right front and rear side marker lamps turn ON and OFF when commanding the Right Park Lamps ON and OFF with a scan tool.
    - **If the right front park lamps do not turn ON and OFF**

      Refer to Park Lamps Malfunction.

    - **If the right front park lamps turn ON and OFF**
5. Verify the left tail/stop lamp on the vehicle turns ON and OFF when commanding the Left Rear Stop/Park Lamp ON and OFF with a scan tool.
    - **If the left tail/stop lamp does not turn ON and OFF**

      Refer to Tail Lamps Malfunction.

    - **If the left tail/stop lamp turns ON and OFF**

6. Verify the right tail/stop lamp on the vehicle turns ON and OFF when commanding the Right Rear Stop/Park Lamp ON and OFF with a scan tool.
    - **If the right tail/stop lamp does not turn ON and OFF**

      Refer to Tail Lamps Malfunction.

    - **If the right tail/stop lamp turns ON and OFF**
7. Verify the license plate lamps turn ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
    - **If the license plate lamps do not turn ON and OFF**

      Refer to License Plate Lamps Malfunction.

    - **If the license plate lamps turn ON and OFF**
8. All OK.

Circuit/System Testing

Park Lamp Switch Malfunction

1. Vehicle OFF, all doors closed, all accessories OFF, disconnect the harness connector at the S30 Headlamp Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 8 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Park Lamps Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the signal circuit terminal 5 and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the ground circuit terminal 8.
6. Verify the scan tool Park Lamps Switch parameter is Active.
    - **If not Active**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the signal circuit terminal 5 and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V
    3. Test for less than 2 Ω in the signal circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If Active**
7. Test or replace the S30 Headlamp Switch.

Park Lamps Malfunction

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
3. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
4. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
5. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
6. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module
    - **If the test lamp illuminates**
7. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
8. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the inoperative park lamp.
9. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
    - E4LA Headlamp Assembly - Left terminal 8
    - E4RA Headlamp Assembly - Right terminal 8
    - E2LR Side Marker Lamp - Left Rear terminal 2
    - E2RR Side Marker Lamp - Right Rear terminal 2
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.

  - If 2 Ω or greater, repair the open/high resistance in the circuit.
  - If less than 2 Ω, repair the open/high resistance in the ground connection.
- **If less than 10 Ω**

10. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
    - E4LA Headlamp Assembly - Left terminal 4
    - E4RA Headlamp Assembly - Right terminal 4
    - E4LA Headlamp Assembly - Left terminal 7 (-TR6)
    - E4RA Headlamp Assembly - Right terminal 7 (-TR6)
    - E2LR Side Marker Lamp - Left Rear terminal 1
    - E2RR Side Marker Lamp - Right Rear terminal 1
11. Verify the test lamp turns ON and OFF when commanding the appropriate Park Lamps ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
12. Test or replace the appropriate park lamp.

Tail Lamps Malfunction

1. Vehicle OFF, exterior lamps OFF, disconnect the appropriate harness connector listed below at the appropriate E42 Tail Lamp Assembly.
    - X910 - left tail lamp assembly
    - X920 - right tail lamp assembly
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 1 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Rear Stop/Park Lamp ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.

      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K68 Trailer Lighting Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K68 Trailer Lighting Control Module.
   - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate E42 Tail Lamp Assembly.

License Plate Lamps Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
4. Vehicle OFF, exterior lamps OFF, remove both E7 License Plate Lamp bulbs.
5. Test for less than 10 Ω between each ground circuit terminal 2 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
6. Connect a test lamp between the E7L License Plate Lamp - Left control circuit terminal 1 and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.

   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
8. Connect a test lamp between the E7R License Plate Lamp - Right control circuit terminal 1 and ground, vehicle in Service Mode.
9. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
10. Test or replace the appropriate E7 License Plate Lamp bulb.

Repair Instructions

Perform the Diagnostic Repair Verification after completing the repair.

- Refer to Headlamp Replacement
- Refer to Rear License Plate Lamp Bulb Replacement
- Refer to Rear Side Marker Lamp Replacement
- Refer to Headlamp Switch Replacement
- Refer to Tail Lamp Control Module Replacement
- Refer to Rear Combination Lamp Replacement
- Refer to Control Module References for BCM and trailer lighting control module replacement, programming, and setup

PARK, LICENSE, AND/OR TAIL LAMPS MALFUNCTION (MAH/MBC/MAW/MCX)

Diagnostic Instructions

- Perform the Diagnostic System Check - Vehicle prior to using this diagnostic procedure.
- Review Strategy Based Diagnosis for an overview of the diagnostic approach.
- Refer to Diagnostic Procedure Instructions to provide an overview of each diagnostic category.

Diagnostic Fault Information

Circuit	Short to Ground	Open/High Resistance	Short to Voltage	Signal Performance
F6DA (BCM 4) Fuse B+	B3950 01, B3950 04	B3950 01, B3950 04	-	-
F7DA (BCM 3) Fuse B+	B3949 01, B3949 04	B3949 01, B3949 04	-	-

1. Park, License, and/or Tail Lamps Malfunction 2. Park Lamp Switch Malfunction 3. License Plate Lamps Malfunction 4. Tail Lamps Malfunction				

Circuit/System Description

The park lamps, tail lamps, license plate lamps, and side marker lamps are turned ON when the headlamp switch is placed in the PARK LIGHT or LOW BEAM position or anytime the headlights are requested. When the BCM receives a request from the headlamp switch to turn ON the park lamps the BCM will apply battery voltage to the left and right park lamp, side marker lamp, and license plate lamp control circuits illuminating the left and right park lamps, side marker lamps, and license plate lamps.

When the trailer interface control module receives a request from the headlamp switch to turn ON the park lamps the trailer interface control module will apply battery voltage to the left and right tail/stop lamp and auxiliary tail/stop lamp control circuits illuminating the left and right tail/stop lamps and auxiliary tail/stop lamps.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Park Lamp Switch parameter changes between Active and Inactive while commanding the park lamps ON and OFF with the headlamp switch.
    - **If the parameter does not change**

      Refer to Park Lamp Switch Malfunction.

    - **If the parameter changes**
3. Verify the left front park lamp and left front and rear side marker lamps turn ON and OFF when commanding the Left Park Lamps ON and OFF with a scan tool.
    - **If the left front park lamps do not turn ON and OFF**

      Refer to Park Lamps Malfunction.

    - **If the left front park lamps turn ON and OFF**
4. Verify the right front park lamp and right front and rear side marker lamps turn ON and OFF when commanding the Right Park Lamps ON and OFF with a scan tool.
    - **If the right front park lamps do not turn ON and OFF**

      Refer to Park Lamps Malfunction.

    - **If the right front park lamps turn ON and OFF**
5. Verify the left tail/stop lamp on the vehicle turns ON and OFF when commanding the Left Rear Stop/Park Lamp ON and OFF with a scan tool.
    - **If the left tail/stop lamp does not turn ON and OFF**

      Refer to Tail Lamps Malfunction.

    - **If the left tail/stop lamp turns ON and OFF**
6. Verify the right tail/stop lamp on the vehicle turns ON and OFF when commanding the Right Rear Stop/Park Lamp ON and OFF with a scan tool.
    - **If the right tail/stop lamp does not turn ON and OFF**

      Refer to Tail Lamps Malfunction.

    - **If the right tail/stop lamp turns ON and OFF**
7. Verify the license plate lamps turn ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
    - **If the license plate lamps do not turn ON and OFF**

      Refer to License Plate Lamps Malfunction.

    - **If the license plate lamps turn ON and OFF**
8. All OK.

Circuit/System Testing

Park Lamp Switch Malfunction

1. Vehicle OFF, all doors closed, all accessories OFF, disconnect the harness connector at the S30 Headlamp Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 8 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Park Lamps Switch parameter is Inactive.
   - **If not Inactive**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the signal circuit terminal 5 and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If Inactive**
5. Install a 3 A fused jumper wire between the signal circuit terminal 5 and the ground circuit terminal 8.
6. Verify the scan tool Park Lamps Switch parameter is Active.
   - **If not Active**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the signal circuit terminal 5 and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V
   3. Test for less than 2 Ω in the signal circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If Active**
7. Test or replace the S30 Headlamp Switch.

Park Lamps Malfunction

1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 2 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
3. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**

    1. Vehicle OFF.
    2. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Vehicle OFF.
    2. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
4. Vehicle OFF, connect the X1 harness connector at the K9 Body Control Module.
5. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
6. Verify a test lamp illuminates between the B+ circuit terminal 3 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module
    - **If the test lamp illuminates**
7. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
8. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the inoperative park lamp.
9. Test for less than 10 Ω between the appropriate ground circuit terminal listed below and ground.
    - E4LA Headlamp Assembly - Left terminal 8
    - E4RA Headlamp Assembly - Right terminal 8
    - E2LR Side Marker Lamp - Left Rear terminal 2
    - E2RR Side Marker Lamp - Right Rear terminal 2
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
10. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
    - E4LA Headlamp Assembly - Left terminal 4
    - E4RA Headlamp Assembly - Right terminal 4
    - E4LA Headlamp Assembly - Left terminal 7 (-TR6)
    - E4RA Headlamp Assembly - Right terminal 7 (-TR6)
    - E2LR Side Marker Lamp - Left Rear terminal 1
    - E2RR Side Marker Lamp - Right Rear terminal 1
11. Verify the test lamp turns ON and OFF when commanding the appropriate Park Lamps ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.

        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**

12. Test or replace the appropriate park lamp.

Tail Lamps Malfunction

1. Vehicle OFF, exterior lamps OFF, disconnect the appropriate harness connector listed below at the appropriate E42 Tail Lamp Assembly.
    - X910 - left tail lamp assembly
    - X920 - right tail lamp assembly
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 1 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF when commanding the appropriate Rear Stop/Park Lamp ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K101 Trailer Interface Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K101 Trailer Interface Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate E42 Tail Lamp Assembly.

License Plate Lamps Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.

2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Vehicle OFF.
   2. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
4. Vehicle OFF, exterior lamps OFF, remove both E7 License Plate Lamp bulbs.
5. Test for less than 10 Ω between each ground circuit terminal 2 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
6. Connect a test lamp between the E7L License Plate Lamp - Left control circuit terminal 1 and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If the test lamp turns ON and OFF**
8. Connect a test lamp between the E7R License Plate Lamp - Right control circuit terminal 1 and ground, vehicle in Service Mode.
9. Verify the test lamp turns ON and OFF when commanding the License Plate Lamps ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.

        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**

10. Test or replace the appropriate E7 License Plate Lamp bulb.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Headlamp Replacement**
- Refer to **Rear License Plate Lamp Bulb Replacement**
- Refer to **Rear Side Marker Lamp Replacement**
- Refer to **Headlamp Switch Replacement**
- Refer to **Tail Lamp Control Module Replacement**
- Refer to **Rear Combination Lamp Replacement**
- Refer to **Control Module References** for BCM and trailer interface control module replacement, programming, and setup

REAR COMPARTMENT LAMP MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Rear Compartment Courtesy Lamp Ground	-	1	-	-
1. Rear Compartment Lamp Malfunction				

Circuit/System Description

The body control module (BCM) applies battery voltage to the cargo lamp through the cargo lamp control circuit. When the BCM receives a rear liftgate open input from the rear compartment lid latch, the BCM applies battery voltage to the cargo lamp control circuit illuminating the cargo lamp. In the event that the cargo lamp were to remain illuminated for more than 10 min with the vehicle ON/OFF switch in the OFF position, the BCM will deactivate the cargo lamp control circuit to prevent total battery discharge.

Circuit/System Testing

1. Vehicle OFF, disconnect the X5 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 4 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module
   - **If the test lamp illuminates**
3. Vehicle OFF, connect the X5 harness connector at the K9 Body Control Module.
4. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the E8S Rear Compartment Courtesy Lamp. It may take up to 2 min for all vehicle systems to power down.
5. Test for less than 5 Ω between the ground circuit terminal 2 and ground.
   - **If 5 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 5 Ω**
6. Connect a test lamp between the control circuit terminal 1 and ground, vehicle in Service Mode.
7. Verify the test lamp turns ON and OFF when commanding the Cargo Lamp ON and OFF with a scan tool.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K9 Body Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X7 harness connector at the K9 Body Control Module, vehicle in Service Mode.

        2. Test for less than 1 V between the control circuit terminal and ground.
            - If 1 V or greater, repair the short to voltage on the circuit.
            - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**

8. Test or replace the E8S Rear Compartment Courtesy Lamp.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **Cargo Center Courtesy Lamp Bulb Replacement**
- Refer to **Control Module References** for BCM replacement, programming, and setup

Circuit/System Description

The brake pedal position (BPP) sensor is used to sense the action of the driver application of the brake pedal. The BPP sensor provides an analog voltage signal that will increase as the brake pedal is applied. The body control module (BCM) provides a low reference signal and a 5-volt reference voltage to the BPP sensor. When the variable signal reaches a voltage threshold indicating the brakes have been applied, the BCM will apply battery voltage to the center high mounted stop lamp control circuit illuminating the center high mounted stop lamp.

For stop lamp operation, the trailer lighting control module receives an input from the center high mount stop lamp control circuit. When the brakes are applied on the vehicle, the trailer lighting control module receives the brake applied input from the center high mount stop lamp control circuit. The trailer lighting control module responds by applying voltage to the trailer stop lamp control circuit illuminating the trailer stop lamps. The trailer lighting control module also receives a serial data message from the BCM indicating that the vehicle brakes have been applied. When the liftgate is in the OPEN position, the trailer lighting control module will illuminate the left and right auxiliary stop lamps. When the liftgate is in the CLOSED position, the trailer lighting control module will illuminate the left and right stop lamps.

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Brake Pedal Applied parameter changes between Active and Inactive while pressing and releasing the brake pedal.
    - **If the parameter does not change**

      Refer to Brake Pedal Position Sensor Malfunction.

    - **If the parameter changes**
3. Verify the center high mounted stop lamp turns ON and OFF when commanding the Center Stop Lamp ON and OFF with a scan tool.
    - **If the center high mounted stop does not turn ON and OFF**

      Refer to Center High Mount Stop Lamp Malfunction.

    - **If the center high mounted stop turns ON and OFF**
4. Verify the left and right tail/stop lamps turn ON and OFF while pressing and releasing the brake pedal, liftgate CLOSED.

- **If the left and right tail/stop lamps do not turn ON and OFF**

  Refer to Stop Lamps Malfunction.

- **If the left and right tail/stop lamps turn ON and OFF**

5. Verify the left and right auxiliary tail/stop lamps turn ON and OFF while pressing and releasing the brake pedal, liftgate OPEN.
   - **If the left and right auxiliary tail/stop lamps do not turn ON and OFF**

     Refer to Auxiliary Stop Lamps Malfunction.

   - **If the left and right auxiliary tail/stop lamps turn ON and OFF**
6. All OK.

Circuit/System Testing

Brake Pedal Position Sensor Malfunction

1. Vehicle OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor, vehicle in Service Mode.
2. Test for less than 1 V between the low reference circuit terminal 2 and ground.
   - **If 1 V or greater**
   1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the low reference circuit and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K9 Body Control Module.
   - **If less than 1 V**
3. Test or replace the B22 Brake Pedal Position Sensor.

Center High Mount Stop Lamp Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
   - **If the test lamp does not illuminate and the circuit fuse is good**
   1. Test for less than 2 Ω in the B+ circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
   - **If the test lamp does not illuminate and the circuit fuse is open**
   1. Test for infinite resistance between the B+ circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance, replace the K9 Body Control Module.
   - **If the test lamp illuminates**
3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
4. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the E6 Center High Mounted Stop Lamp.
5. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**

6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
    - E6 Center High Mounted Stop Lamp terminal 1
    - K68 Trailer Lighting Control Module terminal 14 X1
7. Verify the test lamp turns ON and OFF when commanding the Center Stop Lamp ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
8. Test or replace the E6 Center High Mounted Stop Lamp.

Auxiliary Stop Lamps Malfunction

1. Vehicle OFF, exterior lamps OFF, disconnect the appropriate harness connector listed below at the appropriate E51 Tail Lamp Assembly - Auxiliary.
    - X410 - left auxiliary tail lamp assembly
    - X420 - right auxiliary tail lamp assembly
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 2 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF while pressing and releasing the brake pedal, liftgate OPEN.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K68 Trailer Lighting Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module, vehicle in Service Mode.

   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K68 Trailer Lighting Control Module.
   - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate E5 Tail/Stop Lamp - Auxiliary.

Stop Lamps Malfunction

1. Vehicle OFF, exterior lamps OFF, disconnect the appropriate harness connector listed below at the appropriate E42 Tail Lamp Assembly.
   - X910 - left tail lamp assembly
   - X920 - right tail lamp assembly
2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 3 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF while pressing and releasing the brake pedal, liftgate CLOSED.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K68 Trailer Lighting Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X1 harness connector at the K68 Trailer Lighting Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K68 Trailer Lighting Control Module.
   - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate E42 Tail Lamp Assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

    - **If the left and right auxiliary tail/stop lamps do not turn ON and OFF**

      Refer to Auxiliary Stop Lamps Malfunction.

- **If the left and right auxiliary tail/stop lamps turn ON and OFF**

6. All OK.

Circuit/System Testing

Brake Pedal Position Sensor Malfunction

1. Vehicle OFF, disconnect the harness connector at the B22 Brake Pedal Position Sensor, vehicle in Service Mode.
2. Test for less than 1 V between the low reference circuit terminal 2 and ground.
    - **If 1 V or greater**
    1. Vehicle OFF, disconnect the X1 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the low reference circuit and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If less than 1 V**
3. Test or replace the B22 Brake Pedal Position Sensor.

Center High Mount Stop Lamp Malfunction

1. Vehicle OFF, disconnect the X2 harness connector at the K9 Body Control Module, vehicle in Service Mode.
2. Verify a test lamp illuminates between the B+ circuit terminal 1 and ground.
    - **If the test lamp does not illuminate and the circuit fuse is good**
    1. Test for less than 2 Ω in the B+ circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, verify the fuse is not open and there is voltage at the fuse.
    - **If the test lamp does not illuminate and the circuit fuse is open**
    1. Test for infinite resistance between the B+ circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance, replace the K9 Body Control Module.
    - **If the test lamp illuminates**
3. Vehicle OFF, connect the X2 harness connector at the K9 Body Control Module.
4. Vehicle OFF, exterior lamps OFF, disconnect the harness connector at the E6 Center High Mounted Stop Lamp.
5. Test for less than 10 Ω between the ground circuit terminal 2 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
6. Connect a test lamp between the appropriate control circuit terminal listed below and ground, vehicle in Service Mode.
    - E6 Center High Mounted Stop Lamp terminal 1
    - K101 Trailer Interface Control Module terminal 14 X1
7. Verify the test lamp turns ON and OFF when commanding the Center Stop Lamp ON and OFF with a scan tool.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.

        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K9 Body Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X4 harness connector at the K9 Body Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K9 Body Control Module.
    - **If the test lamp turns ON and OFF**
8. Test or replace the E6 Center High Mounted Stop Lamp.

Auxiliary Stop Lamps Malfunction

1. Vehicle OFF, exterior lamps OFF, disconnect the appropriate harness connector listed below at the appropriate E51 Tail Lamp Assembly - Auxiliary.
    - X410 - left auxiliary tail lamp assembly
    - X420 - right auxiliary tail lamp assembly
2. Test for less than 10 Ω between the ground circuit terminal 5 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 2 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF while pressing and releasing the brake pedal, liftgate OPEN.
    - **If the test lamp is always OFF**
    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module.
    2. Test for infinite resistance between the control circuit and ground.
        - If less than infinite resistance, repair the short to ground on the circuit.
        - If infinite resistance
    3. Test for less than 2 Ω in the control circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, replace the K101 Trailer Interface Control Module.
    - **If the test lamp is always ON**
    1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module, vehicle in Service Mode.
    2. Test for less than 1 V between the control circuit terminal and ground.
        - If 1 V or greater, repair the short to voltage on the circuit.
        - If less than 1 V, replace the K101 Trailer Interface Control Module.
    - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate E5 Tail/Stop Lamp - Auxiliary.

Stop Lamps Malfunction

1. Vehicle OFF, exterior lamps OFF, disconnect the appropriate harness connector listed below at the appropriate E42 Tail Lamp Assembly.
    - X910 - left tail lamp assembly

- X920 - right tail lamp assembly

2. Test for less than 10 Ω between the ground circuit terminal 4 and ground.
   - **If 10 Ω or greater**
   1. Vehicle OFF.
   2. Test for less than 2 Ω in the ground circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, repair the open/high resistance in the ground connection.
   - **If less than 10 Ω**
3. Connect a test lamp between the control circuit terminal 3 and ground, vehicle in Service Mode.
4. Verify the test lamp turns ON and OFF while pressing and releasing the brake pedal, liftgate CLOSED.
   - **If the test lamp is always OFF**
   1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module.
   2. Test for infinite resistance between the control circuit and ground.
      - If less than infinite resistance, repair the short to ground on the circuit.
      - If infinite resistance
   3. Test for less than 2 Ω in the control circuit end to end.
      - If 2 Ω or greater, repair the open/high resistance in the circuit.
      - If less than 2 Ω, replace the K101 Trailer Interface Control Module.
   - **If the test lamp is always ON**
   1. Vehicle OFF, disconnect the X1 harness connector at the K101 Trailer Interface Control Module, vehicle in Service Mode.
   2. Test for less than 1 V between the control circuit terminal and ground.
      - If 1 V or greater, repair the short to voltage on the circuit.
      - If less than 1 V, replace the K101 Trailer Interface Control Module.
   - **If the test lamp turns ON and OFF**
5. Test or replace the appropriate E42 Tail Lamp Assembly.

Repair Instructions

Perform the **Diagnostic Repair Verification** after completing the repair.

- Refer to **High Mount Stop Lamp Replacement**
- Refer to **Brake Pedal Position Sensor Replacement**
- Refer to **Brake Pedal Position Sensor Calibration**
- Refer to **Tail Lamp Control Module Replacement**
- Refer to **Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea with Rear Fog)** **Stop and Turn Signal Lamp Bulb Replacement (Europe, Korea, North America with Back-up Bulb)**
- Refer to **Rear Combination Lamp Replacement**
- Refer to **Control Module References** for BCM and trailer interface control module replacement, programming, and setup

TURN SIGNAL LAMPS AND/OR INDICATORS MALFUNCTION

Diagnostic Instructions

- Perform the **Diagnostic System Check - Vehicle** prior to using this diagnostic procedure.
- Review **Strategy Based Diagnosis** for an overview of the diagnostic approach.
- Refer to **Diagnostic Procedure Instructions** to provide an overview of each diagnostic category.

Diagnostic Fault Information

Turn Signal Lamp Ground - Right Front	-	1	-	-
Turn Signal Lamp Ground - Left Rear	-	1	-	-
Turn Signal Lamp Ground - Right Rear	-	1	-	-
Turn Signal/Multifunction Switch Ground	-	2	-	-
1. Turn Signal Lamps and/or Indicators Malfunction 2. Turn Signal/Multifunction Switch Malfunction				

Circuit/System Description

Ground is applied at all times to the turn signal/multifunction switch. The turn signal lamps may only be activated with the vehicle mode switch in the SERVICE MODE or ON positions. When the turn signal/multifunction switch is placed in either the turn right or turn left position, ground is applied to the body control module (BCM) through either the right turn or left turn signal switch signal circuit. The BCM responds to the turn signal switch input by applying a pulsating voltage to the front and rear turn signal lamps through their respective control circuits. When a turn signal request is received by the BCM, a serial data message is sent to the instrument cluster requesting the respective turn signal indicator be pulsed ON and OFF.

Diagnostic Aids

The tail lamp outage detection circuits are low current B+ circuits that will not illuminate a test lamp.

Scan Tool Reference

Control Module References for scan tool information

Circuit/System Verification

1. Vehicle in Service Mode.
2. Verify the scan tool Right Turn Signal Switch and Left Turn Signal Switch parameters change between Active and Inactive while cycling the turn signal switch between the right and left positions.
    - **If the parameters do not change**

      Refer to Turn Signal/Multifunction Switch Malfunction.

    - **If the parameters change**
3. Verify the left front turn signal lamp and turn signal repeater lamp turn ON and OFF while commanding the Left Front Turn Signal Lamp ON and OFF with a scan tool.
    - **If the left front turn signal lamp does not turn ON and OFF**

      Refer to Turn Signal Lamps Malfunction.

    - **If the left front turn signal lamp turns ON and OFF**
4. Verify the right front turn signal lamp and turn signal repeater lamp turn ON and OFF while commanding the Right Front Turn Signal Lamp ON and OFF with a scan tool.
    - **If the right front turn signal lamp does not turn ON and OFF**

      Refer to Turn Signal Lamps Malfunction.

    - **If the right front turn signal lamp turns ON and OFF**
5. Verify the left rear turn signal lamp turns ON and OFF while commanding the Left Rear Turn Signal Lamp ON and OFF with a scan tool.
    - **If the left rear turn signal lamp does not turn ON and OFF**

      Refer to Turn Signal Lamps Malfunction.

    - **If the left rear turn signal lamp turns ON and OFF**
6. Verify the right rear turn signal lamp turns ON and OFF while commanding the Right Rear Turn Signal Lamp ON and OFF with a scan tool.
    - **If the right rear turn signal lamp does not turn ON and OFF**

      Refer to Turn Signal Lamps Malfunction.

    - **If the right rear turn signal lamp turns ON and OFF**
7. Verify the left and right turn signal indicators turn ON and OFF while commanding the Instrument Cluster Gauge Sweep Test ON and OFF with a scan tool.
    - **If the left or right turn signal indictors do not turn ON and OFF**

      Refer to Turn Signal Indicators Malfunction.

    - **If the left and right turn signal indictors turn ON and OFF**
8. All OK.

Circuit/System Testing

Turn Signal/Multifunction Switch Malfunction

1. Vehicle OFF, scan tool disconnected, all doors closed, all accessories OFF, disconnect the harness connector at the S78 Turn Signal/Multifunction Switch. It may take up to 2 min for all vehicle systems to power down.
2. Test for less than 10 Ω between the ground circuit terminal 3 and ground.
    - **If 10 Ω or greater**
    1. Vehicle OFF.
    2. Test for less than 2 Ω in the ground circuit end to end.
        - If 2 Ω or greater, repair the open/high resistance in the circuit.
        - If less than 2 Ω, repair the open/high resistance in the ground connection.
    - **If less than 10 Ω**
3. Vehicle in Service Mode.
4. Verify the scan tool Left Turn Signal Switch parameter is Inactive.
    - **If not Inactive**
    1. Vehicle OFF, disconnect the X3 harness connector at the K9 Body Control Module.
